A GENTLEMAN went into a restaurant in this city a few days ago with a friend, ordered his dinner, and, when the beef-steak made its appearance, ate it so fast that a piece stuck in his throat. He was carried to the hospital as rapidly as possible, an incision made, and the piece of meat extracted; but it was too late, he was dead. This is the most striking illustration of the dangers of fast eating we remember to have met with, and we commend it as such to lecturers and writers of books on the popular and interesting subject of "hygiene." People for whom dyspepsia has no terrors may possibly be frightened by the possibility of strangulation, and the time spent in dining be thus made to undergo a sensible prolongation. But we doubt very much whether even "awful examples" would do much for the great cause of slow eating. With many people fast eating is a habit contracted in childhood, and which becomes as much a part of them, when they grow up, as their gait, or their way of holding their heads. Children acquire it either through an unusually voracious appetite or through early exposure to undue competition at meals. When acquired later in life, as it usually is amongst us, the habit is apt to originate in dining in the middle of the day, that is, in the midst of the business hours of the busiest community in the world—a practice which originated when most men were farmers or soldiers, and when nearly all the thinking of the world was done by monks, but which in the middle of the nineteenth century in an American city is an anachronism and worse. No business or professional man can go to a one o'clock dinner and bring to the processes of mastication and digestion the repose necessary for the successful performance of either. Early dinners ought to be the luxury of the idle; for men who are not prepared for them by an open-air life, and who are compelled to hurry from them back to offices and stores, they are simply a kind of slow poison, and they poison more rapidly as the pressure of the various pursuits in which city men are engaged increases. The lawyer who stuck up on his office door, "Gone to dinner; back in ten minutes," might as well have added, "I am killing myself by bolting my food, and then trying to digest it over my papers; at forty-five I shall probably be either a broken-down invalid or a lunatic, but, in the meantime, I am very much at your service." There is also a ghastly humor about that other story of the host in a New England city who asked his guest, at a mid-day dinner, if "he would mind eating his pie in the street as they walked along." The doctors help to keep the practice up by preaching against "late dinners" and telling people that they cannot digest much food when they come home in the evening hungry and exhausted with the day's labor, as if that was not the very time and very condition in which people most need a good meal, or as if evening was not the hour at which the vast majority of the human race ate their principal repast, at this day. It is the hour, too, in which the mind enjoys most repose, most freedom from responsibility, and after which most people are sure of leisure. Of course those who usually dine at one find, what with the effect of habit on the stomach and the effect of doctors on the imagination, a dinner at six rather heavy; but we venture to assert there is not half as much dyspepsia amongst those who dine at six all the year round as there is amongst the worshippers of one o'clock. It must be remembered, too, that over-eating is as bad a thing at night as at noon, and anybody who relies on afternoon exercise to enable him to dispose of a surfeit will, of course, find a late dinner inconvenient. But, to the great mass of business men, the opportunities for successful digestion after six o'clock are good, while between one and six they may be said to enjoy none whatever.

GREEN, the Malden murderer, went into a bank in broad daylight in a quiet New England village, killed the clerk, robbed the safe, and went about his business. He is now under sentence of death, and an effort was made to secure his pardon on the ground of hereditary insanity. "Two Citizens of Malden" have recently spent an hour with the prisoner, and have written an account of the interview for the Boston *Advertiser*, containing, besides a description of the prisoner, an account of their own emotions and a theory of the cause of the crime. The "primary cause of the murder," they hint rather than assert, was "poor stock." It appears that insanity had shown itself in the Green family for several generations back. His paternal grandfather and several of his granduncles on the same side were insane. On the maternal side his uncle is insane, his grandfather was idiotic, and one of his granduncles committed suicide. All this is rather startling, and well calculated to support any facts that can be adduced in proof of Green's own insanity. But no such facts have been brought forward. The insanity of one's ancestors is not proof either legal or moral of one's own; for this, like other diseases, often skips a generation, and if proof of ancestral aberrations would sustain a good plea in bar, we might as well shut up the jails, for there are but few men who have not had progenitors on either the paternal or maternal side who have at least acted oddly. Green's mother was a drunkard, but the worst things told of his father are that he kept a store and afterwards was a postmaster. His children by his first marriage, of whom the prisoner is one, appear to have been deficient in character, but we must say that the fact recorded by the "Two Citizens of Malden," that "they did not amount to anything," is, for either psychological, physiological, or judicial purposes, of very little value. Of how many children may the same remark be made! The information which the "Two Citizens" have secured as to Green's own boyhood hardly warrants the assertion that they make, that his was a "social nature of a low but not a brutish order." The facts on which this conclusion seems to be based are the following:

"To have 'a good time' was all he cared for; but he was not addicted to any vice. He was neither sensual nor a drunkard. To be popular with the school children; to have a ride and a pleasant party as often as was possible; to secure a comfortable home for his wife, to whom he was devotedly attached—these ends and aims formed the *Ultima Thule* of his hopes and ambition."

We believe this would describe the boyhood and early youth of at least eight men out of every ten. The number of those who look forward to squaring the circle, or writing an immortal epic, or, like Mr. Johnson, being somebody's "Moses," or being elected President, is very small. The conduct of the great mass of mankind in early and often in middle life is, like that of Green, regulated by the desire to be popular with their neighbors, and to provide comfortable homes for their wives, and to be invited "to parties" as often as possible. We venture to assert that the worldly ambition of two-thirds of every community rarely goes beyond this, or, in the nobler language of the "Two Citizens," "these ends and aims form the *Ultima Thule* of their hopes and ambition." But we think it would be very unfair to conclude that "their social nature" is, for this reason, "of a low order," and we know of nothing better calculated to confuse popular notions of right and wrong, or at least diminish the popular horror of crime, than disquisitions like the one before us, in which it is insinuated that the fact of a man's love for a humdrum domestic life argues a low degree of accountability.

The special attention of the reader is directed to the Financial Review on another page. Its place among the advertisements is by no means significant of its value, but is resorted to only that we may obtain the latest intelligence of the market.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

ANDREW JOHNSON ON CIVIL RIGHTS.

THE objections of Mr. Johnson to the bill recently passed by Congress to secure the civil rights of the people of the United States are entitled to consideration on account of his office, whatever we may think of their intrinsic value or of his personal capacity to judge of such questions. There are few public men whose opinion upon a point of constitutional law would have attracted less attention a year or two ago than Mr. Johnson's, and we are inclined to believe that there are few whose judgment will carry less weight after his official term has expired. For the present, however, they are of undeniable importance.

The President's objections are two-fold: first, on constitutional grounds, and second, on grounds of policy. We propose to discuss the two classes of objections separately.

The provisions of the bill which, Mr. Johnson thinks, violate the Constitution are three. First, the abrogation of State laws discriminating between the civil rights of persons differing in color. Second, the provision for the punishment of persons violating the first section of the bill itself. Third, the new jurisdiction conferred upon the Federal courts.

The first objection is, of course, the principal one. Congress has interpreted the Constitutional Amendment abolishing slavery as authorizing the enactment of laws to prevent the continuance of unequal State laws, which were notoriously incidents of the slaveholding system. The President seems to hold a different theory. We had supposed that, under the rule of construction adopted by the Supreme Court of the United States, there could no longer be any doubt that Congress could adopt any measures that might probably be necessary to exercise the powers conferred on it, or to carry out the mandates of the Constitution. Now, it is true that men might be deprived of the civil rights mentioned in this bill, and yet not be actually enslaved. But it is also true that a man might be subject to be whipped by any and every other man, and yet not be a slave. He might be compelled to work without wages, and yet not be, within the definition of the Southern codes, a slave. He might have no rights over or in his wife and children, and still not be a slave. He might be prohibited from learning to read, from learning a trade, from travelling outside of his own village, from selling the fruits of his labor, or from owning the coat on his back, and yet not be a slave. But put all these burthens together upon one man, and wherein does he differ from a slave?

If, then, Congress is to have power to interfere with slavery at all, it must have the power to remove every shackle which belongs to the policy of slavery and which constitutes a link in its chain. And surely there can be no doubt that, upon the deprivation of civil rights and upon a system of unequal punishments, a new scheme of slavery might be founded. Slavery for *crime* is not prohibited. Suppose, therefore, that a State should enact that it should be a felony for any colored person to remain in the State for ten days, and that the punishment should be slavery for life? Statutes in substance like this have been passed before and enforced, and might well be again. Or, suppose that a law should be passed absolutely prohibiting colored persons from suing or defending suits. How could they escape out of slavery in such case? Or, suppose the mild and beneficent law of reconstructed and loyal (!) Mississippi, which absolutely forbids colored men from owning or leasing real property, should be enlarged by adding a section making it a misdemeanor for them to trespass upon any land which they did *not* own or hire (which is the law of this State), how easy would it be to reduce the whole colored population to slavery. Add to this the laws which have already been passed in several reconstructed States for the apprenticeship of colored children without the consent of their parents, irrespective of their ability to support them, and what more is needed to constitute slavery more brutal and destructive, by far, than the old and undisguised system? It would be slavery without the salutary check of a pecuniary interest in the life of the slave; and the lot of the colored "freedman," like that of the Cuban *emancipado*, would be ten times worse than that of the old-fashioned slave. If Congress has no power to hinder these plans from being carried out, the Constitutional Amendment is an imposture and emancipation a farce. It is true that, in doing this, Congress may possibly adopt measures that, in some instances, will effect more than is really necessary for the purpose. But this is true of all laws. It is almost impossible to frame a statute which shall do all that its authors intended and yet not do a hair's-breadth more.

The next objection is to the second section of the bill, which provides for the punishment of "any person who, under color of any law, statute," etc., subjects, or causes to be subjected, any person to the deprivation of rights conferred on him by the first section. This, Mr. Johnson says, punishes legislators who pass unequal laws, and judges who expound them. As far as legislators are concerned, the objection is so utterly unfounded as to remind us of a kindred passage in the veto of the Freedmen's Bureau bill, in which the language of the bill was directly falsified in order to make a forcible point. How is it possible that legislators can be said to act "under color of law?" They *make* law, they do not *act under* it. It might as well be claimed that all who voted for a legislature which passed such laws are punishable under this bill. Nor do we think that under any fair interpretation judges could be held to fall under the penalties of the bill. The whole phraseology of the section contemplates *acts*, not decisions, and is clearly aimed at ministerial officers, such as sheriffs, constables, etc. As to them, even Mr. Johnson has not the hardihood to deny the power of Congress to punish their acts. Mr. Johnson finds something in the third section which confirms his views as to the meaning of the second section. Our obtuseness is such that we cannot perceive the faintest glimmerings of light in that direction, and cannot therefore enter upon an argument for which we do not discover the least foundation.

It is, of course, possible to put upon the provisions of this or any other bill a construction as forced as that which the President has adopted in reviewing the civil rights bill. Under such a method of interpretation, scarcely any penal law could stand. Thus, we take at random the statute of this State in respect to counterfeiting. It declares, in the plainest terms, that every person who "counterfeits" a gold or silver coin, current by custom or usage, shall be punished as for forgery. Many boys amuse themselves by taking moulds of coins, in lead or other soft metals, without, of course, the slightest idea of using them to defraud, and without the possibility of doing so. According to Mr. Johnson's mode of interpretation, all these children are liable to be sent to the State prison. So the proposed penal code of this State makes it a misdemeanor wilfully to delay a public officer in the discharge of his duty. Upon Mr. Johnson's theory, it would follow that if this provision is adopted it will be a crime to stop a constable, on his way to an arrest, merely to ask him the time or to shake hands. Absurd as are these illustrations, they are not a whit more absurd than the President's construction of the second and third sections of the civil rights bill. Yet it is this branch of his argument which, the New York *Times* is of opinion, must have made Chief-Justice Poland and Judges Harris and Trumbull "blush" to find their legal learning surpassed by a layman. We can easily conceive that they blushed on reading the veto message; but, we fancy, from a very different reason from that hinted at by the *Times*.

The last of the constitutional objections is, that the Constitution does not allow an extension of the judicial power of the United States to the cases of which, under this bill, the Federal courts are to take cognizance. This objection depends entirely upon the first one. If the bill is in other respects constitutional, then Congress has unquestionable power to give jurisdiction to the Federal courts over all cases arising under the bill. This is plainly shown by the very section of the Constitution which the President cites on this point.

We have thus briefly reviewed the President's objections to the constitutionality of the bill, and trust that we have made it clear that they are entirely unwarranted. We now approach the other class of objections, which we find much more difficult to treat with respect. They savor of the demagogue and the stump, and are more worthy of Mr.

Rogers, of New Jersey, when addressing his constituents, than of the President of the United States addressing the whole continent, and, indeed, the whole civilized world!

The first objection, on mere grounds of expediency, which is raised by the President, is to the clause declaring persons of color to be citizens of the United States. The simple fact of his making this objection is a melancholy proof of Mr. Johnson's rapid retrogression from liberal principles. It is only a few months since he publicly addressed a crowd of colored men as his fellow-citizens. Now he is disposed to treat them as aliens and foreigners. Nay, he thinks they are not as fit for admission to citizenship as foreigners. Adopting one of the meanest and most untruthful arguments of mob orators, he asserts that the bill makes a discrimination against "intelligent, worthy, and patriotic foreigners, and in favor of the negro," because it admits the latter race, which has been here for two hundred years, to citizenship without waiting five years more, or going through the form of naturalization, which is notoriously so administered as to have become a fiction and a sham.

The President's mania for State-rights is amusingly exhibited in dealing with this question. After admitting that the Federal Government has exclusive control over the subject of citizenship of the United States, he objects to the admission of negroes to this privilege on the ground that "the people of the several States" have not expressed their conviction of its propriety. What have the people of the *several* States to do with it? The people of the *United States* have expressed their convictions, in the only legitimate way, by the votes of Congress. That ought to suffice even for Mr. Johnson.

Another objection is made to the authority given to the Federal courts to appoint commissioners without limit as to number, and to these commissioners to appoint persons to execute warrants and other processes. To Mr. Johnson's heated imagination a cloud of police, multitudinous as the frogs of Egypt, arises to darken the land. Yet all these provisions were literally copied from a somewhat famous statute passed in 1850, and for which Mr. Johnson himself voted. Nor was it ever found that, under that law, any extraordinary number of persons was appointed. In fact, other acts of Congress, which have been in force for more than fifty years, contain similar provisions; and the worst that can be said of the clauses which excite the alarm of Mr. Johnson is, that they are needless repetitions of existing laws.

The same answer may be made in substance to Mr. Johnson's objections to the "irresponsibility" of these agents, to the fees allowed them for their services, to the possibility of their abuse of power, and to their interest in creating mischief for the sake of fees. All these objections apply to every marshal, sheriff, and constable in the land. They are incidental to every judicial system. Sheriffs would make a poor living if there were no litigation. Therefore, let all sheriffs be removed, so as to put an end to litigation. Policemen would be all discharged if there were no thieves or rioters. Therefore let all policemen be discharged, and the land will be immediately cleansed from theft and riot. The argument is profound, but not quite convincing.

The remaining objections to the details of the bill refer to the provisions requiring the courts to sit in any place appointed by the President, and authorizing the use of the army, navy, or militia to enforce the law. It is only necessary to say, as to these points, that similar provisions exist in other laws of the United States, and of the "several States" for whose opinion Mr. Johnson is so anxious. The former provision is familiar law in this State, and the latter provision is copied from another Federal statute for which Mr. Johnson voted in former days.

We have striven to speak temperately of this extraordinary message, and to repress the feeling of impatient contempt which its dishonest evasions and unworthy clap-trap have aroused. But justice to the subject demands that we should plainly express our judgment that this message is one of the most discreditable state papers known to American history. Taking into view all the circumstances in each case, Chief-Justice Taney's celebrated opinion becomes almost respectable by comparison. In full view of the legislation of Louisiana, Mississippi, and other reconstructed States, which the President has been compelled, by his own sense of decency, to set aside, he has the hardihood to say that the conflicting legislation contemplated by the bill is not likely to occur. In the face of the same notorious facts he asserts that there has not been, nor is there likely to be, any attempt to revive slavery by the people of any State. So, after expressly denying the power of Congress to secure to the freedmen any right to sue, to testify, to hold property, to make or enforce contracts, to marry or be given in marriage, he calmly assures Congress that he will "cheerfully" co-operate with it in any constitutional measures to preserve to the freedmen their *civil rights!* In the name of heaven and humanity, what *are* civil rights if those which we have enumerated are *not* included under that term?

THE EXECUTIVE LEGISLATING.

THERE has been such a glamour thrown round the presidential office by the war that a great many people seem to have totally forgotten the precise nature of the President's relations to Congress and the country. And it is because they have forgotten it that the present conflict between the legislature and the Executive possesses much political importance. We are, in reality, witnessing at this moment, in the difference which convulses the country, the legitimate result of the departures from constitutional usage into which we were driven in the excitement and confusion of 1861. Nobody can, perhaps, be fairly blamed for the irregularities into which the Government then fell. They were the natural result of the alarm and anxiety and distrust of everybody and everything by which the nation was pervaded. But there is no denying the fact that our political machine received a severe jar on the day when Mr. Lincoln was allowed, of his own mere notion, to exercise the very highest power of government, the power of suspending the *habeas corpus*. Congress ought not to have lost a moment after its meeting in asserting its sole exclusive authority to meddle for any purpose whatever with the safeguards placed by the common law and the Constitution round individual liberty. The tameness with which it suffered this prerogative to be taken from it, and with which it submitted to divers other assumptions by the Executive of functions peculiarly legislative, are now bearing their legitimate fruit. People begin to see at last that disregard of the forms of law is a two-edged sword, and that although it may in the hands of a good man strike great blows for freedom, it may on the morrow, and in the hands of a bad man, strike almost as effective blows for slavery. From Mr. Lincoln's right to suspend the *habeas corpus* by proclamation Mr. Johnson's right to restore it by proclamation is a fair deduction. So that under this precedent Congress has practically lost all control over the Southern States. Mr. Johnson may to-morrow restore the writ throughout the South without consulting the legislature; and this done, the Unionists and negroes would be absolutely at the mercy of the secessionists.

A more remarkable example still of the mental confusion remaining from the war is shown in the course which Mr. Johnson has thought himself authorized to take in the matter of reconstruction. When the Southern armies had surrendered, and all appearance of resistance had ceased, the "war power" of the President permitted him simply to provide security for life and property while the people of the States were getting the machinery of civil government into order. The President with his "war power" is, and can only be, under any construction of it, the commander-in-chief of the armies of the United States, and on soil from which he has driven the public enemy; he exercises the power of a general in the field—no less and no more. The duties of a general in the field, after fighting is over, are the restoration of order and the creation of such means of administering justice as may be necessary and expedient. All else—the nature of the government to be established, the process by which it is to be established, the relations of the conquering to the conquered State—are matters for the decision of the legislature in all constitutional countries. If the President has power to settle these things, he is more than a general—he is a despot. If he unites in his own person legislative with executive powers, he is not the servant of the people, but its master. He exercises an authority such as has never been assumed before in any country calling itself free, by any officer of the government.

At the close of the war Mr. Johnson appointed provisional governors. So far all was well; executive officers of some sort there had to be to prevent anarchy. He went further, and called conventions to re-organize the governments. This, too, was not open to objection. He was still acting within his sphere as commander-in-chief. The various States needed to have some means of expressing their wishes. But this is as far as we can go with him. He had no business to make discriminations between classes of the citizens. He, as commander-in-chief, had nothing to do with State policy or State laws. His duty was to see that all had a hearing; when he decided who should vote and who should not, he *legislated*, and consequently was guilty of usurpation. But, at all events, once the conventions had met, he was as a holder of the war power *functus officio*. He should then have called Congress together and said: "The rebellion is over; the South is at your mercy. I have re-established order; I have provided the people of the revolted States with the means of addressing you. You are the legislature of the United States; in your hands the Constitution has lodged the power of initiating all laws and all schemes of policy. My duty, the duty assigned me by the Constitution, is to report to you and make suggestions to you, and to carry into execution such laws as you may pass, either with my approval, or in spite of my disapproval. I recommend you to treat the South leniently; to receive the return of the revolted States to the Union with as little humiliation to them as possible; but it is for you to decide. I shall express my opinion in the constitutional way on such bills as you may send for my signature; should my objections to them be deemed by you insufficient, I shall not forget that I am your executive officer; that 'all legislative (that is, all law-making) powers' are, by the Constitution, expressly 'vested in the Congress of the United States (Sec. 1), and that Congress consists of the Senate and House of Representatives;' that all that I have to do with the law-making is to 'recommend to your consideration such measures as I shall judge necessary and expedient.'"

He, however, did nothing of the kind. He did not call Congress together. He did not wait for its coming together. He set to work to make laws with great assiduity. He issued edicts with a rapidity equal to that of Louis Napoleon in December, 1851. He first of all arbitrarily excluded all colored men from voting. He next arbitrarily excluded all persons from voting who had taken part in the rebellion, thus, on his own authority, inflicting a penalty of the highest kind on persons who had been neither tried nor convicted of any crime whatever. He then—we beg the reader's attention to this point—began to exact certain qualifications from revolted States as conditions of their re-admission into the Union. He insisted that they should formally abolish slavery, that they should repeal the ordinances of secession, that they should repudiate the rebel debt. Now the power that makes such requirements as these of any people must be either a conqueror exercising the naked authority of the sword on conquered soil, or a legislature exercising a constitutional right. The first of these Mr. Johnson has always stoutly denied that he is or can be; the second the Constitution does not permit him to be; so that on every theory that has yet been propounded by himself or his friends, or that can be devised, of his position and duties, the whole reconstruction process, as he has carried it on, has been one long piece of usurpation, in which we are satisfied few loyal men at the North would have thought for one moment of acquiescing, if most of us had not been frightened by the war into forgetfulness or indifference to the true relations between the different branches of our government.

The whole work of re-organizing the South and restoring its relations with the Union is the most important kind of work on which a government can enter. It consists in law-making in the highest sense of the word. In a free country it is the legislature only which is capable of it. In this country the performance of it is expressly forbidden to anybody but the legislature. The phrase, "the President's policy," which is now heard so often, is a solecism of which no American who knows the nature of his own institutions ought to be guilty. The President has *opinions;* he ought not to have a policy. It is for Congress to frame a policy; it is for him to carry it out. As matters stand, he not only framed a policy without consulting Congress, but he went to work to carry it out, and, when Congress met, they found the work half done. This was bad enough in all conscience; but this was not all. When they met, and took the state of the South into consideration, they came to the conclusion that the conditions he had imposed on the revolted States were not sufficient, and proceeded to impose others. But they have found that not only has he arrogated the power of imposing conditions himself, but he maintains that any attempt of the legislature to add to his list is an usurpation, against which he feels it to be his duty to offer every opposition in his power. He denies the right of Congress to revise his work or to amend it; tells them to their faces that, if they presume to legislate about the South, they must take Southern representatives into their councils, just as if he consulted Jefferson Davis when he was about to draw up *his* conditions of reconstruction. He appeals to the Constitution as coolly as if the Constitution authorized the President to dictate to constitutional conventions the provisions of the organic law which they were to frame, or authorized him to drive from the polls at local elections whole classes of men who had been neither indicted, tried, nor convicted, or to maintain martial law in time of peace, or, in fact, to do any one of the acts by which he has sought to bring back the Southern States to their old position.

We confess that for our part we think the public acquiescence in the unwarrantable assumptions of power on which the President's whole interference with the reconstruction process is based, has gone far enough. Whatever excuse there might have been for it three years or even one year ago, there is none now. It is too late to undo the irregularities committed during the war; but it is not too late to force every branch of the Government to betake itself once more to its own business, and confine itself to the sphere traced out for it by the Constitution. We want no "deliverers," or "restorers," or "chieftains," or "Moseses;" no great man with a "mission" to get us out of our difficulties. If the legislative branch of our system be not equal to the present crisis, our institutions are a failure. But the people have not come to the conclusion that the old machinery is not still equal to all the work that may be required of it. It is not probable that the confusion which now pervades the minds of a portion of the public regarding the President's duties can last very long. It would probably not have lasted even as long as it has were it not that the present controversy is one which touches the negro more nearly than the white man, and the influence which the negro exerts in bemuddling the intellects and blunting the perceptions even of the most sensible people, is one of those things which, as we have often remarked before, we are glad to say it is not our duty to explain.

THE REFORM BILL IN ENGLAND.

While Americans are called on at this moment to decide questions which directly involve the fundamental principles of government, labor, and society, Englishmen are engaged in discussing the respective merits of a seven-pound rental and a seven-pound rating franchise. Tory and Whig, Liberal-Conservative and Conservative-Liberal, appear to us mere party appellations, to which it is hard to attach any real significance. Whether Lord George comes in or Lord John goes out of office can hardly be a matter about which we feel any very keen interest. But yet, underneath the seemingly meaningless and petty character of the English political contests of the day, many genuine and important principles are at issue. What those principles are, let us try to explain as distinctly as we can.

The reform bill of 1832 has often been aptly described as a social revolution. In spite of many shortcomings and much disappointment, it produced one great real result: it transferred the supreme power from the landed aristocracy to the middle classes, after much the same fashion as the revolution of 1688 transferred the supreme power from the crown to the aristocracy. The government did not cease to be one conducted mainly by the aristocracy; but, in the event of a contest of opinion, the casting-vote, so to speak, was taken from the peerage and landed gentry and given to the commercial and middle classes. The proof of this change may be found in the fact that no measure on which the middle class really set their heart has ever been permanently

rejected by the opposition of the aristocratic influence, and that no measure opposed to their instincts has ever become law. In ordinary times, and upon common questions, the country is quite content to leave the administration of affairs to the ruling caste, knowing that, whenever it chooses to exert its power, it can dictate the policy to be pursued. The political questions on which the middle classes are in earnest or united are not many in number, and therefore this power is seldom exercised decisively, but it exists none the less.

The reform bill which destroyed, to a great extent, the pocket borough system, and gave the largest share in the representation to householders, tradesmen, and professional men, was carried as a liberal measure by the aid of the popular party. Gradually the masses, to whose assistance its success was partly, perhaps mainly, due, discovered that, as far as they were concerned, it had not fulfilled their expectations. If contemporary accounts can be believed, the ideas entertained at the time of what reform was to effect were so extravagant that there could not fail to be much subsequent disappointment. But even reasonable and moderate men, who would have laughed to scorn the popular idea that a change in the representation would forthwith destroy poverty, were justly dissatisfied. The working masses discovered that they had very little, if anything, more of political power than they had before the reform bill, and that they had assisted in changing an oligarchy into a middle class monopoly. The change was one infinitely for the better, but it was not what they had expected or desired. Thus, imperceptibly almost, the attitude of the different classes in the state has changed. The middle class has virtually assumed a defensive instead of an offensive position; like any other class, having got power into its own hands, it wants to keep it, and looks jealously at any attempt to deprive it of its monopoly.

Of course such an explanation must be taken subject to many limitations. The middle class is such an enormous one in England, and shades off so imperceptibly into the aristocracy at one end and into the laboring population at the other, that it is almost impossible to define it by any distinct designation. Then, too, the leaders of the popular party belong almost without exception to the middle class; and, what complicates the question still further, this class is, on the whole, favorable to Liberalism—in the abstract. Nor are their liberal proclivities at all insincere. They wish sincerely to govern the country liberally, but they wish to keep the supreme power of government within their own hands, and they are sadly at a loss to reconcile this wish with their theoretical principles.

Under the present electoral laws the great middle class is most adequately represented. No doubt there are many anomalies by which individuals suffer exclusion from the franchise; but practically the class has no reason to complain. Now, by extending the franchise sufficiently to let in the working class to the electoral body, the whole distribution of political power will be altered. The numerical preponderance of laboring men over all and any other class in the country is so great that they would obtain that share in the representation at present enjoyed by the class above them. This is the plain English of the whole matter; and the more plain it is made to them, the less the middle class as a body like the idea. If the franchise were to be given to six-pound householders, the existing half million of voters would have to divide their power with another million of electors, all belonging to the operative section of the community.

Thus the contest on which the English people are now entering is really one for the transfer of power from the middle to the working class. If it were effected, the administration of the country would doubtless remain for years to come in the hands of the aristocracy, the squirearchy, and the upper ten thousand; the difference would be that the Government would necessarily be conducted with deference to the convictions and prejudices of the masses; and this difference would be a very great and a rapidly increasing one. Now this is a result for which the ruling classes are by no means prepared. The aristocracy are, of course, hostile to any alteration which tends inevitably to increase the power of the democratic element, and a very large section, if not a decided majority, of the middle classes are disposed to side with them. The Liberal party itself is divided on the question, and a very important and respectable section cannot make up its mind one way or the other. The "thoughtful Liberals," as this section delights to call itself, are in a hopeless muddle. They are in the old dilemma that we have all been in as children—they want to eat their cake and have it. They feel the injustice of excluding working-men from the electoral body, and yet they cannot stomach the notion of giving them political power. So they suggest all kinds of ingenious devices, fancy franchises, plurality votes, representation of minorities, etc., by which the working classes should have a share in the representation, but only such a share as would leave the supremacy of the present holders of political power unaltered and unquestioned.

Meanwhile, the working classes themselves remain apparently indifferent. The reasons of this apparent unconcern are, we judge, twofold. In the first place, wages are and have been very high for the last few years, and though in particular districts there is great and long-continued distress, yet, on the whole, the condition of the working classes has improved so much under the influence of free trade that they are not disposed to agitation, and without agitation any solid reform is impossible. In the second place, the leaders of the reform movement have been so anxious to avoid alarming the upper classes, that they have lost no opportunity of asserting that they contemplated no radical changes of any kind. In so doing they have overshot their mark. They have not removed the instinctive dread entertained by the upper ten thousand of any change which would give the working men the power to return a majority of the House of Commons, and they have paralyzed the enthusiasm of the working classes. If it were true, as liberal organs of opinion perpetually assert, that everybody is very well contented with things as they are, and that a reformed Parliament would consist of much the same men and pursue much the same policy as the existing one, why, except as a matter of abstract sentiment, should the unrepresented classes care for a vote? Mr. Bright and his colleagues know perfectly well that a Parliament elected by working-men would do many things and leave many things undone which the present legislature would not dare to do; but till they can summon up courage to announce boldly the changes they hope to inaugurate by lowering the franchise, they cannot expect to create any enthusiasm for reform. In England the public is not to be moved for an abstract idea. If you declare that, with a six-pound rental qualification, you expect to establish compulsory secular education, to do away with the county magistracy, to establish the game laws, to inaugurate vote by ballot, or to make any sweeping vital change, you will arouse at once the most vehement and bitter opposition, but you will also create a popular feeling in favor of your proposal which may ultimately secure its success.

Now the House of Commons is, as usual, a very faithful representative of the classes by whom it is elected. There are a certain number of advanced Liberals who wish for a reform, because they know perfectly well it will make the Government more democratic in its character; but this section is a small though important minority. Five-sixths of the members, to say the very least, have no real wish for a reform bill at all. A great proportion are so hampered with hustings pledges, so bound by promises made in the hope that their fulfilment would never be called for, that they would gladly welcome any *moderate* measure which would release them from their obligations without entailing any fundamental change in the conditions of political power. It follows, therefore, that any bill which commends itself to the approbation of the House must be *moderate;* that is, must leave things as they are. Under these circumstances, the dilemma of the Government was obvious. If they proposed a bill which meant nothing, they alienated the advanced Liberals; if they introduced a bill which really transferred power from one class to another, they risked the danger of a fatal secession from the ministerial ranks. If at last they have made up their minds, it is due to a clever though unscrupulous piece of tactics on the part of the *Times*. The "leading journal" is bitterly opposed at heart to any idea of reform. It never loses an occasion of giving a back-handed blow at the advocates of an extension of the suffrage; and it has also some not very intelligible personal grievance against the Russell-Gladstone ministry. Rumor says that the cause of offense is the suspension of the favor shown to it in many respects by Lord Palmerston; but its enmity may far more plausibly be attributed to its intense dislike of democracy in any shape than to any personal feeling. The *Times* accordingly, on February 28th, aston-

ished the public by an announcement that, in consequence of the difficulties attending reform, Earl Russell was about to resign office, and that the Duke of Somerset was about to form a Liberal-Conservative administration. The report was at once indignantly denied, and, apparently, with perfect truth. But, in order to counteract the injury caused by it to the credit of the ministry, the Government were compelled to come to some immediate resolution about reform. So on the following night Mr. Gladstone announced that on the 12th of March he would introduce a bill for the alteration of the franchise. Thus the *Times* succeeded in its real object, and has pinned the Government down to a course of action which, in the opinion of that journal, will lead to the downfall of the ministry. It is in fact extremely doubtful whether any important increase will be made to the electoral body in the present temper of the public. But we believe this, even if it prove an abortive, attempt to admit the working classes to electoral rights is only the first step in a movement which will ultimately lead to a social revolution far more important than that introduced by the reform bill of 1832. It is from this point of view alone that the coming discussion can have any general interest for a non-English public.

MR. WORSLEY'S NIGHTMARE.

[He having dedicated his translation of the "Iliad" to General R. E. Lee, late of the U. S. A., later of the C. S. A., "as the best living representative of its hero."]

Worsley.—(*Fallen into an uneasy after-dinner sleep.*)

Bless my soul! here 's a singular dream!
Can it be I am dead and do n't know it?
That has happened ere now to a poet
Who thereafter wrote many a ream;
Is it certain to enter one's head,
When he *is* dead, to think that he 's dead?
Here I am, or at any rate seem,
On the edge of a queer-looking stream
That would do very well for the Styx,
Or that one whom a nightmare fear eggeth on
Might imagine Cocytus or Phlegethon—
If it were, well, that would be a fix!
But perhaps an Homeric translator,
When he wakes up and sees that he 's dead,
Would not feel any difference greater
Than the no-change that happened with lead
In the humbug they called transmutation:—
Is it death I 've gone through or translation?
Or might all not result from the immersion
Of my wits for so long in my version?
If I 'm dreaming, I 'm mixing my classical attainments in maddest confusion;
'T is like pouring in Chian with Massic;
Aristophanes jumbles with Lucian,
I can scarce tell my Greek from my Latin;
Only nonsense of all sorts comes pat in,
And the whole makes a mess of my own ideas
Worse than I did of poor old Maionides.

(*He hears himself snore, and forthwith there enters his conception a*)

Chorus of Frogs.

Brekekex! Brekekex!

Worsley.

Heavens! what 's that?
Perhaps I had best be conning a prayer
To the maker's name inside my hat,
As we Britons are wont in despair
At services long and parsons flat.

Frogs.

Brekekex! Brekekex! who goes there?

Worsley.

Please your Frogships, Homer's last translator:
I 've done it in metre that 's called Spenserian,

Frogs.

Which, used by a bore 's a precious dreary one.
Onk! Onk! we wish you *might* be the last!
He 's as like himself, when so recast,
As one of us to Jupiter Stator:
Why, because one can croak, d 'ye think it follows
That one should set himself up to practise
A cavatina of Phœbus Apollo's,
With voice as rough as a nutmeg-grater?

Worsley.

Ahem! well, my friends, you see the fact is,
We English are always taught to seek
For that inspiration in the Greek,
Which, when your literature was great, your
Authors could somehow find in nature:
Our whole scheme of training takes such pains
To make merest Attics of our brains,
That after all of our plague and fuss
Pure nature 's all heathen Greek to us.

Frogs.

Brekekex! Attic, eh? say Bœotian:
Scarce a grain of *that* salt in your ocean!
Some Greeks, friend, believed in transmigrations,
And get 'em, by Jove, in your translations!

Worsley.

A theory downright Jacobinical!
Can it be that my brain, as it often is,
Is but brimful of old Aristophanes,
And, infect with his humor so cynical,
Is colored by what it doth brood on?
Why, I 'm thinking as wildly as Proudhon!

Frogs.

Brekekex! Coäx! do n't fear a bit!
'T is n't infectious; *he* was a wit.
Brekekex! Coäx! This world is a hoäx,
Version poor of an excellent hit!

Worsley.

Nay, this is profane: I 'll hear no more on 't;
If a trick of my brain, I 'll shut the door on 't.

(*Enter Bacchus, pretending tipsiness, in Charon's boat.*)

Bacchus.

If I were to meet with old Silenus
We could n' tell which was which between us;
Cocktails and juleps! smashes and slings!
I 've got so somehow with those Yankees
(They 've such a talent at mixing things),
I can 't make out where the gangway plank is;
It wavers and rises and falls and swings
Like one of my choruses dithyrambic,
Where you can 't tell trochaic from iambic. (*He lands.*)
Well, the confounded rope-dance is past,
And here I am on the shore at last,
Safe escaped out of Erebus's low air,
With a kind of peristaltic motion,
A devious looseness in my knees,
A general tendency to nowhere,
That gives to firm earth the flux of ocean:
In such a case a gargle of—Bourbon,
I think they call it—will help to curb one: (*Drinking.*)
Good ferrers to le' me have a bottle,
For I am as dry as Aristotle!
Hallo! what 's *your* name?

Worsley.

My name is Worsley; (*Solemnly.*)
Translator, sir, of the last new Homer.

Bacchus.

And, by this bottle, 't is no misnomer!
You could n' ha' made the statemen' terselier,

For nobody 'll ever translate him worselier ;
He 's one o' those skinkers, as I divine, (*Aside.*)
That mixes water with rare old wine ;
And, thus baptizing it by immersion,
Christens the puling result a version.
I say, my friend, do you chance to know
What *we* tempered our wine with, ages ago ?
Put some *salt* in the water, and that
Saved the new product from tasting flat :
You 're surprised ? Well, sure as my name's Lyæus,
You 'll find it so stated in Athenæus.

WORSLEY.—(*Aside.*)

Ah, this comes of taking too much claret ;
If 't was n't a dream I could n't bear it.

BACCHUS.

Well, Misser Worsley,
I warn you firs'ly
(Solemnly, too ; you think I am merry),
As you seem meaning to cross the ferry,
Where Charon does *his* job of translation
In the true, legitimate, stolid way,
So many verses (or trips) every day,
Without depression, without elation,
And no more change in his rhythm of oars
Than in that contractor's measure of yours,
That metes its phrase like a soldier's ration,—
I say, Misser Worsley,
I warn you firs'ly,
That Hector is waiting you, mad as thunder,
As those Yankees say, at your dedication ;
On the other side he 's taken station,
Vowing he 'll tear your ghost's limbs asunder,
Full of black bile as a theologian,
Cursing and swearing,
Ripping and tearing,
In the strongest phrase of ancient Trojan,
And I guess you 'd berrer stan' from under ! (*Exit Bacchus.*)

FROGS.

Brekekex ! Brekekex ! look out, Worsley ;
Heroes are apt to behave perversely ;
If you meet Homer, we warn you, too,
Keep clear of *him*, whatever you do !

WORSLEY.

I 'm in for 't now, and have got to go,
Though the outlook 's rather squally or so :
Here you, honest fellow, what 's your fee ? (*Hailing Charon.*)

CHARON.

An obolus, mostly ; but then, you see,
Sometimes there 's special deductions made ;
For when a man 's been nothing on earth,
Nothing 's as much as the job is worth ;
It 's *gratis* always for those in the trade,
And I understood, from Bacchus there,
Your business has been in the upper air
What my own down here is, more or less,—
Piloting folks to forgetfulness.
But what 's that bundle under your arm ?

WORSLEY.

Why, nothing that *could* do any harm ;
A few poor ghosts of my new translation ;
I did up some half a dozen copies,
To have a few just for presentation.

CHARON.

Lethe once tasted, ghosts need no poppies :
Leave 'em behind you there on the levee,
And nobody 'll touch 'em, I 'll be bound :
What good in dying, if all the bevy
Of life's poor failures, and duns, and bores,
Could follow, to haunt us underground ?
For a boat like mine, such verse as yours,
Though disembodied, were quite too heavy.
Come ! in with you ! I 've no time to wait ;
I 've three more trips yet, and it 's getting late.
You 're English, eh ? (*Talking as he rows.*)

WORSLEY.

Yes.

CHARON.

So I could swear !
You 've most of you such a stuck-up air,
And somehow look down on all creation
As if you were each the British nation ;
Doer of everything under the sun,
From taking Troy to the last bad pun.
Once get your white chokers under your chins,
What conscience you *do* have for other folks' sins !

WORSLEY.—(*Aside.*)

A most uncommonly vulgar hind !
We *have* done everything, time out of mind,
And so little boastful, modest elves,
That nobody knows it but ourselves.
If we should brag like the Yankees and French—

CHARON.

Come, be packing ! Art grown to the bench ?
Why, John Bull thinks e'en the lower regions
Must pay his comfort proper allegiance !

(*Enter Hector and to him a crowd of American ghosts just landed.*)

SPIRIT OF SMITH.—(*Spits and speaks.*)

General Hector, 't would make us proud,
If my friends and I might be allowed
To take so great a man by the hand,
And we 'd be grateful, if you 'n' your staff,
Would favor us each with an autograph :
My name is Smith, sir. I 'll take my stand
And introduce 'em all as they land,
Gentlemen sperrits, you 'll step this way
And shake the general's hand, I say.

HECTOR.—(*After the presentation of three thousand.*)

By Jove ! I feel like an old town-pump ;
I never was in such a scrape as this ! (*Aside.*)
Allow me, good sirs, to have the bliss
Of greeting the others in a lump ;
And as for autographs, to my shame,
I never e'en learned to write my name ;
I lived in the ages, you know, called dark,
When men had a way of making their mark.

SPIRIT OF SMITH.—(*Spits and speaks.*)

Well, I hope you won't decide adversely
On one request I shall put to your vote—
That 's to present my friend, Mister Worsley,
I made his acquaintance on the boat :
I rather guess it 's likely you know him—
Author of "Homer," a first-class poem.

WORSLEY.—(*Aside.*)

Confound his impudence ! But for him,
I might have slipt by : my chance is slim.
Acquaintance, indeed ! I 'd like to know
If he makes 'em by treading on one's toe ?
For no more, no less, that I could see,
Was all of his introduction to me !

HECTOR.

Ah, here, then, I have you ; come at last !
My staff has been longing, these three months' past,
To measure the back of that dedicator
Who likened me to the double traitor,
False to his country, false to his oath,
Me, who 'd have given my life for both !

Me, who no omens could understand
But those that said, Fight for Fatherland!
Achilles dragged but my dust in dust;
You insult my soul without reason,
Coupling my name with a broken trust,
Dabbling my fame in the lees of treason.

WORSLEY.—(*Aside.*)

That swelling nostril I hardly like,
Nor the look that makes me too mean to strike:
I never felt worselier since I was born,
Between my fears of his staff and scorn.

HECTOR.

Did he war bravely? The more his shame;
And, once men take their side with wrong,
Their guilt stalks behind them, stern and strong,
And despair may win fair valor's name.
Courage is mostly a thing in the veins;
'Tis Valor that lives in the poet's strains,
Valor that stands for the right and true,
A thing unconceived by such as you!
Was *his*, then, your notion of the bravery
That swells in deathless echoes of song?
Forth from my presence, poor snob of slavery,
Herd with the dull souls where you belong!
Study that bible you call the Peerage,
Get what salvation therefrom you can,
Nor come near me, lest I pay the arrearage
Due to your ribs from an honest man.

(*Mr. Worsley awakes in terror, but gradually composes himself by reading a few pages of his translation of Homer.*)

J. R. L.

THE THEATRES.

WHY is the theatre the insignificant institution that it is among us? We take for granted that it is insignificant, and can enter into no argument on that point. There is no one to argue that question with but the actors, and they are the last persons with whom one would think of arguing any question of social importance. The great writers, the Massingers, Fords, Otways, Ben Jonsons, Sheridans, the Racines, Corneilles, Molières, no longer write for the stage, because its productions hold no place in literature. The great critics do not think it worth while to exercise their acumen on its performances. The magazines allow no space to its interests. Even the daily press hardly notices its representations, or notices them under the name of "amusements." The educated men and women, people of culture and refinement, never frequent the theatres, and are rarely seen there. The audiences are made up chiefly of strangers in the city and of that class of people who find the opera an entertainment either too expensive or too refined for their taste. After all that Booth has lately done for it among us, the theatre has no place in the regards of the literary, the elegant, or the fashionable.

There must be good reasons for this, and in our judgment they are not far to seek. The theatre is not so much respected in our generation as it was in the last because it has not the place in our generation that it had in the last. It is not marked by the characteristics of the age or in communication with the spirit of the age, where that spirit is peculiar. If anything distinguishes the epoch we live in, it is a decided tendency towards realism, or, as some call it, naturalism—a disposition to be severely true to nature. This character is stamped on all the genuine products of the time. The artist paints nature; the poet draws his inspiration and takes his theme from the sentiments of ordinary existence, and tries to set common humanity to music; prose composition in every kind is direct and simple; the best literary style is the most unaffected style. Even the pulpit, which is usually the most stubborn in its resistance to the new genius, whatever it may be, feels the tone of this tendency and yields to it. The preacher studies to lay aside the sententious declamatory style of the fathers, uses his natural voice in a natural way, talks right on, and in all he says seems to mean business. It is conceded that the conversational manner is the best for him. In the lecture-room, on the platform, mouthing and gesticulation no longer pass current with the most appreciative assemblies. The stage alone betrays an unconsciousness of the change that has come over the tastes of the people. The theatres are smaller, as if intended for the exhibition of the quiet social life of our age instead of the grand heroic life which the drama of the last century loved to display; the stage itself is narrower, as if for lowered voices and more familiar action among the players, but otherwise the new order of things is not recognized. The actors hitch and strut after the old manner; mouth and drawl and rant, do everything with their voices but use them as gentlemen and ladies do; make horrible grimaces and saw the air with their hands in a most unnatural manner; they neither enter a room, nor leave it, nor walk across it; they neither sit nor stand, neither salute nor converse, as ordinary men and women do those things. The stage appointments are bad. There is no skill in arranging parlors to look like the rooms people live in. The plays are poor, not born of the social experiences nor representing the manners of the time. If they have merit, they were written by the authors of the last generation, and cannot be acted naturally; if they can be acted naturally they have no merit, because they present unattractive or low phases of social life. Few of the good plays are modern—little of the acting, therefore, is modern. But it will not do for the playwright to live in one century and the play-actor in another. The French understand this, and they have a theatre genuine in its kind, legitimate, fascinating as theatre ever was, probably more so, and yet entirely within the compass of modern experience. The play represents a bit of real life, and the players show their talent by the perfect skill with which they mimic real life. The French theatre is a most charming entertainment for cultivated people, and cultivated people frequent it. Even here in New York, where the French stage falls far below the best Parisian standard, it attracts a crowd of ladies and gentlemen who are never seen within the walls of any other play-house in the city, and who seldom regret the hour or two they spend there, because the play and the players come within easy reach of their sympathies. Actors and spectators recognize each other as belonging to the same humanity, living in the same epoch, and sharing the same experiences, and that is more than can be said of any other theatre in the city, not even excepting the Winter Garden in its best estate.

Here we are persuaded is the secret of the failure, and failure here involves failure elsewhere, every kind of failure. For to make amends for this radical defect, which they will not or cannot cure, the managers of theatres appeal to the love of amusement in its cheapest, gaudiest form, and try to catch the interest of the people without engaging their minds. The eye is dazzled by tawdry spectacles. Every kind of fancy is brought in to make the show novel. Comedy, burlesque, extravaganza, absurdity, caricature, dumb-show burlesque, and picturesque are overworked. Ideas are excluded or so covered up with affectations and drolleries that the people shall not be reminded of real life or aught thereto pertaining. Their risibles, not their intellects, are addressed. We are not taking any high position or claiming any elevated mission for the stage, as if it should undertake to instruct or edify the public. We are willing to concede that its great function is to amuse. This has always been its function in modern society. Whatever it may have been in the classic ages, the theatre in the last century or centuries, in the time of Ben Jonson and Shakespeare even, looked toward this end, it is probable, and toward no other. People went to the play-house for entertainment, and they found it in the romantic drama with its heroic personages, its sententious moralities, and its high-flown declamations. Such a drama would not amuse us much; it would more likely bore us past endurance. But is it necessary that, in order to amuse us, the theatre should treat us as if we were children, who could be entertained with nothing but the gaudiest spectacle or the broadest farce? Is there no amusement without fanciful tricks or side-shaking laughter? Is the comical, the grotesque, or the impossible a necessary element in entertainment? Grant that the uneducated part of the people desire this and will welcome nothing better, is the theatre designed for the uneducated part of the people only, and is it satisfied when it can reach them at their lowest point of unrefinement and can give them just what they desire and no more? Surely others than the vulgar wish to be amused and need to be, and they are easily satisfied too; it is only necessary to mingle talent, wit, sprightliness, intelligent observation, delicate criticism, and some perception of character with their entertainment, and they will be entertained. But they do demand this. To say that the stage is what the people make it, and that it must be content to follow the popular taste, instead of leading it, is to say what we are not anxious to dispute. Our complaint is that it does not accomplish as much as this. It simply follows the most vitiated taste, and does that badly. There is a demand for the stage among cultivated people, as the French theatre proves. Why not meet this demand? Why not "pander" to this taste? Why not have plays that will interest the better portion of the middle, even of the working classes, and playing that will have sufficient vitality and grace to charm them? There is no reason why not, except that theatrical managers choose to make money in the easiest way, and if they can fill their houses with decently-behaved audiences, give little care or thought to the perfec-

tion of their art or the extension of their influence among the better class.

We should like to say something of the moral influence of the theatre, but it is hard to say what we feel like saying now; it is hard to say anything on the subject wisely, usefully, and well. The theatre, perhaps, can never be expected to do more than reflect the moral sentiment, and catch the moral tone, of the society it belongs to. It is not its business to preach; it is not a censor or a judge. Its duty, let it be conceded, is merely to hold the mirror up to nature. But then its mirror should not be cracked, or clouded with film, or covered with dust. And it should be held up so as to reflect "good" nature, as the artists call it. It should show the actual morals of real life, be they what they may be. Several generations ago, when the customs and manners of social life were artificial in the extreme; when it was the fashion in ordinary conversation, in private intercourse, and even in familiar letter-writing between friends and relatives, to use a stilted phraseology; when ladies and gentlemen, in parlors, indulged in high-flown sentimentalities about virtue; when preachers and public orators generally dealt in flowery paragraphs, and choice moralities were current from lip to lip, the playwrights very properly mimicked the habit, and the players deemed it part of their vocation, as of course it was, to roll out the swelling periods with unction, and give to virtue its meed of exalted praise. We never do this now in ordinary life; the man who does it is voted a Pharisee or a prig. Even ministers feel the unreality of it. Why should the stage alone keep up the out-worn tradition? Or why should the stage, sensible that the tradition is out-worn, and conscious that the high vaulting moralities fall flat, go straightway to the other extreme, and let it be understood that honest, sincere, genuine virtue is a thing not to be found or looked for in ordinary life or among real people? Why, from chastising vice with long, involved periods, have they taken up the task not of soberly chastising but of ridiculing and caricaturing human nature itself? Why, under the guise of correcting bad morals, do they somehow succeed in shocking good ones? Why, instead of making men and women ashamed of being hypocrites, liars, plotters, knaves, buffoons, do they make them ashamed of being men and women? The old way of scourging vice on the stage proceeded on the assumption not only that vice was a thing to be scourged, but that virtue was powerful enough to scourge it, and that men and women were virtuous enough to bear the scourging and be thankful. The new way of scourging vice on the stage seems to proceed on the assumption that all are vicious; that, if the truth were told, none are virtuous, and the glee occasioned by the whipping is simply the glee which one set of rogues takes from seeing another set of rogues get their deserts. The stage portrays the vices and the virtues of the most vicious and the least virtuous classes in society. It would escape from such a falsification of truth if it would undertake to represent comprehensively human life in all its phases as it goes on about us, at home and abroad. People are no less virtuous now than they have been formerly; on the contrary, we believe they are much more so, and nothing more would be required to elevate the moral character of the stage than a faithful delineation of the actual character of refined social existence.

A critic in the first February number of the "Revue des Deux Mondes," of the current year, writing on the morals of the stage, says: "Let any one, on coming away from one of our popular theatres, examine himself, and he will confess that he has been wounded in the very heart and stung undefinably in the noblest part of him. He has been amused; he has been at moments even touched; this scene has been charming, that was animated with a fine spirit, yet another was full of just perceptions and witty sayings. But he is dissatisfied, and he feels that he has a right to be." Few persons on leaving one of our theatres could honestly say that they had been charmed or touched or impressed by passages of truth or wit. They might say they had been amused; they would, probably, if they were candid; they would, certainly, if they were earnest, say they had been wounded and shocked. The writer in question justifies his verdict by an analysis and criticism of several of the most popular dramas, and comes to the conclusion that a low idea of human nature can alone explain the debasement he deplores. For this low idea of human nature he does not hold the age responsible so much as the laws and institutions under which the French people live. The stage may not be unjust to society, but society has no chance to do justice to itself. The case does not stand so with us. Here society has full opportunity to do justice to itself, but it receives no justice at the hands of playwrights and play-actors. No one could guess from our theatres what our world was like; and the world does quite right in letting them severely alone. Our dramas are not even American in the most distant sense. With one or two exceptions, they are English and English adaptations from the French. They portray, therefore, English life and French life, as it was their duty and purpose to do. Whether they do that well or ill is a matter that concerns English and French critics more than it does us. English and French life are very different in almost all respects from American life. All the forms of society are different. Institutions and customs, morals and manners, dress and carriage, are wholly unlike. The transplanting of the theatre is as illegitimate as the transplanting of the journal, the bar, or the platform. The French stage pleases not because it is French, but because it is finished in art. An American stage equally excellent would please so much the more. The theatre will not be real till it is grown on our soil. When it is born of American life, it will represent American society, and cultivated people will be its hearty patrons.

A HALF-HOUR AT HERCULANEUM.

I.

THE road from Naples to Herculaneum is, in fact, one long street; it hardly ceases to be city in Naples till it is town at Portici, and in the interval it is suburb, running between palatial lines of villas, which all have their names ambitiously painted over their doors. Great part of the distance this street is bordered by the bay, and, as far as this is the case, it is picturesque, as everything is belonging to marine life in Italy. Everywhere seafaring people go lounging up and down among the fishermen's boats drawn up on the shore, and the fishermen's wives making nets, and the fishermen's children playing and clambering over both, while over all flap and flutter the clothes hung on poles to dry. In this part of the street there are, of course, oysters, and grapes, and oranges, and cactus-pulps, and cutlery, and iced drinks to sell at various booths; and commerce is exceedingly dramatic and boisterous over the bargains she offers there; and equally, of course, murderous drinking shops lurk at intervals along the pavement, and lure into their recesses mariners of foreign birth, briefly ashore from their ships. The New York Coffee House is there to attract my maritime fellow-countrymen, and I know that if I look into that place of refreshment I shall see their honest, foolish faces flushed with drink, and the excitement of buying the least they can for the most money. Poor souls! they shall drink that pleasant morning away in the society of Antonino the best of Neapolitans, and at midnight, emptied of every soldo, shall arise, wrung with a fearful suspicion of treachery, and wander away under Antonino's guidance to seek the protection of the consul; or, taking the law into their own hands, shall proceed to clean out, *more Americano*, the New York Coffee House, where Antonino shall develop into one of the landlords, and deal them the most artistic stab in Naples: handsome, worthy Antonino, tender-eyed, subtle, pitiless!

II.

Where the road to Herculaneum leaves the bay and its seafaring life, it enters, between the walls of lofty, fly-blown houses, a world of maccaroni haunted by foul odors, beggars, poultry, and insects. There were few people to be seen on the street, but through the open doors of the lofty fly-blown houses we saw floury legions at work making maccaroni; grinding maccaroni, rolling it, cutting it, hanging it in mighty skeins to dry, and gathering it when dried, and putting it away. By the frequency of the wine-shops we judged that the legions were a thirsty host, and by the number of the barber-surgeons' shops that they were a plethoric and too full-blooded host. I think the latter were in the proportion of one to five of the former; and the artist who had painted their signs had indulged his fancy in wild excesses of phlebotomy. We had found that, as we came south from Venice, science grew more and more sanguinary in Italy, and more and more disposed to let blood. At Ferrara, even, the propensity began to be manifest on the barbers' signs, which displayed the device of an arm lanced at the elbow, and jetting the blood by a neatly described parabola into a tumbler. Further south the same arm was seen to bleed at the wrist also; and at Naples an exhaustive treatment of the subject appeared, the favorite study of the artist being to represent a nude figure reclining in a genteel attitude on a bank of pleasant green sward, and bleeding from his elbows, wrists, hands, ankles, and feet.

Phlebotomy and the manufacture of maccaroni may be distinct branches of industry at Naples, and I do not deny that they are; but I have never in my own mind been able to dissociate them since the day of my ride to Herculaneum.

III.

In Naples everywhere one is surprised by the great number of English names which appear on business-houses, but it was entirely bewildering to read a bill affixed to the gate of one of the villas on this road: "This Desirable Property for Sale." I should scarcely have cared to buy that desirable property, though the neighborhood seemed to be a favorite summer

resort, and there were villas, as I said, nearly the whole way to Portici. Those villas which stood with their gardens towards the bay would have been tolerable, no doubt, if they could have kept their windows shut to the vile street before their doors; but the houses opposite could have had no escape from its stench and noisomeness. It was absolutely the filthiest street I have seen anywhere outside of New York, excepting only that little street which, in Herculaneum, leads from the theatre to the house of Argo. This pleasant avenue has a stream of turbid water in its centre, bordered by begging children, and is either fouler or cleaner for the water, but I shall never know which. It is at a depth of some fifty or sixty feet below the elevation on which the present city of Portici is built, and is part of the excavation made long ago to reach the plain on which Herculaneum stands, buried under its half-score of successive layers of lava, and ashes, and Portici. We had the aid of all the virtuous poverty and leisure of the modern town—there was a vast deal of both, we found—in our search for the staircase by which you descend to the classic plain, and we found it a discovery involving the outlay of all the copper coin about us, while the sight of the famous theatre of Herculaneum was much more expensive than it would have been had we come there in the old time to see a play of Plautus or Terence. As for the theatre, "the large and highly ornamented theatre" of which I read, only a little while ago, in an encyclopædia, we found it, by the light of our candles, a series of gloomy hollows, of the general complexion of coal-bins and potato-cellars. It was never perfectly dug out of the lava, and it is known how it was filled up, together with other excavations, when they once threatened to endanger the foundations of worthless Portici overhead. I am amused to find myself so hot upon the poor property-holders of Portici. I suppose I should not myself, even for the cause of antiquity and the knowledge of classic civilization, like to have my house tumbled about my ears. But though it was impossible in the theatre of Herculaneum to gain any idea of its size or richness, I remembered then the magnificent bronzes which had been found in it, and did a hasty reverence to the place. Indeed, it is amazing, when one sees how small a part of Herculaneum has been uncovered, to consider the number of fine works of art in the Museo Borbonico which were taken thence, and which argue a much richer and more refined community than that of Pompeii. A third of the latter city has now been restored to the light of day; but though it has yielded abundance of all the things that illustrate the domestic and public life, and the luxury and depravity of those old times, and has given the once-secret rooms of the museum their worst attraction, it still falls far below Herculaneum in the value of its contributions to the treasures of classic art, except only in the variety and beauty of its exquisite frescoes. The effect of this fact is to stimulate the imagination of the visitor to that degree that nothing short of the instant destruction of Portici and the excavation of all Herculaneum will satisfy him. If the opening of one theatre, and the uncovering of a basilica and two or three houses, have given such richness to us, what delight and knowledge would not the removal of these obdurate hills of ashes and lava bestow!

Emerging from the coal-bins and potato-cellars, the visitor extinguishes his candle with a pathetic sigh, profusely rewards the custodian (whom he connects in some mysterious way with the ancient population of the injured city about him), and, thoughtfully removing the tallow from his fingers, follows the course of the vile stream already sung, and soon arrives at the gate opening into the exhumed quarter of Herculaneum. And there he finds a custodian who enters perfectly into his feelings; a custodian who has once been a guide in Pompeii, but now despises that wretched town, and would not be guide there for any money, since he has known the superior life of Herculaneum; who, in fine, feels towards Pompeii as a Bostonian feels towards New York. Yet the reader would be wrong to form the idea that there is bitterness in the disdain of this custodian. On the contrary, he is one of the best-natured men in the world. He is a mighty mass of pingueous bronze, with a fat lisp, and a broad, sun-flower smile, and he lectures us with a vast and genial breadth of manner on the ruins, contradicting all our guesses at things with a sweet "Perdoni, signori! ma ——." At the end, we find that he has some medallions of lava to sell: there is Victor Emanuel, or, if we are of the *partito d'azione*, there is Garibaldi; both warm yet from the crater of Vesuvius, and of the same material which destroyed Herculaneum. We decline to buy, and the custodian makes the national shrug and grimace (signifying that we are masters of the situation, and he washes his hands of the consequences of our folly) on the largest scale that we have ever seen; his mighty hands are rigidly thrust forth, his great lip protruded, his enormous head thrown back to bring his face on a level with his chin. The effect is tremendous, but we, nevertheless, feel that he loves us the same.

IV.

The afternoon on which we visited Herculaneum was in melancholy contrast to the day we spent in Pompeii. The lingering summer had at last saddened into something like autumnal gloom, and that blue, blue sky of Naples was overcast. So, this second draught of the spirit of the past had not only something of the insipidity of custom, but brought rather a depression than a lightness to our hearts. There was so little of Herculaneum: only a few hundred yards square are exhumed, and we counted the houses easily on the fingers of one hand, leaving the thumb to stand for the few rods of street that, with its flagging of lava and narrow border of footwalks, lay between; and though the custodian, apparently moved at our dejection, said that the excavation was to be resumed the very next week, the assurance did little to restore our cheerfulness. Indeed, I fancy that these old cities must needs be seen in the sunshine by those who would feel what gay lives they had once led; by dimmer light they are very sullen spectres, and their doom still seems to brood upon them. I know that even Pompeii could not have been joyous that sunless afternoon, for what there was to see of mournful Herculaneum was as brilliant with colors as anything in the former city. Nay, I believe that the tints of the frescoes and painted columns were even brighter, and the walls of the houses were far less ruinous than those of Pompeii. But no house was wholly freed from lava, and the little street ran at the rear of the buildings which were supposed to front on some grander avenue not yet exhumed. It led down, as the custodian pretended, to a wharf, and he showed an iron ring in the wall of the house of Argo, standing at the end of the street, to which, he said, his former fellow-citizens used to fasten their boats, though it was all dry enough there now.

There is evidence in Herculaneum of much more ambitious domestic architecture than seems to have been known in Pompeii. The ground-plan of the houses in the two cities is alike; but in the former there was often a second story, as was proven by the charred ends of beams still protruding from the walls, while in the latter there is only one house which is thought to have aspired to a second floor. The house of Argo is also much larger than any in Pompeii, and its appointments were much more magnificent. Indeed, we imagined that in this more purely Greek town we felt an atmosphere of better taste in everything than prevailed in the fashionable Roman watering-place, though this, too, was a summer resort of the "best society of the empire." The mosaic pavements were exquisite, and the little bedchambers dainty and delicious in their decorations. The lavish delight in color found expression in the vividest reds upon the walls, and not only were the columns of the garden painted, but the foliage of the capitals was tinted of various hues. The garden of Argo's house was vaster than any of the classic world which we had yet seen, and was superb with a long colonnade of unbroken columns. Between these and the walls of the houses was a pretty pathway of mosaic, and in the midst once stood marble tables, under which the workmen exhuming the city found certain crouching skeletons. At one end was the dining-room, of course, and painted on the wall was a lady with a parasol. I thought all Herculaneum sad enough, but the profusion of flowers growing wild in this garden gave it a yet more tender and pathetic charm. Here—where so long ago the flowers had bloomed, and perished in the terrible blossoming of the mountain that sent up its fires in the awful similitude of nature's harmless and lovely forms, and showered its destroying petals all abroad—was it not tragic to find again the soft tints, the graceful shapes, the sweet perfumes of the earth's immortal life? And of them that planted and tended and plucked and bore in their bosoms and twined in their hair these fragile children of the summer, what witness in the world? Only the crouching skeletons under the tables. Alas and alas! Master Poet, lend us your rhymes and your handkerchief.

V.

The skeletons went with us throughout Herculaneum, and descended into the cell, all green with damp, under the basilica, and lay down, fettered and manacled, beside the big bronze kettle there in which the prisoners used to cook their dinners. How ghastly the jolly thought of it was? If we had really seen this kettle and the skeletons there—as we did not—we could not have suffered more. They took all the life out of the house of Perseus, and the beauty from his pretty little domestic temple to the Penates, and this was all there was left in Herculaneum to see.

"Is there nothing else?" we demand of the custodian.

"Signori, this is all."

"It is mighty little."

"Perdoni, signori—ma!"

"Well," we say sourly to each other, glancing round at the walls of the pit, on the bottom of which the bit of city stands, "it is a good thing to know that Herculaneum amounts to nothing."

THE SOUTH AS IT IS.

FROM OUR SPECIAL CORRESPONDENT.

XXXIV.

VICKSBURG, Miss., March 8, 1866.

I SET out from Baton Rouge for Vicksburg and the North on the steamboat *Columbian*. At the place where I went aboard, as at most other points, she followed the fashion of Mississippi steamboats, and made the landing with more haste than ceremony. It was pleasant to look on one Southern scene full of business-like activity and bustle—the bow scraped the bank, gangway planks were instantly pushed out, freight was rolled ashore in a hurry, people crowded aboard, jostling each other to beg a late newspaper from the clerk; the steam, all the time roaring and hissing, made the boat itself seem impatient to be off, and at the end of five minutes we were making for the middle stream.

The few passengers were mostly Northerners bound for St. Louis. One reads of the strange characters, of the gambling and hard drinking on these river boats, and I looked for something of the kind, but saw nothing of it; everything was orderly and commonplace. We were going up "against a rise," I was told, so that the water was thicker than usual with mud, and great quantities of driftwood were carried past us on the strong current, but our rate of speed was nearly eight miles an hour. Let the traveller forget that not unlikely he may be scalded to death or blown to pieces, and a voyage up the river is pleasant travelling, if only because one is constantly astonished at the grandeur and immensity of the stream, recognizes the river as a wonder of nature, and because, as he sails for days after days on into the heart of a continent, he is forced to see the vastness of the country and to think of its wealth and strength in the future.

I became acquainted with but one of my fellow-passengers. He was a man from Maine, and was then on his way home again from Texas, whither he had gone at the end of the war. He had been a photographer, he said, in Austin, and away down there that was a very profitable occupation; pictures commanded big prices. He 'd have liked to stay there if the people had been a little more reasonable; but they were so down on Yankees that he was a little afraid to risk it, and, as he had been offered a good price for his gallery, he decided to sell out and get away. The soldiers were there now, but nobody knew how long they 'd remain; as soon as they should go, all the Yankees that did n't want to turn rebels would have to go too. A regular Yankee soon finds out how he 's looked down on, and he do' n't trust them. He himself had learned to carry a pistol all the time; everybody had to do it, and a Yankee in particular ought to go armed. Here was an example of the way in which they felt: One day he was in his back room, finishing a picture, and a couple of ladies walked into the reception room and began to examine the specimens. It so happened that he had photographed a good many of the officers, and he heard one lady say, "Why it 's a regular Yankee concern. 'Most every picture is some beast of a Yank." That was a kind of talk that always made him mad; he 'd heard about enough of it, so he stepped out and said, "Madam, if those officers are Yankees, they are all gentlemen." The women walked off disgusted, and would n't have anything done. It was that style of thing that disgusted him with the Southerners. At one time they were decent, comparatively. "We 're whipped," you 'd hear 'em say—"fightin' 's played." But after the women folks got hold of them the men gave up all that, and now men and women were about alike—more disloyal than they were in '60. The niggers were going to have a good time.

This person's view of these matters was the same with that of an intelligent Northerner, whom I met in Baton Rouge. He had been travelling from Ohio to Louisiana, to seek for the remains of some unfortunate friends of his who had perished miserably in a steamboat explosion, and whose bodies, it was possible, might be found at some point between Vicksburg and the Gulf. His search had brought him into contact with all sorts of persons in several States, and he had endeavored to find out as much as possible about the opinions and feelings of the Southern people. I asked him to let me know his conclusions.

"You must understand," said he, "that in 1860 I was a strong Douglas man. I did n't like Lincoln, and the abolitionists I hated; but, of course, I was Union. As the war went on I began to believe in Lincoln, and, by the time the Emancipation Proclamation was issued, I had been educated up to it and endorsed it. As a war measure, I mean; that was how Mr. Lincoln regarded it, and so did I. Well, since the war ended I 've been a conservative; I 've considered Stevens and Sumner dangerous men, who did n't understand the South, wanted to humble it and so on, and were standing in the way of peace. I believed what we used to hear, that the North did n't understand the South. I believe it yet, but in a very different sense. This journey has been the greatest that I ever experienced. I came out with the kindest feelings for these people down here; I wanted to see it made easy; we had whipped them, and I wanted it to rest there. I thought the South wanted it to end there. But I was tremendously mistaken. They hate us and despise us and all belonging to us. They call us cut-throats, liars, thieves, vandals, cowards, and the very scum of the earth. They actually believe it. They won't even allow that we won our own battles. 'We were overpowered by numbers,' they say; 'of course we could n't fight all Europe.' They 've said that to me more than fifty times within the last few weeks. And they say that they are the gentlemen; we are amalgamationists, mudsills, vandals, and so forth. And I 've heard and seen more brag, and lying, and profanity, and cruelty, down here, than I ever saw or heard before in all my life. The only people I find that a Northern man can make a friend of, the only ones that like the Government and believe in it, are the negroes. I 'm convinced they can vote just as intelligently as the poor whites. A Southerner would knock me down if I said that to him; but it 's true. I tell you I 'm going home to be a radical. Fight the devil with fire. I 've learned to hate Southerners as I find them, and they can hate me if they want to. I 'm a Sumner man after I get back, and I shall write out my experience for some of our papers. Every man that 's seen what I 've seen ought to let it be known. 'The North do n't understand the South,' you know, and I 'm going to help our people to see two or three things: that the chivalry hate us and despise us; that a 'nigger' they do n't consider human; that whatever harm they can do us without getting another whipping, they 've got the will to do, and mean to do, too. I wish every county in the North would send out two men, who have the confidence of their fellow-citizens, and make them travel through the South and report the true condition of things. They could n't make a true report without changing every honest administration man into a radical. I know what I was when I came out, but I could n't resist the evidence of my own senses."

It was eight o'clock in the morning when we reached Vicksburg, and it was not till the following morning that we could fully perceive the repulsiveness of the place. On that night, however, the landlord of the principal hotel assisted us to form a correct notion of it. He walked into the hall or office where most of his guests were assembled, and cried out in a loud voice as he walked up and down through the crowd, "Gentlemen, I warn you to take care of your money. Hardly a night passes that some gentleman in the house is not robbed. Let me beg you to look out for your money." Upon this my next neighbor said to me, "These d—d niggers, you see"—a reference to the waiters. But in fact the rooms contained two or three beds, and no one knew whether his room-mate was not a Vicksburg gambler or one of the people who make the city streets unsafe after nightfall.

On the next morning I walked about the place, observing with curiosity the singular bluff on which the town stands and overlooks many miles of the surrounding lowlands; and saw the semi-circular sweep of the Federal earthworks. In the streets there are still vestiges of the innermost lines of the besieged, and also of the caves or burrows in which people hid themselves from Grant's shot and shell. Not much, I suppose, has been done to remove the traces of the siege, and, if so, it is evident that the city suffered little by it.

The day was chilly, and in the afternoon I sat before the red-hot stove in one of the hotels and listened to one of those conversations which so displease most Northern travellers in the South. Perhaps a dozen people sat within hearing of the three speakers. Of the latter two were elderly men of good appearance, and the third was a young man of twenty-five or twenty-six, with a dyed moustache and insolent manners, who chewed tobacco and nursed one of his small feet, while, without modesty or hesitation, he engrossed the principal part in the conversation.

"Well," said one of the old men, "you were luckier than I was. They broke me up. I lost about fourteen thousand dollars worth of niggers, and they 've taken that lot of mine, and I 've got to go to work and make it up."

"They did n't make much out of me," the young man said. "Put a bullet through me at Baton Rouge; but I reckon they owed me that much, some of 'em. I had n't anything to lose. I was raised to work myself since I was that high."

"Ah, you were? At the North?"

"No, *sir*. Never was north of the Potomac till John Morgan went into Ohio, and if I live a hundred years I 'm never going again. Got no use for wooden hams."

"And these yer shoe-peg oats."

"What 's that?" said the other old man.

The young man explained to him: "Why, these Massachusetts and

Connecticut Yankees make shoe-pegs by machinery, and they make 'em cheap, so whenever they can they shove 'em off for oats on some trader at a distance. Put a few sacks of pegs among the piles of oats, you know. You go to New Orleans, and any of the grain-dealers will tell you all about it. Wooden nutmegs, wooden clocks, wooden hams—every d—n thing. I was talking to one of these fellows not long ago, and he beat round and would n't talk out openly. Trying to make me think he was a Southerner. Says I, 'How long have you been out from Boston?' 'Haow long have I been eout from Boston?' says he. 'Yes,' says I; 'I know a Yankee from Massachusetts whenever I see him. You 're no Southern man;' and then he owned he was n't."

"Ha! How did you know him?"

"His talk. And then they 've all got short fingers—picking up pegs, I tell 'em—and think more of half a dime than you would of a dollar. I can 't stand 'em."

"But, by George! though, I do n't see but what we 've got to stand 'em."

"Yes, if you stay here you have. What 's more, you 've got to stand nigger suffrage. You 'll have your niggers voting within a year."

"Oh, no; no, sir. That would n't be constitutional."

"Constitutional! How much constitution have you got left? Look at the nigger soldiers in the streets. You 'll have nigger suffrage in a year. Did n't you see that the niggers in Texas have sent up a petition for it? They have; and they 'll get it. Well, I expect to be in Mexico three months from now."

"You going to that new town some of our folks have got there? But a' n't the United States going to drive Maximilian out?"

"It 's none of the United States's business."

"Oh, but there 's the Monroe doctrine. We 've told Europe that our people a' n't going to have kings and monarchs on our soil, and you 'll see Maximilian 'll have to quit."

"Well, I a' n't in for monarchy myself. But the Mexicans are better than the Yankees and the niggers."

"Well, Johnson 's doing very well now. He do' n't believe much in the niggers, neither, and when we 're admitted into Congress we 're all right. The men that tyrannize over us now won't be in a majority then."

"All the men, North and South, that are conservatives, must unite together. There are some men at the North that behaved very well all through the war, and we must unite with them."

"All right; you gentlemen can try it."

"Well, if we can 't get in we can stay out, anyhow, and we 'll see how they can get along without us."

"If it was n't for these niggers. There 's the difficulty."

"They a' n't going to be in the way long. There a' n't half the niggers that there was. A heap of 'em 's dead. You may know that by it 's being so hard to hire 'em; there actually a' n't the niggers; and now they 're re-taking 'em to Cuba, and selling 'em. Did you see that Toombs met his coachman in the street in Cuba, and found he 'd been sold there?"

"Yes," the other old man said; and Mr. ——, of Hinds County, "had told him that he knew it for a fact that one cargo had gone over certain."

Then the talk went on about the injustice and folly of emancipation; how miserable the lot of the freedman must necessarily be; how cotton and sugar and rice never could be cultivated except by slave labor, and how the United States undoubtedly ought to pay the value of every emancipated slave. The young man for his part told of his battles, and, as I have repeatedly noticed on similar occasions, his audience received quite readily more than one story of cold-blooded cruelty, which, at the North, would not have been listened to by any circle of persons of equal intelligence and apparent respectability, if any one could be found to tell them there. For example, he and half a dozen of his companions being at some little distance from their command, came upon a straggling party of four Federal soldiers. Immediately after capturing the squad they stripped them of their shoes and hats. "We wanted them, you know; and if they had a fine watch or a roll of greenbacks, we wanted them too. Being on foot, they could n't keep up with us, and, of course, we were in a hurry about that time; so when we got into a piece of pine the Yanks did n't come out when we did. Do n't know whether any stray Yanks were seen round there after that. Maybe."

The headquarters of the Freedmen's Bureau for Mississippi is at Vicksburg. It is chiefly busied with a general supervision of the affairs of the colored people, and occupies itself with details only when its interference is necessary. The examination and approval of contracts is not a part of its work, and the relations between employer and employed are controlled, in the first instance at least, by the civil authorities. Through its subordinate officials, its influence is extended to every part of the State, and, as might be expected, it is not a popular institution. Every sub-assistant commissioner the assistant commissioner informs me, needs military force within call to sustain him. The freedmen are working very well, and are receiving good treatment; their labor being in great demand, it commands very good prices, and the planter finds it to his interest to use his laborers well. It is not from the oppressive acts of individuals, therefore, that the negroes suffer most injustice, but from the spirit in which the civil authorities enforce the laws. Under the provisions of the vagrant law, for example, a white man as well as a negro might be arrested; but in practice it is found that while honest and industrious negroes are often arrested and punished, there is no arrest of notoriously idle and worthless white men. For this state of things the spirit of public opinion is responsible; and because this state of things exists the Bureau is a necessity. The hostility to schools for the negroes is very general, and often very bitter and dangerous. In the middle of February a Dr. Lacy, an old man who had started a school in Okolona, was four times shot at as he walked in the street for no other reason than that he was a teacher of negroes.

Such cases, whenever they occur, are reported by the officers of the Bureau to the military commander, General T. J. Woods. The case of Dr. Lacy has been reported. As yet nothing has been done in reference to it. In the town of Fayette the people will not permit schools to be maintained, and in Grenada they will not permit them to be opened.

In the face of such opposition, 5,240 children have been gathered into schools, and are receiving instruction from about 70 teachers, who are paid in small part by their pupils, but mainly by the Northern charitable associations. In the monthly reports returned by these teachers they are required, I notice, to give the number of pupils in their charge whose blood is mixed, and the number of those whose blood is purely African. Taking the returns of twelve schools which happened to be first set down in the consolidated report, I find it stated that, in the opinion of the teachers, the children of African blood number 287, and those of mixed blood number 777. A majority of the scholars live in the towns and cities.

In the office of the assistant commissioner, Colonel Thomas, I met several gentlemen attached to the Bureau, and resident in different parts of the State. They spoke of the condition of the negroes as being generally prosperous, but there is much hostility, they say, on the part of the native white population to Northern men. The large landowners are anxious for immigration, but it is not so with the mass of the people. It is for their property rather than for their lives that the new-comers fear; but in respect to their lives they are by no means at ease. It would be easy to multiply instances, one gentleman told me; he would give me two. Not long since Colonel S——, of Hinds County, a Southerner, and a gentleman from the North were in treaty about going into cotton-planting together, and probably would have done so. But Colonel S——, after a little while, saw with regret that it would be necessary to break off the arrangements. He informed his prospective partner that he had reliable intelligence that more than a hundred men in the neighboring county of Holmes had bound themselves to prevent the settlement of Northern men among them, and had also determined that no discharged negro soldier should be suffered to find employment in that section of country. My informant said it was beyond a doubt that Colonel S—— acted in perfect good faith.

Another case was that of Mr. A——, of Boston. He moved into Mississippi after the war, with the intention of becoming a planter, and at first was very much pleased with his prospects—so much pleased that when a little while ago he made a visit to Massachusetts, he wrote a letter to the Boston *Post* and praised his new neighbors highly. Soon he came back, and it was not long before he began to think himself mistaken. By-and-bye he became convinced that the people were too much opposed to Northern men for him to stay among them with safety. So he paid a considerable sum of money to the owner of the lands which he had intended to cultivate, was released from his bargain, and has left Mississippi.

On the last night of my stay in a Southern city I attended a political meeting, which had been called to endorse the President's recent veto message. It was held in the court-house, and was composed of about two hundred persons, who were by no means enthusiastic. Resolutions were passed, and many speeches were made, in all of which the President was lavishly praised, and the Senate and House of Representatives spoken of with great disrespect. "The war being over," said one speaker, "we were looking for peace, but it seems that the rebellion has only changed hands; that treason has reached the halls of the Congress of the United States. But there is a man at the head who is able to cope with it. President Johnson has put down the rebellion at the South, and he is now prepared to put down the rebellion at the North."

Another speaker warned the Southern people to remember that there was a party at the North, the Radical party, who would never be content

till the last silver spoon was taken from them and their lands divided; but there was also in the North a Democratic party which needed the active co-operation of the Southern people, and only needed that to hurl the Radicals from power.

The evening was not very far advanced when Col. Joseph E. Davis, a brother of Jefferson Davis, was seen upon the floor and a committee was appointed to lead him to the platform. A speech from him was demanded, and he complied, speaking three or four minutes, when, as I think, at the suggestion of the chairman of the meeting he brought his remarks to an abrupt conclusion. The Vicksburg *Journal* says:

"He fully endorsed the action of President Johnson in vetoing that accursed measure to enlarge the powers of the Freedmen's Bureau. The bill, if passed, would have caused a revolution equal to, if not more dreadful than, the one through which we have just passed. We have a branch of the Freedmen's Bureau in our midst headed by officers of the most infamous character; who hold the offices for a given purpose; who gladly record the abuses and murders of negroes, and forward such information, rather than assist our people without homes and means in obtaining the necessaries of life. You have these officers among you. I charge you to look out for them. Mr. Davis's feeble health would not admit of any extended remarks."

I might give many passages from the various speakers, but they would be wearisome. I give but one.

Mr. McKee, formerly a general in the Federal army, stepped forward and said that he approved of the veto message of the President and endorsed it fully. "But in that hall on that night he had heard language used by some of the speakers that made his blood run cold."

Though it seemed to me not very successful as a political gathering, the meeting revealed very plainly the feeling which prevails in all the Southern country. The speakers represented the South as being cruelly injured, insulted, and oppressed, and the North as her wanton oppressor.

ENGLAND.—THE DEBATE ON THE REFORM BILL.

LONDON, March 17, 1866.

THERE was very little if any visible excitement about the reform bill on the night of the debate, out of doors; no crowd, as in the days of the old bill of 1832, assembled at Westminster to cheer the advocates or hoot the opponents of reform; and even the knot of idlers which always collects round the doors of Westminster Hall on a great night, in order to see the members enter, was scarcely more numerous than usual. Inside, indeed, the House was crammed. On the floor of the House of Commons there are not seats for more than some four hundred members, so that on full nights the odd two hundred and fifty-eight have to take refuge in the long galleries which line either side of the chamber. The door-ways and passages were crowded with members, and the peers' benches were filled with representatives of the upper house, among whom Earl Russell was conspicuous. Of its kind there are, I think, few grander spectacles than the House of Commons on a great night like that of Monday. The absence of desks causes the ranks of the members to look so close and serried; the division of the assembly into two parties, seated upon opposite sides of the House, gives a life-like aspect which, to an Englishman, seems wanting in legislative assemblies where, as with you, the place where a member sits has no political significance. Then, too, the fact that the meetings are held at night, in a room brilliantly lit by gaslight, makes the scene brighter than it would be otherwise.

For the first half-hour the routine business of presenting petitions, etc., was conducted amidst a ceaseless murmur of voices, and then there was a dead silence, broken for a moment by a few not very enthusiastic cheers, when Gladstone rose to bring in the bill. The speech was expected to be one of his most brilliant efforts, and it was known he had devoted unusual care to its composition. The Chancellor of the Exchequer has, amongst other advantages, the signal one of having a figure and voice adapted for an orator. Intellectual is the epithet you would apply at first sight to his features. I don't know that they could be called regularly handsome; indeed, he is one of those men whose face has grown more and more striking as advancing years have begun to mark it. The lithe, spare figure, which would be tall if it were not for the constant stoop, the high rather than massive forehead, overshadowed by the spare hair fading from black to grey, the stern underhung chin, the clear, piercing eyes, the sharp, well-cut mouth, all constitute a picture which, when once seen, is not forgotten easily. In repose the face is very weary—sad, I think, as a rule—but the smile is wonderfully pleasant; and, when the excitement of the moment catches, the features light up sharply, and the speaker seems to become young again. His voice—a thing most rare with English speakers—is beautifully modulated in its tones, and the charm of his accent and the rhythm of his long, stately sentences would always secure him a hearing with a popular audience, even if there was little in his words themselves.

But those who heard Gladstone for the first time on Monday night did not hear him at his best. His brief, to use a legal metaphor, was not a strong one, nor could he work himself up to much enthusiasm for his client's cause. Indeed, the defects of his oratory, his love of digressions, his taste for using three words where one would serve the purpose, were palpably conspicuous. Lord Palmerston would have explained the general bearings of the bill and the causes which had induced the Government to recommend it to the House in half an hour. Mr. Gladstone lost two hours and a half or more in doing the same thing. No doubt the feat was a marvellous one, intellectually. There is not another speaker in England who could have spoken for a like period without pausing, explaining details of a most complicated kind, reviewing every argument against or in favor of each item of the bill, and yet producing an essay which, with scarcely an alteration, might have been printed verbatim for publication. But still, if the spectators of Blondin had money depending on his arriving safely from one end of the rope to another, I suppose they would get tired if he insisted on stopping perpetually to throw a somersault in mid-air. Now, the House of Commons had an intense personal interest in learning what the Government did or did not intend to propose; and though at first they marvelled at the dexterity with which the speaker contrived to glide away into some collateral consideration whenever he approached the subject of the intended provisions of the bill, yet they grew weary when this oratorical cleverness was exhibited again and again. And after all this elaborate exordium, the announcement that the Government only proposed to reduce the borough franchise to seven pounds fell singularly flat.

The real triumphs of the debate were with Mr. Lowe and John Bright, in the opinion of many who know the House intimately. Robert Lowe is the oldest of its members. Naturally enough, he has an instinctive dislike of the Chancellor of the Exchequer. Both men had much the same start in life; both were the most distinguished men of their time at Oxford; both had little assistance from wealth and aristocratic birth; both made politics their career, and yet, while Mr. Gladstone has made a brilliant success, Mr. Lowe has made a brilliant failure. Soon after leaving Oxford the former went out to Australia and made a considerable fortune at the colonial bar; but when he came back his rival had got a start which rendered competition impossible. Moreover, the turn of Mr. Gladstone's genius is, I should think, in the Italian phrase, "antipathetic" to Mr. Lowe. His subtle reasonings, his sentimental leanings, his passion for enveloping an idea in words, must all be distasteful to a mind so clear and hard and logical as that of Lord Lansdowne's nominee for the borough of Calne. I once heard Mr. Gladstone's oratory compared, by one who knew him well, to a moral shower-bath; I might say that Mr. Lowe's was like a moral hail-storm. Every sentence is short and clear; every expression tells; every word goes home. During the early part of his parliamentary career, Mr. Lowe had the reputation of an ultra-radical. His Liberalism, however, to those who looked at all below the surface, seemed always of a negative kind. He was a radical because he disliked the aristocracy, the clergy, and the landed gentry—not because he had any sympathy for the people. Somehow or other he never obtained the confidence of the public, whose instincts are generally correct enough, and he never rose higher than to subordinate posts in the Palmerston administration. Driven from office by an outcry raised by the clergymen whom he had mortally offended in his administration of the department of education, he was lukewarmly supported by his colleagues, and has since virtually joined the opposition, though still sitting on the ministerial benches. For some time past he has been laboring to form a coalition between the Tories and the Palmerstonian Whigs, and he took the lead, in consequence, in opposing reform.

The new and last reform bill labors under the defect or merit of being less extensive than any of its predecessors. It leaves the distribution of seats untouched, so that Harwich, with its 5,000 inhabitants and 334 electors, will return as many members as Manchester, with a population of 350,000 and a constituency of 18,334. It reduces the county franchise to £14, and the borough one to £7. It adds 400,000 electors to the constituent body, of whom 150,000, perhaps, will be working-men. As to its chances of being carried I hardly know what to say. Every party is so pledged to reform in the abstract, that finally Parliament may consent to pass this bill for much the same reason as a bankrupt who thinks very likely he can get off without paying his creditors anything will yet offer a composition of a shilling in order to save himself trouble and annoyance. But my own opinion is against its success. Nobody is enthusiastic about it. The Tories dislike all reform; the Whigs approve of reform in the abstract, but dislike

it in the concrete; the Radicals only accept the bill in the hope it may lead to something better. Everything will depend on the manner in which the bill is received in the country. There are a hundred members, at least, on the Liberal side who would be only too glad to throw out the bill if they could do so without the risk of losing their seats in case Parliament is dissolved. They will form their opinion as to the probability of this result by the manifestation of feeling which the next few weeks will bring forth. As yet the bill has produced no excitement whatever.

PARIS GOSSIP.

PARIS, March 9, 1866.

THE secret of the authorship of "Héloïse Paranquet," the dramatic success of the season, has been at last revealed, and the Parisians who had settled so decisively in their own minds that this new favorite was the work of the younger Dumas are furious at finding themselves mistaken. The author, M. Deschamel, in the couple of lines he has addressed to the manager of the Gymnase on the subject, thus explains the motive which induced him to offer his play anonymously: "As the three pieces I had already brought out had been unfavorably received, I felt sure that, had I appended my name to 'Héloïse Paranquet,' no manager would have even deigned to read the manuscript. For this reason I deposited my new piece anonymously in your box, leaving it to stand or fall on its own merits. I think that the result has shown that I acted wisely in so doing."

The musical season is sufficiently animated this year. Mozart's masterpiece, "Don Giovanni," is being played both at the Italian Opera, with Patti as *Zerline*, and at the Théâtre Lyrique, with charming Mlle. Nilsson in that part; the dilettante finding a special pleasure in going from one to the other, and studying the different renderings of the two favorite songstresses. It is also to be shortly brought out at the French Opera with a strong cast and new scenery and decorations. Flotow's charming "Marta" is alternating at the Théâtre Lyrique, with Nilsson as its "bright particular star," a new opera from the hand of the same favorite composer being in course of rehearsal at that house. Flotow, an assiduous frequenter of fashionable society and a passionate lover of the chase, writes his musical compositions by fits and starts, as though "possessed," when the harmonious afflatus takes hold of him. On one occasion, when he had thus composed one of his most successful cavatinas, he wrote to St. George, who had furnished the libretto of the opera, "I send you my new song; it has cost me dear—two deer and half-a-dozen pheasants. But I shall be repaid for this sacrifice if you like it, and the public *ditto*." The forthcoming opera has been shrouded in so much mystery that its very name is not known, its authors having determined to stimulate public curiosity by not allowing anything to leak out beforehand in regard to its subject or its music. But who can foresee all the possible crannies through which curiosity may peep? Last week a non-musical friend happened to call on M. Flotow, when, the conversation having naturally turned on the new work, of which the friend expressed the strongest desire to be favored with some scrap, the maestro at last consented, and played one of the airs of the forthcoming work, feeling his secret to be safe with a guest who makes no pretensions to be musical. But what was the composer's amazement and vexation when, on entering the drawing-room of a musical friend next day, his appearance was greeted with the air he had played to his unmusical visitor the day before. The charm of the melody had impressed itself so strongly on the memory of the guest that he was able to recall it exactly, and to hum it over to the other, by whom it was at once written down and communicated to other friends enchanted with the windfall. Its performance on the appearance of the composer had been intended as a compliment; but the latter, unable to give vent to the annoyance which he had so imprudently rendered possible, consoled himself by mentally vowing that he would never again let himself be caught in similar fashion.

Great curiosity is felt by the musical world here on the score of the "Coronation Mass" composed by the great pianist, Liszt (now the Abbé Liszt!), for the consecration of the new cathedral at Prague, where it was recently performed in presence of their Austrian Majesties in most magnificent style, and to be performed, on the 15th inst., at the great church of St. Eustache, under Liszt's superintendence, with the aid of Mme. Caters (Lablache's daughter) and Waut for the solos, and over a hundred of the very first singers and performers of the Conservatoire and the French and Italian operas.

George Sand has just read, in the green-room of the Vaudeville Théâtre, her new three-act comedy, entitled "The Village Don Juan," which is shortly to be produced at that house. We are also threatened with a "Classic Theatre," in which only Greek and Latin authors will be performed—Euripides, Sophocles, Æschylus, Terence, and consorts alone coming in for the honors of a hearing. Three millions of francs, it is said, have already been subscribed toward the new building, whose architect has fully completed his plans for its construction.

Lastly, in the line of theatrical novelties, may be mentioned the amusing biography, just published by Henry Lecomte, of the perennial Déjazet, who, after being the idol of the playgoing world of half a century ago, is now, at sixty-nine, the lessee, manager, and main attraction of the pretty and popular little theatre that bears her name, acting with almost the grace and vivacity of her earliest triumphs, and singing her favorite songs in a voice clear, sweet, and silvery, in defiance of time, and the charm of the "grand style" of theatrical declamation of which she is now almost the last living representative.

A new caterer for a public always hungry after novelties is just now taking Paris by storm. Talrich, the well-known maker of the wonderful anatomical models familiar to surgical professors all over the Continent, as well as at the School of Medicine of this city, has opened on the Boulevard an exhibition of wax figures, grouped together like tableaux vivants, and of most life-like appearance and character. One very striking group is of Rinaldo and Armida; another, a perfect masterpiece of artistic effect, represents Hercules and Omphale, the delicate beauty of the Lydian Queen standing out in marvellous contrast with the brawny strength of the hero of many labors. Another group represents a scene of torture of the Middle Ages, with a horrible vigor of verisimilitude absolutely terrifying. A portrait of the great surgeon Dupuytren, dissecting a body in the scene of his long labors, the amphitheatre of the Paris School of Medicine, surrounded by a group of students, though repulsive, is wonderfully life-like, and seems to exercise a peculiar fascination on the curiosity of the visitors.

The two receptions at the French Academy have been crowded, as usual, by the *élite* of the metropolis. The first—that of M. Camille Doucet, author of "Forbidden Fruit" and other plays of the same calibre of respectable mediocrity—was redeemed from flatness by the brilliant eloquence of Jules Sandeau (of whose name George Sand has borrowed, and kept, the first syllable), who, having to respond to the eulogium pronounced by the new member on the genius of his predecessor, Alfred de Vigny, evoked the memory of the author of "Destinies" with such masterly touches and such wealth of poetic coloring as to merit comparison with Rubens transfiguring with his pencil of fire and his palette of gold the sketches of Jordaens. The second reception, that of M. Prévost-Paradol, had excited public curiosity to an unusual pitch. Every inch of space in the hall of the Academy had been secured three weeks ago by the happy mortals who are on begging terms with the immortals. The *queue* was formed as early as ten o'clock, and when, at one, the doors were opened, the rush was terrific. Little attention was paid to rights—those who squeezed and fought their way in first taking the best places, and generally keeping them, despite the excited complaints of those who found themselves thus unceremoniously dispossessed. The new member's eulogium on his predecessor, M. Ampère, was warmly applauded, and M. Guizot, on whom devolved the task of replying, was received with great cordiality. The affair was, on the whole, the most brilliant that has taken place for some years in the narrow regions of the Paris Olympus. But the fact cannot be disguised that personal and social influences play too active a part in the elections to the vacant armchairs of Richelieu's providing, and Amedée Thierry, who has failed three times in his candidature for a place in the Academy, is not the only one of the solid glories of French literature who is set aside while writers not worthy "to loose the latchet of their shoes" are welcomed with acclamations to a seat among the "Immortal Forty." STELLA.

Correspondence.

GENERAL SHERIDAN DEFENDED.

TO THE EDITOR OF THE NATION:

In your issue of March 29th, an article entitled "Warren and Sheridan at Five Forks," reviewing and endorsing the pamphlet on this subject lately published by General Warren, is unjust to General Sheridan, who is unheard, except through his brief official report of operations in the last campaign. General Sheridan's headquarters are in New Orleans, and he may not see this article, or, if he does, may not feel called upon to produce other reasons than he has already officially furnished for his action in regard to General Warren, as he would doubtless prefer not to enter into a controversy of this sort; nevertheless, the readers of THE NATION, in simple justice to General Sheridan, ought to be allowed to look at both sides of this question.

General Warren's pamphlet, of course, presents his case in the most

favorable light, and no fault is found with THE NATION for sympathizing with him; neither is it now proposed to reply to his pamphlet, but only to dispute, as may fairly be done without prejudice to General Warren, the conclusion of THE NATION that "the question of facts is easily settled against General Sheridan." In doing this it will simplify the matter to take in turn the numbered paragraphs of THE NATION's review.

1. It is true that the night of March 31st–April 1st was dark, and the rough country about Hatcher's Run in a terrible state for army movements, but it was not stormy, in the usual sense of the term. It did not rain, and the state of the country had not, during the day, prevented a large body of the enemy's infantry from repulsing General Warren's corps on the White Oak Road, and then rapidly marching several miles to confront General Sheridan, who fought one of the severest cavalry battles of the war in his successful effort to hold Dinwiddie C. H. against this superior force, all of which movements are detailed in General Grant's official report.

What were "the expectations" of the Lieutenant-General *does* appear on turning to the official report of General Sheridan, to which is attached the despatch of General Grant in relation to the reinforcement ordered to his support at Dinwiddie C. H. This despatch reads as follows:

"DABNEY MILLS, March 31, 1865, 10.05 P.M.

"MAJ.-GEN'L SHERIDAN:

"The 5th Corps has been ordered to your support. Two divisions will go by J. Boisseau's and one down the Boydton road. In addition to this I have sent McKenzie's cavalry, which will reach you by the Vaughan road. All these forces, except the cavalry, should reach you by 12 o'clock to-night. You will assume command of the whole force sent to operate with you, and use it to the best of your ability to destroy the force which your command has fought so gallantly to-day. U. S. GRANT, Lieut.-Gen'l."

It will be seen that his expectations were that General Warren's corps would reach General Sheridan by 12 o'clock that night.

It is a little obscure at what headquarters "it was understood that Sheridan was much more likely to retreat than to hold his ground." Certainly not at General Grant's. Nothing in his action indicates any such understanding, and General Sheridan had written to him, as we find in the official despatch, "I will hold out at Dinwiddie C. H. until I am compelled to leave." General Meade would hardly assume the responsibility of understanding General Sheridan's condition one way or the other. It is not likely that he did more or less than the orders of the Lieutenant-General required, nothing in this instance having been left to his own discretion. And at General Warren's headquarters there could have been no misunderstanding, for General Sheridan, anxiously waiting to hear from him, took the precaution at 3 A.M., on April 1st, as the official report records, to send him orders in regard to the attack to be made at daylight on the enemy's lines in front of Dinwiddie C. H., and, writing from the Court House, added: "Do not fear my leaving here. If the enemy remains I shall fight at daylight."

It will of course not be disputed that General Warren, as soon as ordered to report to General Sheridan, was bound to obey his orders and endeavor to carry out his intentions against the enemy, and, though he were ordered by the Lieutenant-General, through General Meade, "simply to reinforce" General Sheridan, he must reinforce him in such manner as General Sheridan might direct.

In regard to the retreat of the enemy at Five Forks, General Sheridan says, speaking of the battle of Dinwiddie C. H., "The enemy lay on their arms that night, not more than one hundred yards in front of our lines." And again on April 1st: "I moved my cavalry force at daylight against the enemy's lines in front, which gave way rapidly, moving off by the right flank, and crossing Chamberlaine's Creek." Again: "Meantime General Merritt's command continued to press the enemy, and by impetuous charges drove them from two lines of temporary works; * * * about 2 o'clock the enemy was behind his works on the White Oak road (Five Forks), and his skirmish line drawn in." It appears, then, that the enemy did not retreat to Five Forks during the night, but was in position to be attacked at daylight, as General Sheridan had directed. But supposing General Sheridan to be wrong about this—that he did not see the enemy's lines give way when he moved out his cavalry at daylight, certainly, at that time, no portion of General Warren's command was where the enemy *had been*, and, therefore, no person in that command is good authority as to whether the enemy remained or not.

So much as to the bearing of the official orders and despatches upon "the question of facts," and now, perhaps, a temperate reply to the views expressed by THE NATION, in paragraphs two and three of this article, may be permitted.

There is no question between General Sheridan and the division commanders of the 5th Corps, and he does not say anywhere that he found them wanting in soldierly interest and alacrity. No doubt each division commander in the army would freely testify that he had always, under all circumstances, formed his troops with alacrity for battle; but this testimony would not prove that he was always incited to alacrity by the example of his corps commander. He would rather give the impression that he was himself the sole agent in giving life to the movement of his troops in an important crisis. General Warren knows his own thoughts, and if, as THE NATION reports him, he "was delighted and eager to serve under Sheridan," it is unfortunate that on this occasion he did not give evidence of a hearty desire to co-operate in the proposed movements, for it cannot be conceived that General Sheridan could so far mistake delight and eagerness as to be led to say, officially, "his manner gave me the impression that he wished the sun to go down before dispositions for the attack could be completed." There was no agreement to attack at 4 o'clock, and no question of punctuality to that hour. From the moment the cavalry was in position in front of the enemy's works at Five Forks, General Sheridan was eager to get up the 5th Corps for the flank attack. He chafed under the delay, and was waiting, not for an hour, but for the troops, to arrive. Had General Warren mounted his horse, in response to the urgent demands for haste which General Sheridan made, and, riding through his command, urged forward the officers and men; had he busied himself, as without indignity he might have done, in the quick formation of his troops; had he appeared on the field, as General Sheridan did, realizing the opportunity and fired with enthusiasm, showing by his example that he believed in success, and thus inspiring the faltering troops, General Sheridan could have had no motive to relieve General Warren that would not have given way before his admiration of his hearty co-operation. Seeing General Warren's continued apathy after the action had begun, he relieved him from command at the first practicable moment, and, although the nation declines to enter into his motives in so doing, may it not be fairly assumed that, as the facts are not against him, his motives were of the simplest? Not because he doubted General Warren's loyalty or courage, for to doubt either would be ridiculous, as General Sheridan very well knew, but because he found that General Warren, through a natural depression resulting from a recent disaster to his command, or from other causes best known to himself, did not believe in victory, and was not sanguine of complete success in this campaign, and was, therefore, a clog to the impulse which General Sheridan had determined to give to all the force under his control, in the hope and belief that, by so doing, the army would soon be done with war. Is not this view strengthened by the extraordinary fact that the Lieutenant-General sent with General Warren unsought authority to General Sheridan to relieve him from command? "Authority for this action having been sent to me before the battle, unsolicited," General Sheridan officially reports. Does not this remarkable action on the part of General Grant satisfy everybody but unreasonable partizans that General Warren was well known to be in a frame of mind incompatible with the vigor and enthusiasm so vital at this juncture? It is almost needless to add that, although General Warren was assigned by General Grant to other commands, doubtless for good reasons, it is not possible, as THE NATION seems to imply, that the Lieutenant-General was surprised at his removal from the command of the 5th Corps, or that he promptly employed him elsewhere to evince his disapprobation of General Sheridan's action. It is hard to see what unworthy motive could actuate General Sheridan. He had already attained the highest honor the Government could bestow. He had fought through the war, and conducted brilliant campaigns, without robbing his fellow-officers of their just praise, and it is unfortunate that, in the interest of his good name, it is now necessary to disprove a one-sided narration and an assertion that a question of facts is easily settled against him. And it is still more unfortunate that he must be defended from the inference that he deliberately sought to get the credit belonging to a fellow-officer by using his superior authority to disgrace him. As the charge has been made, fairness demands a hearing for the defence, and as to the impartial reader's verdict no doubt is felt by

A STAFF OFFICER.

PHILADELPHIA, March 30th.

A NOTE FROM MR. DICEY.

TO THE EDITOR OF THE NATION:

In the letter of the New York correspondent of the *Spectator* of the week before last, I read with astonishment the following statement: "If that were true" (namely, if the Americans were cowards), then indeed would Mr. Dicey's assertion in his "Federal States" also be true, "that 50,000 French troops could march from one end of the country to the other."

I have a fortunate faculty for forgetting what I write myself, and so I turned eagerly to the volume in question, to discover what I could have stated to justify such an assertion. I find, on referring, that in discussing the military organization of the American volunteer armies, in a letter written at the time when McClellan was only just beginning to arrange the unwieldy masses of the Potomac army into something like order and discipline, I used the following words:

"The English officers who came down to Washington to inspect the army were always very confident in their assertions that it would have no chance against a small force of well-trained troops. I agree with them so far that I think it possible that a French army of 50,000 men might march from New York to New Orleans, and defeat any force it met on its path, but when that was done no vital result would be produced; and with 50,000 men it would be impossible to occupy more than a single State."

At the time at which I wrote this letter home, no belief was more popular in England than the idea that, if any great European power chose to interfere in America, it would find no difficulty in imposing its will upon the combatants. It was against this idea that I was arguing, as anybody might see who took the trouble to read the chapter in which the passage quoted occurs.

One of my many heresies is a belief that untrained volunteers are not a match for trained troops, till they have learnt their trade of soldiering by actual experience. I believed then, and I believe still, that in 1862 50,000 French troops would probably have defeated any force that either North or South could have brought against them at one point; and I believe now, as I stated then, that such an intervention would not have affected in any way the final result of the war. How far my statement, as to the possibility of

a trained army marching across the continent, has been borne out by the triumphant march of Sherman's veterans in 1865, is a matter of opinion.

I trust I have said enough to show that I did not indulge—as the correspondent represents—in a silly sneer against the learning of American newsmen. That I was not likely to have done so would, I should have thought, have been known to every one who ever read any of my writings, and to none more than "A Yankee" himself.—I am, sir, your obedient servant,

EDWARD DICEY.

LONDON, March 17.

A NAUTICAL CRITICISM.

TO THE EDITOR OF THE NATION:

Does n't a ship at anchor always bring up with her head to the wind? and if so, how can there (then) be any leeward shrouds?

Yours, CARL BENSON.

[Our correspondent is right in the criticism implied by his questions. We did not state the whole case against the picture mentioned in our last. The essential error was that to which Carl Benson calls attention, the fact that there *was* a leeward and a windward side to a ship riding at anchor. The sea was running high and breaking over the port-bow, the spray driving across the deck, and men the while going aloft by the starboard shrouds; the whole *status* unaccountable while the ship was visibly anchored.—ED. NATION.]

Literature.

LITERARY NOTES.

THE United States possesses no great national library, and the slow growth and niggardly appropriations for the Library of Congress for many years past have not indicated any prospect that the deficiency would ever be supplied. The reasons are obvious why our national capital cannot be expected to furnish library facilities to the scholars of this country at all comparable to those of London or Paris. Yet there is no reason why Washington should fall behind New York or Boston in its collection of books of practical value, or why our only national library should continue poor in all that relates to the discovery, settlement, and natural and political history of our own country. A legislative body for a great and populous continent like our own should have at command a library filled with all that can illustrate the immense range and diversity of subjects upon which it is called to legislate; and our national library should be a great library of reference, where the men of letters and science of our own and other countries, who visit Washington, should be sure of finding competent aids in their researches. We would not insist that such a library should possess absolutely every American book, though it would ultimately be a highly important service to literature and its history in America to find upon the shelves of some great central library (and what one so proper for the purpose as the Government library at the national capital?) a complete representation of what the country had produced, however valuable or however valueless it might to some appear. As one step in the right direction, we notice that a bill has recently passed the Senate to transfer the custody of the Smithsonian Library at Washington to the Library of Congress. This will enlarge the latter library, as we learn, by some 40,000 volumes, raising it at once to the front rank among American collections, and going far toward completing it in what it is now most deficient in, namely, works devoted to science and the arts. We may before long expect to see the Library of Congress the largest, as it already is one of the most select, in this country, with proper liberality in the Government appropriations, and intelligence in their expenditure for its increase. We can see no good reason for building up two separate large libraries at the seat of Government, and the concentration of these two into one fire-proof building, if properly arranged and intelligently catalogued, must result greatly to the benefit of all who desire to consult books at the national capital.

—Mr. David G. Francis is on the eve of republishing "A Bibliographical and Critical Account of the Rarest Books in the English Language," by J. Payne Collier, F.S.A., a work of which it is not easy to speak too highly. The amount of labor involved in reading the books described in its pages, or in skimming over them sufficiently for ordinary bibliographical purposes, is not large; but the labor which does not appear is immense, extending, as must in such cases, over many years, and calling for as much patience as industry. In regard to the rarity of a volume, for instance, the student frequently finds that he was mistaken, his supposed rare book turning out to be quite well known to scholars. It costs much time and more reading to master even the alphabet of bibliography. Mr. Collier began his bibliographical career about sixty years ago (he is now seventy-nine)—when he became possessed of Wilson's "Art of Logic," printed by Richard Grafton in 1551, from which he ascertained that "Ralph Roister Doister" was older than "Gammer Gurton's Needle," and that its writer was Nicholas Udall—and has continued it ever since, occasionally making literary discoveries, the most important of which is assuredly *not* the famous Perkins folio. Through good and evil report he has pursued his way, and the result of his labors in one direction is the work which Mr. Francis is reprinting. Akin in spirit to the "Censura Literaria," "Restituta," and other publications of Sir Egerton Brydges and his coadjutors, Park and Haslewood, it differs from those works, which are largely taken up with well-known though comparatively rare writers, in that it describes only the rarest—those which are now known to be such, having been unearthed from their ancient hiding-places within the last sixty years by Mr. Collier and other scholars and collectors, with what pains and at what uncounted cost! It also supplements the works mentioned, since it contains entirely new matter, Mr. Collier stating that he has never criticized, scarcely quoted even, a volume mentioned by others. The abundance of the material which he has brought to light is surprising—much more surprising than its literary value, of which, in some cases, the less said the better. He reproduces the "Bridgewater Catalogue," which he prepared about thirty years ago for the first Earl of Ellesmere, the whole impression of which, consisting of only fifty copies, was distributed as presents—a princely but unwise proceeding: unwise as regards the smallness of the edition, which Lord Ellesmere afterwards regretted, authorizing Mr. Collier to reprint the work when he chose. Familiarity with a portion of the ground gone over by Mr. Collier, and a considerable reading of what other bibliographers have written thereon and thereabouts, incline us to place his work at the head of its class in English. The only one which will at all compare with it in cleverness of research is Corser's "Collectanea Anglo-Poetica," and that, which is printed for the Chetham Society and therefore not accessible to ordinary purchasers, is still unfinished; it makes, besides, no claim to the description of rarities exclusively. The original edition of Mr. Collier's book is in two large octavo volumes of between five and six hundred pages each. Mr. Francis's reprint will be in four volumes crown octavo, of between three and four hundred pages each. There is no comparison between the two in the essential of a handsome volume, the English copy being clumsy and not especially well printed, the American almost perfect of its kind. The edition is small, consisting of a limited number of copies of the ordinary size and seventy-five copies on large paper.

—Two new Sanscrit dictionaries have lately been published, one in French, the work of Messrs. Emile Burnouf and L. Leupol, the other in English, a compilation by Theodore Benfey, professor at the University of Göttingen, edited by Max Müller. A great advance has been made in the knowledge of Sanscrit in Europe since Anquetil Duperron first discovered the existence of a Sanscrit dictionary of native origin, and since Sir William Jones revealed the beauties of the ancient Hindu drama to his countrymen through his version of "Sakuntala." Neither of these scholars can be considered profound in Sanscrit. Duperron blundered at the very threshold of the "Amarakosa," of which he could not have known much beyond the name, while Sir William Jones paraphrased rather than translated the sufferings of the noble Hindu maiden. Later came Colebrooke, who published the original text of the "Amarakosa," and an English interpretation of it. The late Horace Hayman Wilson, in the first edition of his dictionary, made some advance on Colebrooke's labors towards making the study of Sanscrit practicable without the aid of native teachers; but in reality accomplished little beyond translating and verifying what had been collected and arranged by learned natives attached to the College at Calcutta, a mass of useful material, no doubt, but not free from the suspicion of having been gathered in the furtherance of special interests. His second edition is but a slight improvement on the first, omitting, as it does, authorities, and containing but little new matter. In fact Sanscrit philology has rather languished in Europe since the death of Eugène Burnouf, who has left no successor worthy of him, except, perhaps, Adolphe Rignier, who is excellent in all that he undertakes. Two good Continental scholars, Messrs Böhtlingk and Roth, are understood to be pursuing Sanscrit studies, as likewise Professor Goldstücker in England, but as their labors have not been given to the public, their value cannot yet be determined. In the meantime the students of Sanscrit literature will have to content themselves with the old authorities, however imperfect, and the two dictionaries mentioned above, the merits of which are rather

comparative than positive, neither thoroughly fulfilling the requisites of a standard Sanscrit dictionary.

—The Emperor Napoleon's "Life of Cæsar" has been productive of numerous *brochures* against him, the latest of which, "L'Histoire du Nouveau César," by P. Vésinier, is having a surreptitious circulation in Paris. Inferior to the famous "Propos de Labienus," it is still a brilliant specimen of invective, the writer never degenerating into dulness, though he is often libellous. He relates many amusing anecdotes of Louis Napoleon's early life, especially in reference to the failures at Strasburg and Boulogne, but he adds so many that evidently were calumnies as to deprive his work of all historical value.

—The Rev. W. W. Shirley has recently issued, through the Clarendon Press, Oxford, "A Catalogue of the Original Works of John Wyclif," his object being to collect information concerning Wyclif's manuscripts, their chronology, or their connection with each other, for the purpose of publishing a satisfactory edition of his works. What Wyclif wrote in Latin seems to be pretty well established, but the greatest confusion exists in regard to his English writings, the very popularity of which, at their time of production, when they circulated in a multitude of forms, has added to the difficulty of subsequent research concerning them. To reduce this chaotic confusion to order, as far as possible, is the motive of the catalogue, which is the result of researches in England, Prague, Vienna, and Paris, and the cause of its publication.

—The deep hold which the ancient myths of Greece have taken in the soil of their nativity, or most favored transplantation, is shown in "The Greek Almanac for 1866," in a translation therein of a privately printed paper by M. Lehon on the mythology of modern Greece. There was formerly a colossal statue of Dêmêter, now at Cambridge, which was reverenced by the modern Eleusinians as Saint Dêmêtra, and, when it was removed, her worshippers grieved sorely, believing that the fruitfulness of the Eleusinian plain had departed with it. Concerning this statue, or rather the saint after whom it was named, who was, of course, a Christianized reminiscence of the goddess Dêmêter, there was a popular legend which M. Lehon heard from a Greek priest, who by his own account was more than one hundred years old, and which was to this effect: Saint Dêmêtra, an old woman of Athens, poor but devout, had a daughter of surpassing beauty, whom a Turkish aga of Epeiros, who was skilled in magic, beheld one day as she was combing her long golden locks. He made fierce love to her, but she repelled all his advances; so on Christmas night he broke into Saint Dêmêtra's house and carried off her daughter on a black horse swift enough to pass in a few minutes from Athens to Epeiros. The afflicted mother wandered about looking for her child, but found no tidings of her until she fell in with a stork from whose nest she had once driven a ravenous bird—a kindly act which was remembered by the grateful bird, who related the manner of her daughter's abduction, and promised to guide her on her journey. They wandered on in the cold wintry weather, and no one would receive them except the wife of the hadji-bashi, or local magistrate, of Eleusis, who gave them help and comfort, while Saint Dêmêtra in return blessed them and promised to make the plain fruitful. Now, this charitable pair had a beautiful and brave son, who volunteered to go in search of the lost maiden provided he might have her for his wife when she was found. He set forth in company with the stork, and after a time saw a great fire where there was a vast pot boiling, surrounded by forty serpents. He lifted the pot with one hand and put it down again, whereupon the serpents told him that he was surely the man to rescue a certain damsel who had been imprisoned by a magician in a tower near by, and whom they had wished in vain to carry off. They took him to the tower, which he ascended by the means of large nails, taking out the lower ones as he rose, lest the serpents should follow him. At the top he beckoned them to follow, and slew them one by one. In the tower he discovered the daughter of Saint Dêmêtra, with whom he fell in love. The aga coming in, the rivals struggled and fought for three days and nights, the magician having the advantage of changing himself into different shapes. At last he killed the youth and cut him into four quarters. The stork, however, who had witnessed the struggle, flew away and returned with a medicinal herb of such power that when it was placed between the lips of the slain man his dissevered body came together, and he arose alive, and renewed his combat with the aga, whom he only overcame after three days more of hard fighting, by vowing to become a monk. The aga was finally overthrown, the stork completing the work by pecking out his eyes and pulling from his black head the single white hair on which his life depended. The maiden was restored to her mother; the young man went into a monastery; and Saint Dêmêtra departed with her child, leaving, as she went, the blessing of fruitfulness on the plains of Eleusis. Such is the form which the old pagan myth of the sowing of corn has assumed in modern Greece, from which it and similar corrupt remembrances of its beautiful early fables are rapidly passing away, living no longer in the hearts of its people, though still "a joy for ever" to the rest of the civilized world in the pages of its immortal poets.

—That "Puck of Commentators," as some one has called him, Stevens, who, to his other accomplishments, is suspected of adding the doubtful one of forging, or causing to be forged, a portrait of Shakespeare, declared of the latter's sonnets that "the strongest act of Parliament that could be framed would fail to compel readers into their service." Not so think his brethren of the present time, who have gone into raptures over them, and devoted volumes to their elucidation, so far, it must be confessed, with no very signal success, and with a singular want of agreement—one maintaining that the lovely youth whom the poet celebrated was his nephew (who, by the way, died at the age of ten, or thereabouts); another, that he was a mythical personage named Hughes; and a third, that he was Queen Elizabeth herself! Mr. Charles Armitage Brown, the friend of Keats in his last days, broached, about thirty years ago, the theory that Mr. W. H., whom the printer Thorpe declared to be the "onlie begettor" of the sonnets, was Mr. William Herbert, afterwards Earl of Pembroke. This theory is now generally acquiesced in, though questioned in France by Philarete Chasles, who has one of his own which we have never been able to understand, and in Germany, where Professor Bodenstedt and others maintain different views. A new claimant for honor in this field of Shakespearian study is Mr. Gerald Massey, one of the minor English poets, who has written a volume which the Longmans are about to publish, under the title of "Shakespeare's Sonnets never before interpreted; his Private Friends identified; together with a recovered Likeness of Himself." We are not fully informed of Mr. Massey's theory, but we understand it to be substantially that of the writer of a paper in the "Quarterly Review" for April, 1864 (who may have been Mr. Massey himself), viz., that the sonnets, instead of shedding any light on the life and feelings of Shakespeare himself, as many suppose, were really written for pay for other people, chiefly for his patron, the Earl of Southampton, in relation to his progress at court and his courtship of Elizabeth Vernon, who afterwards became his countess, much to the dislike of Queen Elizabeth, who had no fancy for seeing her favorites become Benedicts. We shall soon have an opportunity of weighing the arguments, if he offer any, by which Mr. Massey hopes to prove this novel view of the question. In the meantime we hold to the opinion of Mr. Brown, that Mr. W. H. was my Lord Pembroke, whose poems, with others that were not his, were given to the world long after his death by the rather disreputable son of the poet Donne.

—Dr. Whewell, the late Master of Trinity College, was in many respects a remarkable man. Born at Lancaster, towards the close of the last century, the son of a tradesman in that town, he was sent to Trinity in his seventeenth year, a raw country youth, of whom, and his proficiency in his native tongue, a good story is related, to the effect that when he was lounging one day at the college gate he saw a herd of swine driven by, which drew from him the following soliloquy: "They 're a hard thing to drive—very, when there 's many of them—is a pig." Two years later the raw country youth gained the Chancellor's prize of a gold medal for a poem entitled "Boadicea," and in another year he was second wrangler on the mathematical tripos. Fellow and tutor in due time, he was elected professor of mineralogy in 1828, and was an active worker with Peacock, Herschel, and Babbage in the reform of the university mathematics. He wrote largely on mechanics, mathematics, and kindred subjects, beginning with the "Bridgewater Treatise on Astronomy," which was followed by the "History of the Inductive Sciences" and the "Philosophy of the Inductive Sciences," the works by which he is best known. Accepting the professorship of moral philosophy in 1838, he held that office till 1855, becoming, in 1841, Master of Trinity on the resignation of Dr. Wordsworth. He edited Sir James Mackintosh's "Introduction to the Study of Ethical Philosophy," and published a couple of volumes of his own on "Morality;" the "Ethical Dialogues of Plato;" "Lectures on Political Economy;" "Architectural Notes on Churches in France and Germany;" and "Some Specimens of English Hexameters," the last in a volume containing similar efforts by Sir John Herschel, Archdeacon Hare, and Lockhart, the son-in-law and biographer of Scott. Dr. Whewell, in short, was one of those active, restless men who are never happy except when busy, work of some sort being their life. He wrote well on many subjects rather than exhaustively on any one, though he himself would have been the last person to perceive the fact, or to confess the justice of Sydney Smith's gibe, that "science was his forte, and omniscience his foible."

—A satisfactory edition of Chaucer is something to be desired, for since all the early editions, which were printed from corrupt copies, no editor has taken the pains to compare the poet's works with the best manuscripts, and to correct the text accordingly. This is now to be done for an edition in progress—the editor of which, Mr. Richard Morris, follows the London and Oxford manuscripts, Mr. Lumley helping with those at Cambridge, while an experienced copier has been sent to Glasgow to read "The Romaunt of the Rose" with the magnificent copy there. Mr. Bond, of the British Museum, has, in his antiquarian researches, come upon some fresh traces of Chaucer which are soon to be published. Altogether the prospects for a standard edition of "old Dan Chaucer" are favorable.

—The brother of Heine is about to publish in the *Gartenlaube*, a German illustrated paper, a series of letters entitled "Recollections of my Brother Heinrich Heine," a specimen of which has already appeared, and which touches on the relation between the poet and his uncle Solomon, the banker, the richest man in Hamburg. There was a perpetual war between them on the subject of money, which Heine, like the poet that he was, despised, and which his uncle, like the banker that he was, loved and hoarded, which did not, however, prevent him from giving away large sums in charity. He was generous to his brilliant but erratic nephew, though he lectured him on his extravagance, a circumstance which led the former to leave Hamburg as often as he could induce his uncle to give him money to travel with. On one occasion, after he had finished his tragedy of "Radcliff," he found the banker at breakfast, in good humor, and announced to him that he wished to visit the country in which its scenes were laid—England. "Go," said Uncle Solomon. "Ay, but living is dear in England." "You received money not long since." "True, that will do for my expenses; but for the honor of the name I want a decent credit with Rothschild." A letter of credit for ten thousand francs was given him, with the understanding that it was only a matter of form, and was not to be used, his mother having put into his purse one hundred louis d'or. In less than twenty-four hours after his arrival in London, Heine presented the letter to Baron James von Rothschild, who cashed it. A few days later, when Uncle Solomon opened his letters at breakfast, he found one from Baron James, telling him "that he had had the extreme pleasure of making the personal acquaintance of his celebrated, charming nephew, and that he had had the honor to pay four hundred pounds to him." The pipe dropped from the old banker's mouth, he ran up and down the room, cursing at Heine and Rothschild; at last he went to the poet's mother, whom he lectured on the total depravity of her son. She wrote the dear boy by return of post, but neither her letter nor his uncle's anger troubled him. One passage in his answer was substantially as follows: "Old people have caprices; what my uncle gave in a fit of good-humor he might take back in ill-humor. I had to make sure. Who knows but in his next letter he might have written to Rothschild that the letter of credit was only a mere form; there are enough examples of the sort in the annals of rich bankers' offices. Indeed, my dear mother, men must always make sure; would uncle have become so rich if he had not always made sure?" On Heine's return to Hamburg there was, of course, a sermon, to which he listened in silence; when it was finished he said, "The best thing about you, uncle, is that you bear my name," and left the room. They soon made up again, and to the end of his sadly afflicted life Heinrich Heine, poet, had no better friend than Solomon Heine, banker.

—One of the greatest rarities in the collection of the late Mr. George Daniel, of Islington, author of "Merrie England in the Olden Time," "Love's Labor not Lost," and other not very readable works, was a collection of old black-letter ballads, amounting to seventy in all, printed between the years 1559 and 1597, which Mr. Daniel bought at a reasonable rate, as he did most of his curiosities, but which realized £750 at his sale. This collection is about to be reprinted by its purchaser, Mr. Frederick Huth, a well-known collector, as his contribution to the members of the Philobiblion Society, a close corporation of amateurs, whose publications are very limited in impression and only for private distribution.

ARCHITECTURAL REFORM.*

Of all the fine arts architecture is that which has the closest connection with the practical requirements of life. Its very existence is based upon necessity, and therefore wherever men live some form of it must appear, varying in quality according to the conditions of the society in the midst of which it has grown. Its characteristics have been governed by those conditions to such an extent that when we are engaged in archæological research regarding any people, their architectural remains form an important and sometimes the only basis of judgment by which we can arrive at a definite opinion touching the nature of their civilization. A deduction by reason from these primitive types of art to the circumstances of their peculiar development is natural and easy, and the result, in our minds, is intelligible and distinct. We recognize the ancient Egyptian in the temples of the Nile; we know the Greek when we have studied the fragments at Athens and the Greek colonies; the most eloquent type of Roman empire is in the shattered temples, baths, arches, aqueducts, and basilicas of antiquity; and the mediæval mind is present to us intact in the churches, monasteries, castles, and town-halls built from the eleventh to the fourteenth centuries. These impressions are, to a certain extent, spontaneous, but are developed and deepened, not changed, by deliberate analysis.

Now, in the entire absence of a standard of architectural criticism in this country, as applied to our own daily use, it is of the first importance that we should understand how it is that history has expressed itself so plainly and so intelligibly in the architecture of the past. It is evident that the solving of this question involves a theory of architecture capable of application to the most common uses of the art among us—a theory which, when once understood, will enable the public to sympathize with the architect, to relieve him from his isolation, and restore that mutual confidence and interest between them and him without which there can be no real and national art. At present, popular opinion, where there is any at all, is based upon the merest caprice or prejudice; patronage is wofully misbestowed; quacks flourish, and the true architect is misunderstood and neglected. Without the intelligent sympathy of the public this art cannot live and progress; the architect needs to be sustained, protected, encouraged, chastened by the consciousness that the people understand what he is doing. Caprice and fashion, with their infinite and childish vagaries, must give place to a public appreciation of the architectural problem not as a mere matter of taste or even as a question of art—this would be expecting too much for the present—but as a matter of reason and common sense.

One of the first results of a revival of interest in architecture in the Old World, particularly during the last century, was the multiplication of archæological works illustrating certain local or temporary phases of the architecture of the past. Thus, the great architectural writer of Roman antiquity, Vitruvius, was translated, edited, and illustrated by almost innumerable architects from the fifteenth to the nineteenth century; the result was the reproduction throughout Europe during this period of forms borrowed from Rome; it was the period of the Renaissance, a period when all architecture was governed by Vitruvian rules variously interpreted, when nothing was done without a Roman precedent to support it, and everything in art was judged according to Roman authority. Then came writers on Greek art, led by Stuart and Revett, who, on their return from Athens in the last century, gave to the world the results of their accurate admeasurements of the temples and monuments of Greece. In this manner a certain Greek element was introduced into modern architecture. Later the German antiquary, Boiserée, published, at Cologne, his works on mediæval architecture hitherto despised. He was followed by numberless others, copying, editing, and restoring the details of nearly every cathedral in Europe. Thus arose modern mediævalism, and with it an interminable controversy between those who yet clung to the principles of antique architecture, and designed according to Vitruvius and his followers, the Italian masters of the fifteenth century, and those who embraced the new architectural religion revived from the Middle Ages, and built churches and chapels after the manner, but not according to the principles, of the freemasons of feudalism.

This controversy has created a new Babel in modern architecture. There is a confusion of tongues worse than that which interrupted the building of that famous architectural unity on the plains of Shinar. Eclecticism has arisen. Architects, embarrassed by precedent, impeded by their knowledge of the past, have produced an unintelligible polyglot made up of Egyptian, Greek, Roman, Saracenic, Byzantine mediæval types, mixed together in various proportions, which we must distinguish as the architecture of the nineteenth century. It has found its way in a diluted form to the New World, where it has been uttered in town and country with increasing bewilderment to the people.

In the midst of this embarrassing complexity, and in the pressing need to repair once more to the primitive fountains of art for refreshment and inspiration, and for that new knowledge which discusses, analyzes, and compares, a purely literary element has been introduced into modern architecture, with the intention of instituting a careful and philosophical examination into the whole question of the proper use of precedent, of eliminating all the perplexing points of controversy, and thus of arriving at some theory of archi-

* "Entretiens sur l'Architecture, par M. Viollet-le-Duc, Architecte du Gouvernement et Inspecteur Général des Edifices Diocésains." Paris: A. Morel & Cie. 1863.

tecture from which may proceed a new and more wholesome progress, a style peculiar to our time, not an imitation nor a conglomerate, but a logical deduction. This literary element is represented in England by John Ruskin, who, with all his faults, may almost claim to have accomplished, in that country, with his pen that which hitherto in the history of architecture has only been accomplished by the great organic movements or changes of society, a revolution. He, at least, is the most prominent among those who have created the present tendency among English architects to design and build more according to reason and less according to prejudice or fashion. Whatever the result may have been so far, it cannot be justly doubted that for the first time in five centuries there exists in the mother country a theory of architecture which can be applied by architects to practice, and by the intelligent public to criticism. And this is a state of things which is full of promise for the future. However much we may differ from Ruskin in detail, and however much we may distrust his glittering and seductive eloquence, this fact is undeniable—that he has created an atmosphere which is wholesome for art. The mysterious agencies established by the freemasons in Europe during the Middle Ages, by which their various phases of progress from good to better were made simultaneous throughout a continent, is more than equalled by the modern diffusion of books. So we have already experienced in this country somewhat of this new feeling in architecture. We read Ruskin and his followers, and people here begin to take an interest in the subject of which these writers are the ministers. The fundamental result of their teachings, as regards the actual practice of art, is the application of the idea of *truth of expression* to design in the place of that mere correctness of imitation, that servile adherence to archæological precedent and authority, that reproduction of styles which, until now, has held sway in all modern architecture. The most advanced of these teachers hold that architectural precedents are not mere formulæ on which all design must be strictly and correctly modelled, but that they constitute, as it were, a dictionary of phrases, a grammar of form, to be referred to not for its own sake, but to give scope and freedom to the language of art. The problem presented to the architect is simply this: Given a subject, to develop it with all the grace and elegance which a perfect command of language and a complete knowledge of grammar can confer upon the art of composition. This problem accepted, a national path of progress is open to art. Then it is for genius to render the incident of this progress illustrious by great works. Individual genius cannot take all progress upon its shoulders and achieve an era of art. In architecture, as in the other arts, it can only accomplish illustrious results when surrounded by a prevailing atmosphere of intelligent criticism, which sympathizes, encourages, and applauds. The analogy between literature and the fine arts is, in all these respects, complete.

The English mind is not sensitive to the appeals of art; it moves sluggishly in grooves of conventionalism and custom, and is extremely jealous of change or innovations. Mr. Matthew Arnold's charge of Philistinism against the English people is sustained by a study of the development of their arts. No nation has exhibited such a profound respect for the archæological side of architecture, or has transferred precedent to modern uses with such pedantic and unimaginative precision. Foreign influences have been rigorously excluded, save those derived through Italy and Greece from classic antiquity; and even these, before becoming current, have had to pass through the alembic of Sir Christopher Wren or Sir William Chambers. Their modern Gothic has been a bold and unpoetical imitation of their mediæval Gothic, which, for the sake of mechanical convenience, has been artificially divided in their books into Norman, early English, decorated, and perpendicular periods. In short, their architecture has been antiquarianism—nothing more or less; and yet, by the establishment of new schools of architecture, based upon the common-sense principles to which we have referred, there has arisen among them a prevailing sentiment of healthy criticism, the practical results of which we already see in the abandonment, to a great extent, of their late narrow rules and formulæ of design. This new era has already been elegantly illustrated by such buildings as the Oxford Museum and the Assize Courts at Manchester—buildings the design of which has been controlled not by archæology so much as by fundamental principles. Regarding these as types of British progress in architecture, and comparing them with the perpendicular pedantry of the new Houses of Parliament, English architects may at length fairly claim that they at least are no Philistines; that they are discovering other precedents besides English precedents, and, underlying them all, controlling them all, more important than all, a vital principle of art.

The English are instructing us in architecture to this extent. Let us continue to read their new books and watch their new works. Let us profit by their labors and their experience. But there is another field of instruction no less fertile than this, no less fruitful in ideas and examples, though far less familiar. There is an important rational movement in France on this question, into the causes and progress of which it is becoming we should examine with scrupulous care, and which we shall discuss in our next number.

A NEW PHILOSOPHICAL LIGHT.*

The author of the work which bears this portentous title-page informs us that he allows to the world three hundred years rightly to judge and fully to appreciate the value of the doctrines which his book contains. Ih order that the time may be accurately reckoned, he has recorded the date of the issue of the first edition as April 5, 1865. It would have been easier to keep the reckoning if it had been April 1, but four or five days are of little account where the period is so long as three hundred years. One year has expired already. It is somewhat early for a book destined to so long a probation to come under the notice of the reviewer; but we venture to introduce it to the public in a critical way, premising that if our estimate should prove to be incorrect because it is premature, there is ample time for it to be corrected and reversed.

The "Philosophy of the Human Voice," published by the same author in 1827, must have been received with unexpected favor, for he tells us that he gave the world fifty years to become duly sensible of its value. It has become a classic in its way, and has done more than any work of the century to lay a solid foundation for the science and art of elocution, and for an analysis of the products of the human voice. Though pedantic in its nomenclature and positive in its tone, it gives evidence that the author was gifted with a discriminating ear, and that he had applied to all the possible modes of human speech a most careful and patient attention.

The analysis of the human intellect was undertaken much earlier, and has been much longer upon his hands. The promise is very large upon the title-page, to which, however, the performance by no means corresponds. The reason is to be found not in any defect of the power of analysis, but in a defect of method arising from a false fundamental assumption. The *idolon specûs*, which has misled a mind naturally acute and trained under no inferior opportunities, is the notion that the mind must be material in its structure, and can be studied only by the methods that are appropriate to the inspection and analysis of things that can be seen and touched. The "metaphysician" against whose "confusions," "arrangements," and "nomenclature" he enters so earnest and vigorous a protest upon the title-page, is any one who believes in a spiritual essence which is separate from the body and brain of the animal. The author is not content with renouncing the metaphysician and "all his works" by a single emphatic disavowal, but he returns to him on almost every page, as if the lustiest belaboring of the poor unfortunate with blows and kicks of every device could never satisfy his indignant zeal. The only legitimate method of investigating the mind, in the view of the author, is "the physical" as contrasted with the metaphysical. By the physical he does not intend the inductive method as contrasted with the speculative, nor the analytic as distinguished from the fantastic; he does not mean the docile and patient seeking after the facts and laws of the soul, as a constituent part of that great system of physics which we call nature, but he means the assumption, by a kind of dogmatic *coup de main*, that the substance of the soul is itself material. The first proposition which the author lays down is the following: "The human mind is an effect of the organization of the senses and the brain. This mental function is governed by laws similar to those of other physical phenomena." The only evidence which he condescends to furnish is in a few sentences like these: "In this beginning of the history of the material mind, we refer its effects solely to the physical laws of nature. These, as far as we can perceive, produce all their phenomena by the relationships or actions and reactions of matter alone, without the agency of what we call spirit. These laws, *we maintain from analogy*, operating on the senses and the brain also produce the mind in common with their other material effects." "Could a controversial metaphysician bring before *my senses the smallest fraction of the least atom* of an immaterial mind, I might be induced to try an argument about the rest of its atomism," etc. The senses are the only instruments by which we obtain any knowledge of mental phenomena. The suggestion that there may possibly be another means of knowing the soul called consciousness, he rejects as a fiction of metaphysicians, and he accounts for the invention of it by

* "Brief Outline of an Analysis of the Human Intellect: intended to rectify the scholastic and vulgar perversions of the natural purpose and method of thinking, by rejecting altogether the theoretic confusion, the unmeaning arrangement, and indefinite nomenclature of the metaphysician. In two volumes. By James Rush, M.D., author of the 'Philosophy of the Human Voice' and of 'Hamlet,' a dramatic prelude in five acts." Philadelphia: J. B. Lippincott & Co. First edition. April 5, 1865.

supposing that "the enquirer who first turned his attention to the state and action of his own mind and to the effects of mind in others, noticed in himself an act of memory and a comparison of two acts of memory, to which notice he gave the name 'consciousness,' and learned by description that there is the like exercise of consciousness in others. And thus arose the general term for our self-knowledge of part of the phenomena of the mind." "The want of an analytic observation induced a belief of there being something in its condition different in kind from the physical perception of external objects."

When the author comes to those acts in which the organs of sense have no direct share, viz., to the impressions of sense received by memory, he seems to have some faint impression that his theory will fail, but he marches bravely up to the threatened breach with the following argument: The "memorial perceptions" are "perceptions without the presence of their external causative objects." But how can they be material in their character if one of the material co-factors is withdrawn? "*From an analogy that cannot be controverted,* we infer that the memorial perceptions are excited upon some delicate but *un*obvious organization of the brain; and having regarded the primary as physical functions, *we must infer with strong probability* from the homogeneous structure of the sensuous nerves and the brain, and from the correspondence of the images and types with their external things, excepting a fainter degree of the memorial, that, *until the contrary is proved, the memorial* are equally a material process," etc. It will be seen that the conclusion is founded upon analogies piled upon analogies, and that the author rests serenely upon its truth until "*the contrary is proved.*" The contrary, if proved, would be that the phenomena in question are not discernible by the senses. How this can be effected to a mind which denies that anything can be real which is not "discerned by the senses" it is somewhat difficult to conjecture.

The author having surmounted this difficulty, pursues his way bravely on. He disposes of all the phenomena usually called relational under the category of "joint perceptions;" the phenomena of reasoning are assigned to "the conclusive perceptions;" the effect of language is ascribed to "the verbal perceptions;" "the primary," "the memorial," "the joint," "the conclusive," and "the verbal," being made to comprehend all the phenomena of the soul. It is singular to notice how easily he glides over the difficult points of his theory by the help of a word, how he recognizes all the variety of relations in which the perceptions stand to one another when they are joined in the brain, and yet how quietly he asserts that they are all accounted for by the mere fact that the "perceptions" concerned are excited in the brain, as purely material phenomena, at the same instant. It would be an interesting question for him to answer, "How is it that the perceptions concerned are at one moment judged as diverse, or identical as whole and part, as here and there, as near and remote, as substance and attribute, as cause and effect, as means and end?" What special twist, oscillation, vibration of fibres or fibrillæ, or other *un*obvious sensuous changes in the brain, can be conjectured as giving—no, not as giving or being the condition of, but as being themselves the knowledges of—any of these relations? Dr. Rush seems not to desire to evade this question. He recognizes all these relations as actually involved in our "joint perceptions." He dwells upon the necessity of them all in the system of human knowledge, and illustrates their application in forms that are manifold. But he does not flinch in the least from the conclusion to which his assumptions lead him. He boldly affirms "that relationships, when recognized by the senses and the brain, are as truly physical as the things themselves which give rise to them." Surely it would seem that a man in the spirit of a system could go no further than this. But our author seems to proceed to a point beyond. He looks forward with hope to the time when the capacities of light may be so far understood, and the resources of the microscope may be so far developed, as to "render the most delicate structure of the brain and its hidden movements palpable to every enquiry into the physical problem of the human mind." "We leave it to the future discoverers of an enlarged and piercing method of vision, and to the observing, experimenting, and reflective physiologists, not to dodge among cerebral fibres and cells after an invisible and trackless spirit, but to trace and describe the physical forms, motions, successions, and combinations of images and types in the working plan of the brain, thus spreading over the mind a descriptive panorama of its material self." We own that this is something novel, and that it will probably require a portion of the assigned three hundred years to effect this result. The boldness, not to say the audacity, of the proposition is only equalled by the sublime unconsciousness of the author of the irony upon himself contained in the concluding clause: "thus spreading over the mind a descriptive panorama of its material self." What is a "material self," in the theory of the author, but a material organism of the contents of a few cubic inches capable of oscillations or other *un*obvious but presumed sensible affections which, it is conjectured, may in some good time be discerned by the microscope? What possible "descriptive panorama" could there be, except a pictorial representation (enlarged and photographed, perhaps) of these sensuous movements microscopically discerned? But how this representation could be "spread over" the mind it is not at all easy to see, if the mind is but a material self, *i. e.*, an oscillating or throbbing brain. How can you spread upon such a brain a pictorial representation of itself? If the physical philosopher would be so good as to do this, and prove it to our senses, we will renounce the demonstrations of metaphysics for ever. We will, at the end of the first year of the three hundred, accept Dr. Rush as our philosopher and guide.

It is a curious question how came Dr. Rush to adopt the theory which he propounds. We can find no better solution of this question than one which his own theory suggests. In giving the history of the composition of his treatise, he says that the first drafts were written in pencil in "the Nassau Hall position" acquired at Princeton College, where he "learned the common practice there of reading and studying with the feet elevated to the height of a table, a fire-place ledge, or window-shelf, or anything to keep the feet from the floor." This was not "a boorish American vulgarity, but a fashion of classical education." "It has been my manner, therefore, always to think, compose, and first commit to pencil record in the Nassau Hall position," etc.

We would submit the question, with all deference, whether this unfortunate habit does not, on the author's own theory, account for the theory itself. Did he not elevate his feet too high in thinking and composing, and was not the blood driven back upon the upper extremities and made to press too heavily upon the brain? Was there not in consequence induced a general subversion or turning "topsy-turvy" of the whole cerebral apparatus, and is not the theory of the author himself, as a kind of subversion or turning upside down of all the usually received notions, fully accounted for by the unfortunate "Nassau Hall position" carried to excess? It is a pity that science was not in a condition to penetrate into the interior of his brain when this attitude was assumed. The results of a microscopic diagnosis might not only have confirmed the truth of the theory itself, but have gone far towards explaining its origin.

SOUTHERN UNIONISM.*

This book, written by a Northern woman living in the South among the scenes she describes, is published for the purpose of giving facts to show the uncompromising and devoted character of the loyalty of those Southerners who remained true to the country during the war. The truth of the incidents is vouched for, and the characters are drawn from life; the form of a connected story has been chosen to attract and heighten the interest. The facts of themselves—the hunt of Union men with bloodhounds; the refuge in the swamps; the Union speech by Richard Whedden in the secession court-house, ending in his attempted murder, the fight of the hostile parties, and the fall of the crowded court-house floor; Richard Whedden's escape; the heroine's imprisonment and discovery of her lover in a Yankee prisoner; Annie McGowan's revenge, and the fall of Newbern—were events exciting enough to have made the story interesting, if the manner of telling had not rendered them tame. The style varies from an unnatural exaltation to an unnatural depression—often putting a stilted diction in the mouths of persons whose words are meant to move the feelings, not dwelling with sufficient emphasis on the prominent and effective scenes. We mention this in no unnecessarily critical spirit, but as an explanation of the reasons which will prevent the book from attaining that popularity which the author no doubt considered the subject entitled to. Had the treatment been more successful, had the result been more readable, these sufferings of Southern Unionists would have got a larger number of attentive listeners.

There is another reason, however, why the "Eye-witness" fails in a measure of its object, the proof of error in the prevailing opinion at the North, that there is but little Union feeling at the South, and that of rather an equivocal character. The existence at the beginning of the rebellion of a strong Southern party for the Union few people doubt, any more than they do the withdrawal of at least one or two States by mere political trickery; that there was a great deal of stout loyalty in North Carolina during the first year of the war, every one is willing to believe, and will believe more firmly after reading this narrative; but the volume closes with the occupation of the coast by Burnside, while we are chiefly anxious to know the condition of feeling in the State after rather than before his landing. How

* "Eye-Witness; or, Life Scenes in the Old North State, depicting the trials and sufferings of the Unionists during the Rebellion. By A. O. W." Boston: B. B. Russell & Co.; S. S. Boyden, Chicago, Ill. 1865. 12mo, pp. 276.

many Unionists there were during the last three years of fighting, how many were content to remain in the swamps and sacrifice all personal considerations to their love of country when the Confederate power had tightened its grasp, is the information which we should most desire, and it was this information that the author, from the circumstances of the case, could not give. The prevailing opinion at the North is that, as it was natural to expect, when the Confederate authority was fairly established, when the Union began to seem an impossibility, when life and limb were threatened on every side, Southerners began to look upon submission to the powers that were as their only resource, and that, having once come to that point, the loss of brothers, sons, and slaves was sufficient to make the greater part hate the government they wished to love. The frequent reference now in Southern news to the political antecedents of prominent men, who were originally opposed to secession, but afterwards supported it, may show to some extent the truth of this view. We should be glad, indeed, to know otherwise—to have accurate proof that in the summer of 1864, for instance, there was any considerable Union feeling in the rebellious States east of the Mississippi.

But this doubt does not make any less real the heroic fortitude and terrible trials that this eye-witness saw. Northern men and women can have nothing but deep sympathy for those in the South who risked everything to be faithful under the lash of the faithless. They knew war in all its horrors, not in battle, but at home, robbing, persecuting, and killing them at their very doors; they had nowhere to fly, save with snakes to the swamps, or foxes to the mountains; nowhere even to die for their cause unless they rotted in prison, or swung from gallows; they were alone in the midst of their friends, their own kin were their enemies. Yet they hoped and struggled on, where there seemed nothing but despair. If any one doubts this, or has forgotten, let him read the "Eye-witness."

Science.

SCIENTIFIC NOTES.

THE description of a "Process of Fractional Condensation, applicable to the separation of bodies having small differences between their boiling points," by Mr. C. M. Warren, which was published in this country some months since, in the *American Journal of Science* and elsewhere, is now going the rounds of the European scientific journals. In view of the facts that this process has attracted so much attention abroad, and that it promises to be of great value as a means of scientific research, and perhaps even of direct practical utility in the arts, it deserves to be more generally known to the American public than now appears to be the case. The apparatus employed by Mr. Warren differs from the ordinary distillatory apparatus only in that, between the retort and the condenser, there is inserted an inverted worm. This inverted worm is immersed in a bath of water, or oil, or some fusible metal, so arranged that it can easily be maintained at any desired temperature by means of a special lamp or fire. So long as this bath is kept cold, no vapor can pass through the worm which is immersed in it. Thus, for example, if a mixture of alcohol and water were to be boiled in the retort the vapor would all be condensed in the cold inverted worm, and run back as a liquid to the retort. But when the bath which contains the inverted worm is heated, it is found that vapors can pass through this worm at a temperature which is considerably lower than that at which the mixture in the retort is boiling. Now, since the temperature of the bath is completely under control, it can readily be maintained at such a point that the vapors arising from the retort shall be cooled to the lowest possible limit of temperature which their most volatile portion can bear without suffering condensation. This temperature having first been hit upon by trial, the bath is then regulated so that only a certain small and tolerably definite portion of the vapor shall pass through the inverted worm, the greater part of the vapor which enters the worm being condensed within it and so returned to the retort. In order that the translation of the volatile portion of the vapor shall be continuous, it is only necessary that the temperature of the bath be increased very gradually as fast as the more volatile constituents of the mixture in the retort are taken off; this is easily effected by trimming the flame beneath the bath. It is evident, from the foregoing, that by means of the new process there can be secured, regularly and constantly, a vastly more efficient condensation and separation of the more volatile from the less volatile portions of any vapor than has ever been realized in any of the old processes of fractional distillation. The vapors which have passed through the inverted worm are, of course, led into an ordinary cold condenser, where they are reduced to the liquid state and collected in small successive portions. In this way there is obtained a series of products as pure as can possibly be afforded by a single distillation, and by again repeatedly subjecting these products to the sifting action of the warm inverted worm almost absolutely pure products can be at last obtained.

—The study of the habits of the tape-worm reveals the history of a large number of parasites which infest both man and animals, and sets forth in a clear light the dependence, in certain cases, of one species of animal upon another, of a wholly different kind, for the fostering of its young. To effect this it becomes necessary that the young parasite should perform a series of migrations, the accomplishment of which, under the circumstances, would seem, were it not for the positive evidence to the contrary, a matter of impossibility. A species of tape-worm which infests the intestines of the herons and other shore birds discharges its eggs within the intestine. These are voided by the bird, fall into the water, and are swallowed by the sticklebacks, in whose digestive organs they hatch. The young, however, do not remain here, but, obeying their instinct, bore through the intestinal walls and find their way into the general cavity of the abdomen. Here they grow often, relatively, to an enormous size, but do not reach maturity. So long as the parasite lives in the body of the cold-blooded fish the sexual organs do not appear, and will not, until the host, the stickleback, is swallowed by some water-bird, in whose stomach the fish is digested, and the young tape-worm thus set free. Under the influence of the warmer climate of the bird's body sexual maturity is reached, and the animal is in a condition to lay eggs and thus give birth to a new generation.

The migration of the human tape-worms (there are two species) is not unlike that which has just been described. These worms only become sexually mature in the intestines of man. Each of the joints, which together make up the body of the worm after it has acquired its full size, has both male and female organs, and, as regards the process of reproduction, each joint may be considered a complete animal. There may be several hundred such joints, each producing thousands of eggs. The mature joints detach themselves from the main body, and may lay their eggs either before or after leaving the intestines of their host. Once out of the human body all further development is at an end, and they inevitably perish unless they are swallowed by some other animal. Of such as are used for food by man, the hog is almost the only one into whose stomach they are carried; but for one egg that reaches this destination, hundreds of thousands, perhaps millions, fail. A single joint of a tape-worm, however, contains eggs enough to infest the whole body of the hog. Almost as soon as swallowed, the young parasites are set free by the action of the gastric juice in the hog's stomach. The action of this juice is necessary, since the covering of the egg has such a consistency that the young worm unaided cannot make its way through it. It is on this account that the eggs do not hatch in the intestines, since the fluids of the intestines have no solvent power upon the envelope. As soon as freed the young begin their migration anew, bore through the intestinal walls, and by traversing the tissues or by getting into the vessels, along which they are carried by the blood, they finally reach the muscles, where they for the most part stop. Sometimes, but rarely, they reach the membranes of the brain. The young worm now begins to grow, and develops from its hinder part a sac filled with water, which gave rise to the name of cysticercus or "bladder-worm." When present in large numbers at this stage in hogs' meat they cause the appearance commonly known as "measly pork." In this condition they are sexless, and are also powerless to migrate further and seek the other conditions necessary for their full development

To obtain this development, they must in some way be carried back from the hogs' muscles to man's intestines. If the flesh of the hog is eaten without the parasite having been killed by cooking, which often happens, the circuit is completed and the migration ended. The worm now casts off its bladder, buries its head in the mucous membrane, makes it fast with its crown of hooks, and begins to develop joints and assume the mature condition. Thus it will be seen that the eggs pass from man, are swallowed by the hog, hatch in his stomach, the young migrate to his muscles, and thence pass in food to man's intestines. The adult belongs to man, the "bladder-worm," or the cysticercal stage, to the hog.

Contrary to what has just been stated, the cysticercus has been found, in rare instances, in the human body. This anomaly has been accounted for by supposing that either the eggs have been accidentally swallowed, or as really happened in one case, after obstinate vomiting, they were carried up from the intestine into the stomach, where the young were liberated by the gastric juice, and thence migrated to the muscles as they do in the hog. A cysticercus in the human muscles could never come to maturity unless the infested person were eaten by some animal or by chance fell into the hands of cannibals.

Of all migrating parasites infesting the human body the trichina spiralis is the most formidable, not only on account of their immense numbers, but of the serious and often fatal effects of their march. This pest has been known for thirty years, but it is only quite recently that it has been proved to be the cause of grave disease. In Germany several instances have happened where large numbers of persons have been infected, and of the infected many have died, in some communities giving rise to a general panic. At Hedersleben, in Saxony, a town of two thousand inhabitants, three hundred persons were attacked, and of these it was estimated that about one hundred died.

The worm is of microscopic size, not exceeding the one-fiftieth of an inch in length, and sometimes exists in incredible numbers. Middeldorpf has invented an instrument for extracting portions of muscles in suspected cases, and in some instances a piece of muscle could not be found in any part of the body which did not contain trichinæ. Any one who has seen a piece of infected flesh will not be disposed to doubt that they may fairly be estimated by millions.

The history of the trichinæ has been carefully studied by Leukart and Virchow. In the mature stage their habitat is in the intestinal canal of man and some of the domesticated animals; in the immature or sexless stage, except when migrating, they are confined to the muscular system, and alternate between the intestines of one animal and the muscles of the other. As far as man is concerned, he alternates mostly with the hog in helping to maintain the life of this formidable parasite, though it is probable that in some instances he shares the same responsibility with the rabbit. To follow the worms through their circuit we will suppose a man eats trichinous pork; as soon as the parasites reach the intestines they begin to develop sexual organs, each female worm laying about one hundred eggs; a single ounce of pork has been known to contain thousands of trichinæ, and these, collectively, produce eggs enough to infect the whole body. When the eggs are hatched, the young, under the influence of their migratory instinct, perforate the intestines and disperse in every direction, following the interstices of the organs until they reach the muscular system; here they stop, and soon become invested with a membranous sac, which in course of time may become solidified by a deposit of lime in its substance. This period of their emigration from the intestinal canal is the dangerous one for man. If there are a few only, their presence may not be known; but when they move, as is more commonly the case, in large numbers, the progress of thousands of them eating their way at the same time, in all directions, through the tissues, gives rise to febrile symptoms, intense pain with great tenderness of the abdomen, great prostration and a general typhoid condition, all of which may end in death. If the victim survive this, there is another stage which, though less grave, is seriously troublesome, viz.: that in which the worms establish themselves in the muscles, giving rise to great soreness all over the body, every motion being attended with tormenting pain. This, however, gradually passes away, and the patient recovers, though his body is everywhere filled with the chalky cysts containing the parasites, which sooner or later perish. For here, as in the case of the cysticercus, the only chance for them to come to maturity is in man's being devoured by some animal or by his fellow-man.

From what has been stated it will be seen that the man and the hog play an important part in the life of both the trichinæ and the tape-worm, and it cannot be denied that the flesh of the hog may become a highly dangerous article of food. Fortunately in this country the trichinæ has thus far proved comparatively rare, since the custom of eating uncooked ham or sausages is much less common with us than in the Old World; nevertheless some instances of fatal poisoning by this parasite have occurred, and many other cases have been observed of a less severe character. The only security man can have against the trichinæ is either to abstain from eating the flesh of the hog, or, if he will have it, to make sure that it is thoroughly cooked, in which case the trichinæ will be inevitably killed.

NEW AMERICAN AND FOREIGN BOOKS

PUBLISHED AND FOR SALE BY

J. B. LIPPINCOTT & CO., Philadelphia.

LIPPINCOTT'S PRONOUNCING GAZETTEER OF THE WORLD. Revised edition, containing ten thousand new notices. Edited by J. Thomas, M.D., and T. Baldwin. In one imperial octavo volume. Price $10.

LIPPINCOTT'S PRONOUNCING GAZETTEER GIVES—

I. A Descriptive Notice of the Countries, Islands, Rivers, Mountains, Cities, Towns, etc., in every part of the Globe, with the most recent and authentic information.

II. The Names of all Important Places, etc., both in their Native and Foreign Languages, with the Pronunciation of the same—a feature never attempted in any other work.

III. The Classical Names of all Ancient Places so far as they can be accurately ascertained from the best Authorities.

IV. A Complete Etymological Vocabulary of Geographical Names.

V. An Elaborate Introduction explanatory of the Principles of Pronunciation of Names in the Danish, Dutch, French, German, Greek, Hungarian, Italian, Norwegian, Polish, Portuguese, Russian, Spanish, Swedish, and Welsh Languages.

THE DAILY PUBLIC SCHOOLS IN THE UNITED STATES. 1 vol. 8vo. $1 50.

"No man goeth about a more godly purpose than he that is mindful of a good bringing up, both of his own and other men's children."—*Socrates.*

"I sometimes am tempted to doubt whether any one who tries to open people's eyes in science, politics, or religion is to be reckoned as a sublime martyr or an egregious fool."—*Robertson's Life and Letters.*

ECCE HOMO. A Survey of the Life and Work of Jesus Christ. 1 vol. 8vo. Nearly ready.

THE SONG BOOK. Words and Tunes from the best Poets and Musicians. Selected and arranged by John Hullah, Professor of Vocal Music, King's College, London. 18mo, $2 25.

THE POEMS OF ROBERT BURNS. Edited, with a Prefatory Memoir, by Alexander Smith. 2 vols. 18mo, $1 50.

THE REPUBLIC OF PLATO. Translated into English, with an Analysis and Notes. By David James Vaughn, M.A., and John Llewelyn Davies, M.A., late Fellows of Trinity College, Cambridge. 18mo, $2 25.

MOSAICS OF LIFE. Illustrative of the various Epochs of Human Life—Betrothal, Wedded Life, Babyhood, Youth, Single Life, Old Age. By Mrs. Elizabeth A. Thurston. 12mo, $2.

JEHOVAH JIREH. A Treatise on Providence. By William S. Plummer, D.D., LL.D. 12mo, $1 50.

THE STUDENT'S PRACTICAL CHEMISTRY. A Text-Book for Colleges and Schools, on Chemical Physics, including Heat, Light, and Electricity, and on Inorganic and Organic Chemistry. By Henry Morton, A.M., and Albert H. Leeds, A.M., Professors in the Franklin Institute. Cloth, $2.

DIARRHÆA AND CHOLERA. Their Origin, Proximate Cause, and Cure through the Agency of the Nervous System, by means of Ice. By John Chapman, M.D., M.R.C.P., M.R.C.S. Pamphlet, 25 cents.

THE STORY OF GISLI, THE OUTLAW. From the Icelandic. By George Webbe Dasent, D.C.L. With illustrations by C. E. St. John Mildmay. 1 vol. small 4to. With maps and beautiful full page illustrations. The "Story of Gisli, the Outlaw," is one of the choicest gems of Icelandic legendery lore. The volume is executed in the highest style of the art of book-making. $3 50.

CERISE: A TALE OF THE LAST CENTURY. By G. J. Whyte Melville, author of "The Gladiator," "Digby Grand," "The Brokers of Bridlemere," etc. 1 vol. 12mo, $1 75.

A REBEL WAR CLERK'S DIARY AT THE CONFEDERATE STATES CAPITAL, during the entire four years of the existence of the Confederate Government. By J. B. Jones, Clerk in the War Department of the Government of the Confederate States. In 2 vols. crown 8vo, $5 50.

MEDICAL ELECTRICITY. Embracing Electro-Physiology and Electricity as a Therapeutic. With special reference to Practical Medicine, showing the most Approved Apparatus, Methods and Rules for the Medical Uses of Electricity in the Treatment of Nervous Diseases. By Alfred C. Garrett, M.D., Fellow of the Mass. Medical Society, etc., etc. Third edition, revised and illustrated. 1 vol. 8vo, $6.

LIFE OF EMANUEL SWEDENBORG. Together with a brief Synopsis of his Writings, both Philosophical and Theological. By William White. First American edition, with an Introduction by Rev. B. F. Barrett. 1 vol. 12mo, $1 50.

COMPARATIVE ANATOMY AND PHYSIOLOGY OF THE VERTEBRATE ANIMALS. By Richard Owen, F.R.S., D.C.L. In three volumes. This work will be illustrated by upwards of 1,200 engravings on wood. Vol. I. nearly ready.

GLOBE EDITION OF SHAKESPEARE'S WORKS. Complete. 1 cap 8vo. volume, including the

PLAYS, POEMS, SONNETS, and a COMPLETE GLOSSARY. Edited by William George Clark and William Aldis Wright, of Trinity College, Cambridge. $2 50.

THE HISTORY OF USURY, from the earliest period to the present time, together with a brief statement of general principles concerning the conflict of the laws in different States and Countries, and an examination into the policy of Laws on Usury, and their effect on commerce. By J. B. C. Murray. 1 vol. 8vo.

WILSON'S PRE-HISTORIC MAN. Researches into the Origin of Civilization in the Old and New World. By Daniel Wilson, LL.D., Professor of History and English Literature in University College, Toronto, author of the "Pre-Historic Annals of Scotland," etc. 2d edition. 8vo., cloth. $10.

NEW BOOKS.

Just Published,

ST. MARTIN'S SUMMER.

By ANNE H. M. BREWSTER,

Author of "Compensation," etc. One vol. 16mo, $2 25.

"'St. Martin's Summer' is the journal of a residence in Italy, and of a voyage through the Mediterranean. It is more concerned, however, with inner experiences than outward observation. Instead of feelings and emotions described at secondhand, the anatomist of the human heart is presented with some new secrets of that mysterious inner world, while the artist gets fresh glimpses of the might of music, painting, and architecture, as interpreters of thoughts which the tongue is powerless to convey. The sights and sounds encountered, the love-making of certain young people in the party, various rides in the country—in short, all little incidents which fall out in daily life, serve but to suggest some original reflection, or to recall some apt utterance of the masters of literature. The account of life in Naples—the life of the refined and cultivated—is excellent from first to last. . . . Another pleasant feature in this book is the charming manner in which the birth and growth of first love in a youthful maiden's heart of hearts are here duly chronicled."—*Philadelphia Press.*

GEOLOGICAL SKETCHES.

By L. AGASSIZ.

With Fine Portrait and numerous Illustrations.

One vol. 16mo, $2 25.

CONTENTS.

America the Old World.
The Silurian Beach.
The Fern Forests of the Carboniferous Period.
Mountains and their Origin.
The Growth of Continents.
The Geological Middle Age.
The Tertiary Age and its Characteristic Animals.
The Formation of Glaciers.
Internal Structure and Progression of Glaciers.
External Appearance of Glaciers.

The three concluding chapters on Glaciers are introduced with special reference to their geological significance, and they naturally lead to a discussion of all the facts connected with the ice period; the erratic boulders, the drift, the formation of river systems, ancient lake and river terraces—all the phenomena, in short, resulting from the former presence of such immense masses of ice and their subsequent disappearance, which present quite a different aspect here from what they do in the Old World, owing to the extensive land surfaces on this continent.

This volume discusses, in a popular and attractive manner, yet with thorough scientific accuracy, some of the most interesting questions in Geology.

Either of these books sent post-paid on receipt of price.

PHILIP FRENEAU'S POEMS

RELATING TO THE

AMERICAN REVOLUTION.

With Notes and an Introductory Memoir.

BY EVERT A. DUYCKINCK,

Author of "Cyclopædia of American Literature."

This collection embraces all of Freneau's Poems relating to the American Revolution, gathered from the several volumes published by the author. No collection of this kind has appeared since the edition, now exceedingly rare, published at Philadelphia in 1809. The Poems of the Revolution, by which the author's reputation was established, are now brought together in one volume for the first time.

A handsome crown 8vo volume, with Steel Portrait and a Fac-Simile Poem.

Price $2 25.

"Mr. Duyckinck has done excellent historical as well as literary service, by collecting and annotating Freneau's 'Poems of the Revolution;' they are significant and authentic illustrations of the war, the state of society, and the political spirit of our ancestors. They were read and admired by heroes and patriots. Freneau's verses have been commended by Scott and Southey, and Campbell borrowed a striking image therefrom. 'The Prison Ship,' in this handsome volume, is a true and harrowing picture of the sufferings of our early patriots, only equalled by the annals of the 'Libby' and Andersonville."—*N. Y. Evening Post.*

FINANCIAL REVIEW.

Nation Office, Saturday Evening, March 31, 1866.

The feature of the week has been a decline in exchange to 106 for prime mercantile and 106¼ to 106⅜ for first-class bankers' bills. The decline was caused by the excess of cotton bills offered for sale, combined with the reduced enquiry from importers. Goods are so hard of sale that importers are generally unable to remit; while, on the other hand, the existing firmness of the cotton market abroad, and the uncertainties impending over its future, induce continued shipments to Europe in spite of falling exchange. Simultaneously with this remarkable turn in our foreign exchanges, the gold market has once more been "cornered." A clique of bold and wealthy operators, relying upon the implied promise of Government to sell no more gold before the May interest falls due, have bought up some four to five millions, and locked it up, thus creating an artificial scarcity and compelling the bears either to pay ⅛ or ¼ of 1 per cent. for the use of gold for a day, or to cover their contracts. Under these influences the price was forced up at one time this week to 128½. It closed to-day at 127¾. But for the scarcity, gold might now have been nearer 120 than 125, and there are those who believe that when the clique disgorges its gold the premium will fall lower than it would have gone had no scarcity been created—perhaps below 120. It is an open question among bankers whether or no it will pay to import gold at the present time. In ordinary times, when this country was on a specie basis, it was usually calculated that with bankers' bills at 106½, gold could be imported from London. Just now, however, to make the operation safe, the gold must be sold "short" here the day the exchange is bought and borrowed for the interval to elapse before it can be got from the other side, the sovereigns sent to Philadelphia to be recoined into eagles, and thence returned here. If during this interval gold should be worth ⅛ or even 1-16 a day, the operation would be a losing one. Still, it is likely that some device will be discovered for surmounting this difficulty, and that in the event of a continued depression in the exchange market some parcels of gold will

come from the other side. London bankers will not be slow to discover the profit to be made by sending gold here to be invested in cotton bills.

General business continues depressed, especially in the dry goods trade. Staple and fancy goods, in the auction rooms, do not sell for as much in currency as they cost in gold. Some descriptions do not command enough to pay the duty. A slight improvement is reported in some styles of domestics, but not enough to restore confidence among manufacturers or to put jobbers in spirits again. Buyers are few in number and very cautious in purchasing. Not even the triumph of Mr. Stevens and the paper-money men in Congress suffices to shake the general belief that prices are on the downward turn, and that the less a man buys the better he will be off.

Money is very easy. Call loans are 5 to 6 per cent. First-class short paper is quoted at 7; long paper is not easy of sale. It was rumored some time since that the interest on the temporary deposits in the Sub-Treasury would, on 1st April, be reduced to 5 per cent. No such announcement has yet been made. A heavy failure took place last week in banking circles: Culver, Penn & Co., a house connected with petroleum wells, suspended payment on Wednesday. It is understood that the house had locked up all its available means in building a railroad in the oil region. It is feared that other failures will be likely to follow. During the expansion of the past three years many institutions and firms must necessarily have extended themselves to a degree which may involve danger in the event of continued contraction. With the exception of Governments and the active speculative stocks of the day, there is but a limited market for securities, and a still more limited one for merchandise. Forced liquidation would involve losses which might lead to many suspensions. Prudence dictates the policy of contracting business of all kinds, and allowing no obligations to run which can be extinguished. Those only will grow rich in these days who keep out of debt, live economically, and buy no more than they want from day to day.

The following table will show the course of the stock, gold, exchange, and money markets throughout the week:

	March 24.	March 31.	Advance.	Decline.
United States Sixes of 1881	104⅞	105	⅛	....
5-20 Bonds, old	103⅞	104⅛	⅜	...
5-20 Bonds of 1865	103¾	104⅛	⅜	....
10-40 Bonds	90⅝	92⅜	1¾	....
7.30 Notes, second series	100	100⅜	⅜	....
New York Central	92¾	90⅝	....	2⅛
Erie Railway	80⅜	74⅜	....	6
Hudson River	109	108	....	1
Reading Railroad	101⅜	99⅛	....	2¼
Michigan Southern	81½	83½	2	....
Cleveland and Pittsburgh	79¾	76¾	....	3
Chicago and North-western	27½	26½	....	⅞
" " " Preferred	55⅝	54¼	....	1⅜
Chicago and Rock Island	116	111¼	....	4¾
P., Fort Wayne, and Chicago	92	88¾ ex. d.	....	3¼
Canton	47	47	....	....
Cumberland	44¼	43	....	1¼
Mariposa	12	11⅜	....	⅝
American Gold	125	127¾	2¾	....
Bankers' Bills on London	107¾	107	....	¾
Call Loans	6	6	....	....

One feature of the week has been a general though slight advance in Governments of all descriptions. These securities are in growing demand both at home and abroad. Recent advices from Germany state that as the United States currency improves and the gold price of the bonds rises, the German consumption will increase instead of declining. Dutch bankers who bought 5-20s at 35 to 40 in gold are buying again at 72 to 73, instead of realizing the profit on their previous investment. And here, at home, many persons, dreading the uncertainties of the future and disgusted by the rogueries of railway managers, are selling their railroad securities and putting the proceeds in Governments. The 10-40 bonds have been in especial demand during the week, and many seem to expect that they will gradually approximate to par.

On the railway list depression has been the rule, with one solitary exception—Michigan Southern. This stock is firmly held by the clique which has it in hand, and has sold as high as 84¼. To maintain the price in the teeth of a declining market, the clique have been compelled to buy all the stock offered, and as few speculators venture to sell it short, in the present condition of the stock, they will have a pleasant time when they propose to realize. It was rumored that the directors would declare a dividend at the meeting on the 27th. But whether the board had not the courage to do so in view of the fact that the company has not yet been able to repay the money it borrowed of Mr. Henry Keep for the dividend of March, 1865, or whether a majority of the board are not interested in the present clique movement, the meeting adjourned without fulfilling the predictions of speculators. There is every reason to believe that the company is earning little or nothing over and above expenses and interest. But the clique may, nevertheless, put up the price to 90 or 100 if the bears sell the stock short. The famous Rock Island clique, disgusted by the declaration of a dividend of 5 per cent. only, tried to sell their stock on the 28th inst., and in about an hour the price ran down from 116 to 110¼. Had the clique continued to press stock upon the market the price would have gone to par before the adjournment. Alarmed by the utter absence of enquiry for the property, they stopped selling, and enjoined the directors against the declaration of so small a dividend. This legal proceeding will, of course, prove a farce. The Erie director has at length shown his hand, and has sold down the stock to 74½, against 85 three weeks ago. His losses in the recent campaign must have been excessive; it remains to be seen whether he can make them up on the bear side. His friends predict that the stock will sell at 60 before midsummer. New York Central shows signs of weakness, the Albany bill being by no means what the company wanted. There is a heavy block of this stock to be sold when the fate of the measure is finally determined. As a general rule, the public continue to be entirely indifferent to the fluctuations in railway shares. No one is buying, and, from present appearances, prices will have to decline much more before a consumptive demand arises.

Insurance Scrip.

WILLIAM C. GILMAN,

46 PINE STREET, NEW YORK,

BUYS AND SELLS INSURANCE SCRIP.

The Nation:

A Weekly Journal of Politics, Literature, Science, and Art.

THIS journal will not be the organ of any party, sect, or body. It will, on the contrary, make an earnest effort to bring to the discussion of political and social questions a really critical spirit, and to wage war upon the vices of violence, exaggeration and misrepresentation by which so much of the political writing of the day is marred.

The criticism of books and works of art will form one of its most prominent features: and pains will be taken to have this task performed in every case by writers possessing special qualifications for it.

It is intended, in the interest of investors, as well as of the public generally, to have questions of trade and finance treated every week by a writer whose position and character will give his articles an exceptional value, and render them a safe and trustworthy guide.

A special correspondent, who has been selected for his work with care, is pursuing a journey through the South. His letters appear every week, and he is charged with the duty of simply reporting what he sees and hears, leaving the public as far as possible to draw its own inferences.

TERMS:—Six Dollars per annum, in advance; Six months, Four Dollars. When delivered by Carrier in New York or Brooklyn, Fifty Cents additional.

JOSEPH H. RICHARDS,
PUBLISHER,
130 Nassau Street, N. Y.

New York, January 1, 1866.

THE BEST SEWING-MACHINES IN THE WORLD.

THE WEED MACHINES,

With all their valuable improvements, entirely overcome all imperfections. They are superior to all others for family and manufacturing purposes, simple in construction, durable in all their parts, and readily understood. They have certainty of stitch on all kinds of fabrics, and are adapted to a wide range of work without change or adjustment, using all kinds of thread. Will hem, fell, bind, gather, braid, tuck, quilt, cord, and, in fact, do all kinds of work required by families or manufacturers. We invite all persons in search of an instrument to execute any kind of sewing now done by machinery to inspect them, and recommend all parties engaging in the sale of sewing-machines to make sure they secure the best by examining the WEED before purchasing. They make the shuttle-stitch, which cannot be excelled for firmness, elasticity, durability, and elegance of finish. They have received the highest premiums in every instance where they have been exhibited in competition with other standard machines. The company being duly licensed, the machines are protected against infringements or litigation.

Reliable agents wanted, to whom we offer great inducements. Every explanation will be cheerfully given to all, whether they wish to purchase or not. Descriptive circulars, together with specimens of their work, will be furnished to all who desire them by mail or otherwise.

WEED SEWING-MACHINE CO.,
STORE, 506 BROADWAY, N. Y.

HOME FOR INVALIDS,
ESTABLISHED IN 1847,
BY E. E. DENNISTON, M.D.,
† Springdale, Northampton, Mass. Number limited to Forty.

Aware of the principles Dr. Denniston proposes conducting it upon, we are induced to recommend his establishment for the treatment of Chronic Diseases of various kinds. We believe it contains all the advantages of similar establishments, and have confidence in the skill and judgment, experience and prudence, of Dr. D. to direct the application of the various remedial treatment according to the exigencies of the individual cases.

Improvements in Piano-fortes.

One of the simplest and most truly valuable improvements yet made in the Piano-forte is that invented and patented by

DECKER BROTHERS, 91 BLEECKER STREET,

in this city. By correcting the only imperfections arising from the use of the full iron-plate, and that, too, by not detracting in the slightest degree from its many positive advantages, the Messrs. DECKER have developed in their instruments a tone at once admirable for its purity, fulness, prolongation, and sweetness, and the high estimation in which their improvement is held is well shown in the rapidly increasing business of their firm.—*Tribune.*

MARVIN'S

PATENT FIRE AND BURGLAR SAFE:

Superior to any others in the following particulars:
They are more fire-proof.
They are more burglar-proof.
They are perfectly dry.
They do not lose their fire-proof qualities by age.
Manufactured only by

MARVIN & CO., 265 Broadway.

721 Chestnut Street, Philadelphia.

Send for a descriptive Circular.

Make Your Own Soap with B. T. BABBITT'S Potash, in tin cans, 70 Washington Street, New York. Pure Concentrated Potash or Ready Soap Maker. Warranted double the strength of common Potash, and superior to any other saponifier or lye in the market. Put up in cans of one pound, two pounds, three pounds, six pounds, and twelve pounds, with full directions in English and German for making Hard and Soft Soap. One pound will make fifteen gallons of Soft Soap. No lime is required. Consumers will find this the cheapest Potash in market.

B. T. BABBITT,

64, 65, 66, 67, 68, 69, 70, 72, and 74 Washington St., N. Y.

WHEELER & WILSON'S SEWING MACHINES,

625 BROADWAY, N. Y.,

MAKE THE

LOCK-STITCH,

and rank highest on account of the elasticity, permanence, beauty, and general desirableness of the stitching, when done, and the wide range of its application.—*Report of American Institute.*

HENRY OWEN, Sole Agent.

STEINWAY & SONS'

GRAND, SQUARE, AND UPRIGHT PIANO-FORTES

Have taken Thirty-two First Premiums, Gold and Silver Medals, at the Principal Fairs held in this country within the last ten years, and in addition thereto they were awarded a First Prize Medal at the Great International Exhibition in London, 1862, in competition with 269 Pianos from all parts of the World.

That the great superiority of these instruments is now universally conceded is abundantly proven by the FACT that Messrs. Steinways' "scales, improvements, and peculiarities of construction" have been copied by the great majority of the manufacturers of both hemispheres (AS CLOSELY AS COULD BE DONE WITHOUT INFRINGEMENT OF PATENT RIGHTS) and that their instruments are used by the most eminent pianists of Europe and America, who prefer them for their own public and private use, whenever accessible.

STEINWAY & SONS direct special attention to their

PATENT AGRAFFE ARRANGEMENT,

which, having been practically tested in all their grand and highest-priced Square Pianos, and admitted to be one of the greatest improvements of modern times, will hereafter be introduced in EVERY PIANO MANUFACTURED BY THEM WITHOUT INCREASE OF COST to the purchaser, in order that ALL their patrons may reap its benefits.

STEINWAY & SONS' PIANOS are the only American instruments exported to Europe in large numbers, and used in European concert-rooms.

WAREROOMS, 71 & 73 EAST FOURTEENTH ST between Union Square and Irving Place, New York.

The Week.

THE civil rights bill has been passed in the Senate, and is, we believe at this writing, sure of being passed in the House over the veto. The New York *Times* is, as far as we know, the only one of the Republican or quasi-Republican journals which even professes to regret it. Those which were heartiest in their approval of the veto of the Freedmen's Bureau bill, confess that in the passage of the civil rights bill a great right has been done. Good faith, as Mr. Johnson in earlier and apparently better days acknowledged, demanded this much; the claims of justice as well as of decency would not have been satisfied with less. How could any Secretary of State have dared to remonstrate with any foreign power for maltreating a colored citizen of the United States, bearing the national passport, if our Government permitted the States of the Union to do the same thing not as something rare and abnormal, but under the sanction of law? When Mr. Johnson gravely argued in a state paper against giving the negroes those common rights without which it is a mockery to call a man free, on the ground that to term them "citizens" would annoy the newly arrived Irish and Germans, he destroyed what respect for his head still lingered in the public mind. There are probably few thinking men who are not now satisfied that the whole veto message would have been just as powerful, logically, as it was if it had consisted simply of the sentence—"If I know myself, I have no prejudices; but I do hate a nigger."

THE declaration wrung from Mr. Davis, of Kentucky, that, if the Freedmen's Bureau bill and civil rights bill were passed, "he was henceforth the enemy of *your* Government, and would devote the feeble remnants of his life in efforts to overthrow it," is, of course, what Capt. Marryatt called "flapdoodle." He will probably pass the "feeble remnants" of his life as he has passed the last year; but the mere fact that the feelings of such a man as Mr. Davis—a man of unusually conservative character, and who has never been guilty of any overt act of disloyalty—should prompt him to make such a speech on such an occasion, is perhaps the best proof that has been yet afforded of the wisdom of the hesitation Congress has shown in re-admitting Southern representatives. Not a man of them would be even as loyal as Mr. Davis, their oath to the contrary notwithstanding; and yet he regards the Government of the United States as not his, but a foreign government, and he vows he will pass his old age in trying to upset it. And for what? Because it has disfranchised any of its citizens? Because it taxes people without their consent? Because it quarters soldiers in private houses? Because it inflicts cruel and unusual punishments? Because it bridles the press—abolishes trial by jury—governs by proclamations—makes arbitrary arrests? None of these things. Its fault, in Mr. Davis's eyes, posterity will learn with some astonishment, is that it gives one-third of the Southern population the same rights that are enjoyed by the Irish peasantry—that is, the right of getting the same law dealt out to them in courts of justice as to everybody else, upon payment of the legal fees. We see, too, in this incident the old hatred of the rule of the majority which brought on the rebellion, and which, whenever it pervades any considerable portion of the population, eats out the vitals of a republic.

THE Connecticut election had probably much to do with strengthening Congress on the civil rights bill. But the majority was miserably small. Who would have believed two years ago that a soldier of Hawley's standing could be run so closely by one of the most prominent Copperheads of 1863?

ALEXANDER H. STEPHENS, according to the Washington correspondent of the New York *Times*, has propounded the doctrine that Mr. Johnson's plan of reconstruction was part and parcel of the military convention under which the South laid down its arms, and that Congress has, therefore, no more right to meddle with the arrangement than with the terms of surrender at Vicksburg. The "war power" is every day now receiving a touch from either secessionists or conservatives which promises, before they have done with it, to make it the greatest power ever wielded by a Christian ruler; and what is most significant about it is, that amongst the most ardent advocates of its extension now are many of those who two years ago denied its existence. According to Mr. Stephens's theory, if Mr. Johnson had chosen to agree to restore slavery, or to exempt the South from taxation, or to permit it to exclude all Northern men from Southern soil, the legislature of the country would have been compelled to concur. Commanders-in-chief are, in the eyes of these new expounders and defenders of the Constitution, wonderful fellows. George the Second might, under their ruling, have agreed to share his throne with the Pretender after Culloden in defiance of Parliament. If a constitutional convention is again called, one of its first duties should be to define the "war power," in the interest of freedom and common sense.

THE bolting members of the Tennessee Legislature who blocked the machinery of government by making a quorum impossible, have just been re-elected in almost every instance and by large majorities. So the situation is virtually unchanged, and sooner than allow the passage of any act discriminating against the disloyal, these men will probably repeat the manœuvre by which they threw upon Governor Brownlow the charge of supporting the State convicts and the inmates of the State asylums. He for his part has threatened, in that case, to let loose the criminal and the idiotic upon the community which refuses to feed them. Such a procedure would be sufficiently calamitous; but it may be doubted if the State would suffer so much from it as it would from relaxing the present restrictions upon the rebellious, and permitting them to regain their lost control of politics and society. As for the admission of Tennessee into the Union, we do not see that it has been advanced by this latest evidence of the temper of her people.

THOSE whom business called below the City Hall Park on Friday last must have been impressed with the urgent need not only of relieving Broadway, but also those narrow and most inadequate thor-

oughfares which flank it on either side. Into these the necessities of the fire department had turned the innumerable host of stages, with other vehicles of all descriptions, to test the patience of drivers and passengers, and to delay and imperil pedestrians—especially those who were seeking the ferries, on which depended their reaching home or journeying to other parts. This latter annoyance was only an exaggeration of what is experienced every day; and unless with the renovation of our piers there is effected a widening of the streets between the North River and Broadway, the suburban population of New York will soon be inclined to make their wills before venturing into the city, as the Roman soldiers used to do on the eve of a battle.

The street-cleaning contractors complain of being harassed and annoyed by the Board of Health; but as the result of this irritation seems to have been that they carted from the city forty thousand more loads of dirt than were ever before removed in the month of March, we hope the Board will continue to remind them of their engagement. "We have found ourselves," they say pathetically, "pretty much in the situation of Balaam's ass—the more we endeavor to please, the more we are satisfied that it is impossible to do so." The public are not far from their way of thinking; but the "impossible" pertains to the contractors, not to the job itself.

With the thirty-fifth letter of our Southern correspondent we close the transcript of the condition of the late Confederacy for which his nine months' journey was undertaken. We can confidently refer to the contents of this interesting record in justification of the title which we have uniformly prefixed to it—"The South as It Is." Our correspondent has all along given intrinsic evidence of his faithfulness as a reporter, neither adding to nor subtracting from what he heard and saw and noted. His letters have been absolutely free from the charge of exaggeration, and in this is the secret of the weight which we believe they have had with every thoughtful reader. We leave it to others to award the praise due them for their style of composition, which has been, we may be permitted to remark, in striking contrast with that of the common run of newspaper correspondence during the past five years.

The New York *Times* takes alarm at the smallness of the minority in Congress, and thinks a strong minority greatly needed. We do not quarrel with this opinion. There cannot be a question that a compact, clear-headed, patriotic, even if mistaken, opposition would improve the character of our national legislation, by compelling every project, resolution, bill, or amendment to undergo the most searching scrutiny and the most intelligent debate. Such a minority, if it had existed during the war, and made its loyalty transparent, might have saved us from a good many precedents of the abuse of power for which we are now paying dearly. The trouble was and is, that the minority (which is none the less the minority because the President is at its head) has neither virtue nor principle, nor any decent claim upon the public respect. The only real strength which minorities or majorities can have lies in a consistent attachment to our republican polity and the spirit which makes it vital. The fatal blunder of the opposition in the four years of battle was not in denying the legitimacy of the means but in denouncing the end, which was the forcible suppression of revolt. The blunder of Messrs. Garrett Davis, Reverdy Johnson, Rogers, and their associates is again in opposing the sacred object of the nation to protect its inhabitants in the enjoyment of impartial rights. The President errs with them. If the *Times* also finds itself in their company, it is not because it is driven there; but its accession will not make the minority a strong one.

The *World*, recovering its breath after the passage of the civil rights bill, returns to its old query—"Is the Rump a Congress?" Mr. Johnson had suggested that it was not—at least for the purpose of legislating for the South; but he failed to justify his own boasted approval of bills which bear upon all parts of the common domain. The *World* apologizes for him, as it were, by saying that "so long as Congress confined itself to ordinary and necessary legislation, and passed no laws for which it had not some color of competency," it was "prudent not to raise the question of authority." As if Congress were not the sole judge both of its own competency and of what is or is not "necessary legislation." The laughable portion of the *World's* argument is that in which it cites the words of the Constitution—"No State without its consent shall be deprived of its equal suffrage in the Senate." If the seceded States did not voluntarily relinquish their representation in the Senate, we should like to know under what circumstances a State can do so. But will the *World* please tell us whether New Jersey is just now "deprived of its equal suffrage" by its own consent?

Mr. Scovel's character has not emerged from the cloud under which it labored when we last examined it. He forced the New Jersey Legislature to adjourn last week without filling Mr. Stockton's place in the United States Senate; but as he did not succeed in filling it himself, and was expelled from the Union League of Camden, and has utterly destroyed all future chances of preferment with the Republican party, it seems to us that the balance is against him.

"Admiral" Semmes has been released from custody unconditionally, the case against him, for having made his escape on board the *Deerhound*, having broken down utterly when submitted to a board of naval officers, as we predicted it would. How anybody ever got it into his head that a man could be tried by an enemy's court-martial, after the war was over, for having made his escape when a prisoner of war, it is difficult to understand.

The New York *Times* has at last discovered that there is some necessity for the civil rights bill. A good deal of ingenuity is still expended by its enemies in discovering horrible consequences likely to result from it—such as the probability of "genteel" congregations having to sell pews to negroes. Then there always remains that most horrible contingency of all—of white women having to marry negroes. Already in Richmond they have got to advertising the marriages of blacks in the same column with those of whites.

General Burnside met no serious opposition in the Rhode Island election last week. The number of generals who are becoming governors of loyal States ought to cause a little reflection in those who recommend the President to attempt a *coup d'état*.

Mr. Saulsbury, of Delaware, presented to the Senate the painful alternative of believing either that the civil rights bill was unconstitutional, "or that some five-and-twenty years' diligent study of the law had availed him nothing."

Our Paris correspondent describes the circumstances which marked the first performance of M. Augier's rather ominously named play, "Contagion," at the Odéon. The Latin Quarter was in full force, as lately at the summons of "pipe-en-bois"—in the streets, blocking the progress of the Emperor and Empress, amid cries of "Vive le Luxembourg!" "Vive Glais-Bizoin!"—in the theatre, applauding every passage of the play that might have a political significance. Especially was the sentiment, "There comes a day when despised truths assert themselves with thunder-claps," received with appropriate noisiness of approval. Out of this affair has arisen the gravest rumors of state changes: one, that a military ministry will be established; another, that the Emperor, by a plebiscitum, will fundamentally alter the institutions of France, and turn the legislative assembly into a close corporation. Shrewd observers regard these speculations and the causes of them as symptoms—the Emperor understands of what.

The orators who were brought out to celebrate Washington's birthday have not been approved abroad. Mr. Bancroft, at Washington, is accused of a want of courtesy; but President King, at Rome, was courteous to excess, delivering, it is said, a panegyric on Pio IX. "Strange," says an Italian journal, "how these young republicans and democrats praise the government of the Pope while they denounce Maximilian's as dreadful, and while Russia breaks off intercourse with the Pope!"

A DEFECT in the Italian law concerning marriage has been revealed at Florence, where a priest married a young couple without ascertaining if they had first been joined by a magistrate. For whatever reason, the bridegroom presently sent his wife home to her parents, and refused to obtain the legal confirmation of their union. The law, which does not recognize his having been married, of course does not hold him guilty of any offence. These knaveries are avoided in France by prohibiting the intervention of priests till the civil ceremony has been performed.

M. ROGEARD finds no rest outside of his lost paradise, Belgium. At Prague he secured a publisher for a new work giving the history of his famous "Labienus" pamphlet. But, spite of the apothegm of the Imperial author of the "Life of Cæsar," that "historic truth ought to be no less sacred than religion," the book has been confiscated at the instigation of the French embassy.

THE obliging inhabitants of Tashkend—Russia's latest conquest in Khokand—have abolished slavery, say advices from St. Petersburg, "out of deference to the Emperor."

IN Italy they have a printing telegraphic machine that works between Milan and Neufchâtel—forty miles—at the rate of twenty words in twenty seconds. This is the joint invention of Bonelli and Hipp. Between Paris and Marseilles they use the Caselli apparatus, which reproduces the autograph of the person transmitting the despatch.

NAPOLEON has replied to the address of the Corps Législatif. He complains of the "fardel of government," which only "a sense of duty and the consciousness of a mission to be fulfilled" persuade him to endure. He does not propose, however, to share this burthen with the deputies of the people; but, with all his cares, is evidently of the temper of Tiberius when he affected to avoid inheriting the supreme authority, and was asked by an imprudent senator, "What part will you take, Cæsar?"

AUSTRIA and Prussia remain, as the foreign journals say, in a state of extreme "tension." A rumor has circulated and been contradicted of a warning note to Bismark from Lord Clarendon. War is freely spoken of as inevitable, and at all events arming goes on.

MINISTER ROUHER told the French deputies that they had, in abundance, the right of questioning Government, and that the entire session had been but a protracted interrogation. It was an ingenious assumption of virtue in a case of self-evident necessity. The "right" was in fact only a privilege; but an extorted privilege is next door to a right.

CONGRESS.

WASHINGTON, April 7, 1866.

THE week has been signalized by the repassing of the civil rights bill in the Senate over the President's veto. As this is the only instance in our legislative history, save one, where such a result has followed the veto of a bill, it marks the more emphatically the strength of the great cause of which the present Congress claims to be the exponent. The opposition had rallied all their forces to the defeat of this measure, and confidently expected to make it share the fate of the Freedmen's Bureau bill. After three days of extremely ardent debate, signalized by a speech of singular cogency and power from Senator Trumbull, the father of the bill, the vote was reached at about seven o'clock on Friday evening. The customary throng of auditors which attends the Senate on every occasion of public interest, crowded the galleries. Among them were some hundreds of men of color (always of late a regular element in the audience which watches the deliberations of Congress), whose dusky but earnest faces were bent upon the fate of the bill which embodied the last hope of their race from the protecting hand of the nation. The shaded jets of gas, shining through the armorial bearings of the States emblazoned upon the glass ceiling of the Senate chamber, threw a soft light over the scene, which was watched with eager interest by multitudes who saw in it an epochal event, the influence of which would far outlive the hour. The last words of debate had fallen from Senator McDougall, of California, and the roll was called amid a hush of which the previous buzz and excitement had given little token. The senators answered to their names with an emphasis that was unusual, and all felt that the issue was one far transcending in importance any that had yet been determined by the vote of the Senate. Although the majority was well ascertained to be over two-thirds, should senators vote in accordance with their convictions of what was right on the first passage of the bill, yet such had been the defection upon the veto of the Freedmen's Bureau bill that it was felt to be doubtful whether even a single vote might not turn the scale. When the loud "aye!" of Senator Morgan had decided the doubt, an irrepressible enthusiasm of applause burst from Senate floor and galleries, in which the usually stately and placid Governor Morgan was actually seen to join (doubtless unconsciously to himself), and when the end of the roll was reached, and Vice-President Foster announced the result, nearly the whole Senate and auditory were carried off their feet, and joined in a tumultuous outburst of cheering such as was never heard within those walls before! A few feeble hisses from dissentient "Copperheads" only added emphasis to the triumph. In spite of the grave breach of decorum, no one seemed to feel that it ought to be helped, and the immediate adjournment of the Senate rendered the order to "clear the galleries" superfluous.

The House has now to act upon the measure, and its action is not doubtful. The moral effect of this radical success cannot now be accurately predicted, but there are not wanting those who presage not only a more bitter and irreconcilable warfare between Congress and the Executive than before, but an absolute "secession" of the latter to the side of that party which opposed the war, and which now demands that all the fruits of the war be surrendered by the victorious party.

It is barely possible that a common ground may yet be discovered on which the different branches of the Government may work together. Senator Stewart is pressing his scheme of restoration for an early vote, in the hope that Congress will adopt it or modify it so as to present some complete scheme to the country on which the Union party can stand. Senator Lane, of Kansas, on the other hand, has a scheme which he claims (by what authority does not yet appear) will be accepted by the President, the noteworthy feature of which is a qualified suffrage conferred upon the negroes and the immediate admission of loyal representatives to Congress.

DIARY.

Monday, April 2, 1866.—In the Senate, a message was received from the President with a memorial from the Legislature of Alabama asking extension of time for completing railroads which had received land grants from Congress. Printed and referred. Numerous petitions for an increased protective tariff were presented, also for amendments of the Constitution. Mr. Wilson reported a new bill for the equalization of bounties. Mr. Fessenden reported the House loan bill, without amendment. A bill granting lands to aid the Iron Mountain Railroad of Missouri was passed; also a bill to define the powers of the District of Columbia Supreme Court. The bill to re-organize the judiciary of the United States was discussed.

In the House, Mr. Shellabarger offered a bill to protect citizens of the United States in their privileges and immunities in the several States. Mr. Pike offered a resolution that the Secretary of the Navy send a naval force to the fishing grounds of the British Provinces to protect the rights of American fishermen. Referred. Mr. Raymond offered a resolution that the President appoint a commission to report upon the necessity of aid from the Government of the United States in improving the means of transportation between the Western and Eastern States. Laid over. Mr. Schenck reported the army bill from the Committee on Military Affairs. Made a special order for April 12. On motion of Mr. Grinnell the Committee on Printing were instructed to enquire what reforms are needed in the Government printing. Mr. Ashley offered a resolution looking to a legal provision to supply any vacancy in the office of Clerk of the House by death or disability. Referred. Senate bill to punish counterfeiting of United States securities was passed; also, Senate bill to transfer the custody of the library of the Smithsonian Institution to the Library of Congress; also, Senate bill granting lands to Michigan for a ship-canal to connect Green Bay with Lake Michigan was passed.

April 3.—In the Senate, Mr. Sumner offered a resolution requesting the Secretary of the Treasury and Postmaster-General to report whether any officers have been permitted to take office under their departments since December last without taking the test oath. Adopted—yeas, 25; nays, 9. A bill authorizing the President to sell a gunboat to the Government of Liberia was passed. Several bills relating to the local affairs of the District of Columbia were passed. The bill to re organize the judiciary of the United States was discussed and laid over. The Finance Committee reported adversely on the House resolution to extend for two months the time for collecting the income tax of 1865. Laid over.

In the House, bills were passed to regulate the appointment of rear-admirals in the navy; to organize the pay department of the navy; and to reimburse losses to naval officers. The Committee on Naval Affairs reported a bill in favor of League Island, in the Delaware, as a site for a naval depot. Laid over. The rest of the day was spent in discussing the Brooks and Dodge contested election case.

April 4.—In the Senate, a communication was received from the Postmaster-General stating that no persons had been permitted to take office under that department without taking the test oath. Several petitions were presented praying for adequate securities against disloyal States, for an increase of the tariff, and for an international copyright. A joint resolution, providing for burial of soldiers who died in the military service, was passed. Mr. Stewart called up his resolutions setting forth conditions on which the rebellious States may be restored to representation in Congress. He said the time had arrived when Congress must choose between the President's plan of restoration and anarchy, unless it was ready to adopt a plan of its own. The whole country was in confusion, and Congress had adopted no platform. Pending Mr. Stewart's speech, the special order, being the President's veto message, was taken up, when Mr. Trumbull spoke three hours, defending the civil rights bill against the objections of the President. The bill to re-organize the judiciary of the United States was passed—yeas, 23; nays, 6. (This bill abolishes the circuit courts of the United States, gives the district courts original jurisdiction of all cases now tried in circuit, and establishes a court of appeals in each existing circuit, to consist of the justice of the Supreme Court assigned to that circuit and of the several district judges composing the circuit. This court is to have appellate jurisdiction only, and its decisions are final upon all questions of fact; but an appeal on questions of law may be taken to the Supreme Court of the United States when the matter in controversy exceeds $10,000.)

In the House, a message was received from the President, recommending that Alabama and the other Southern States be allowed to assume and pay their proportion of the direct tax of 1861, and enclosing a letter from the Governor of Alabama asking that that State be allowed to pay said tax in State bonds. Referred. The contested election case of Brooks and Dodge again consumed the day.

April 5.—In the Senate, George F. Edmunds was sworn in as a senator from Vermont, to succeed Senator Foot. A joint resolution was passed guaranteeing bounties to certain colored soldiers and pensions to their heirs. The veto message was discussed by Messrs. Johnson and Cowan in its favor, and by Messrs. Trumbull, Stewart, and Wade on the other side.

In the House, Mr. Schenck reported a bill to give three months' extra pay to all army officers below the grade of brigadier-general who were in service March 3, 1865. Passed. The contested election case of Brooks *vs.* Dodge again occupied the day.

April 6.—In the Senate, Mr. Lane, of Kansas, offered a joint resolution providing for the admission into Congress of senators and representatives from any rebellious State upon the adoption by such State of the following measures: 1, Nullifying the ordinances of secession; 2, Ratifying the Constitutional Amendment abolishing slavery; 3, Repudiating all rebel debts and recognizing the debts of the United States; 4, Extending the elective franchise to all men of color over twenty-one who can read and write and to all who own real estate to the value of $250. Mr. Lane defended this scheme of reconstruction and attacked Mr. Wade for an assault upon the President for his veto of the civil rights bill. Mr. Wade replied with great warmth, denouncing the "treachery" of the President. Mr. Doolittle defended the President, and gave his reasons for disregarding the instructions of the Wisconsin Legislature to vote for the civil rights bill notwithstanding the veto. Messrs. Davis, Saulsbury, and McDougall spoke against the bill. The question was then taken upon the civil rights bill, and it was passed over the veto of the President by a vote of 33 yeas to 15 nays, being one more than the requisite constitutional majority. A message was received from the President recommending a modification of the test oath in the case of United States officers in the Southern States. Referred. Adjourned to April 9.

In the House, several private bills were acted upon, after which Mr. Dawes, chairman of the Committee on Elections, closed the debate in the case of Dodge *vs.* Brooks, the former contesting the seat of the latter as a representative from the eighth New York district. Mr. Garfield moved to recommit the case to the Committee of Elections to take additional testimony. Lost—yeas, 53; nays, 80. The House voted—yeas, 84; nays, 45—that Hon. James Brooks is not entitled to the seat, and then decided—yeas, 72; nays, 52—that William E. Dodge is entitled to represent the eighth district of New York. Mr. Wilson reported from the Judiciary Committee the Senate bill to re-organize the judiciary of the United States.

April 7.—The Senate was not in session. In the House, speeches on the state of the Union were made by Messrs. Hogan, Baldwin, Harding (of Ill.), Lawrence, Le Blond, and Clarke (of Kansas). Adjourned to April 9.

THE FREEDMEN.

The agitation on the Sea Islands concerning the distribution of lands is subsiding, and the freed people are beginning to make contracts more freely. In the Charleston District "nine-tenths of all able-bodied men have entered into contracts and are laboring creditably." The report from Greenville C. H. District, however, is not very encouraging. Instances of personal violence against the freed people are of not uncommon occurrence. One person had made the boast to a prominent citizen that he had shot twenty-eight negroes since "the surrender." A colored man, who had been a soldier, on returning to his home near Greenville C. H., was deliberately shot, in the presence of other freed people, and then, as the wound was only slight, a rope was placed about his neck and he was choked to death.

A State official, writing from Annapolis, says that rowdies are continually abusing and maltreating the freed people, and that it is difficult to find a jury that will convict a white man for an outrage upon a colored person. The feeling against colored schools in Maryland is very bitter. Teachers have been stoned and driven away, and indignation meetings have been held and resolutions passed to allow no teachers of colored people to live among them.

Several cases of petty larceny, by freed people, have been turned over to the civil courts of North Carolina—the sentence for which has generally been the old and barbarous mode of whipping. Col. Whittlesey, the assistant commissioner, says the negro has little chance of justice before civil tribunals in that State yet.

Reports from Texas show a continued improvement in that State of the condition of the freed people, though there are no indications of an increase of loyal sentiment toward the Government. The large numbers of Germans in Texas are employing the freedmen freely, and generally paying them good wages. There are twenty-eight day-schools and eight night-schools for colored people reported, with a total attendance of twenty-four hundred and forty pupils.

"Almost without an exception," says General Sprague, in his report of affairs in Arkansas, "the planters report that the freedmen are working to their entire satisfaction." During the month of February 5,068 white persons were fed and 567 colored.

Colonel Thomas reports, from Mississippi, that the schools are increasing and in a flourishing condition; that there is a great demand for labor. "Neighbors, in their eagerness, sometimes quarrel over the freedmen, who are benefited by such differences to the extent of being able to choose between the contestants for their services, and thus secure liberal contracts. The freed people are getting an average of $15 per month and board.

The chief medical officer of the Bureau states that ten per cent. of all cases of sickness reported, in charge of the Bureau, are small-pox cases.

Brevet Major-General J. B. Kiddoo has been ordered to Texas to relieve General Gregory as assistant commissioner.

The efficient and devoted State Superintendent of Education in South Carolina, Mr. Reuben Tomlinson, makes a highly interesting report to Gen. Scott, the assistant commissioner, under date of March 15. It appears that the number of registered pupils is 7,998, and the average attendance 5,149—or about 64 per cent. (This may be compared with the per-centage of attendance in California during the past year, which was 59; or with that of Calvert Co., Md., the only one given in Superintendent Van Bokkelen's otherwise very instructive report, which was 56.) Of boys there are 3,732, and of girls, 4,266. There are 1,325 over 16 years of age, and 691 under 6. Learning the alphabet, 1,550; number who read and spell, 6,448; who study mental arithmetic, 2,910; written arithmetic, 736; geography, 1,180; who write on slates, 3,137; in books, 1,058. Of mixed blood, 2,153; pure blacks, 5,845; free before the war, 491. There are 136 teachers, of whom 41 are native, and 36 colored. The remainder are from the North, under the auspices of the various freedmen's societies, or (12) of the United States Tax Commissioners, or (1) of a private person. Rev. F. L. Cardoza, principal of the "Saxton school" in Charleston, reports that, at the end of the present term, 30 boys and 70 girls will be prepared to become primary teachers. He says:

"This Normal feature of our school bids fair to be a complete success. I have a class of three boys who have advanced so rapidly in their English studies, and have shown such talents and industry, that I thought it advisable to teach them Latin in connection with their English studies. I have been teaching them now for about two months, and their progress justifies the step I have taken. These boys look forward to a profession, if they can obtain a collegiate education. They are from the class known before the war as the 'free colored people,' who enjoyed more or less educational advantages."

Besides the schools already enumerated, there are twenty others regularly established, with thirty teachers; but they have made no accurate returns. Mr. Tomlinson states that there are numerous volunteer schools all over the State, taught mainly by colored men and women who can read and write, and which deserve to be fostered for the gratifying spirit which is evidenced by them. Unfortunately they are scantily supplied with books, and the superintendent cannot help them. He urges their case upon the freedmen's societies of the North.

The pupils of these schools, in connection with those regularly appointed, make the total for the entire State at least twelve thousand school children.

—The colored citizens of Richmond celebrated the 3d inst. as the anniversary of their actual emancipation with banners and a procession and public exercises. Notwithstanding the threats and forebodings of their enemies their deportment was unexceptionable, and the peace of the city was never less disturbed. General Terry did not allow himself to be argued or bullied into a panic, and consequently the country has not been deprived of the righteous spectacle of an observance of the overthrow of the Confederacy in its capital—of the rebellion in its last stronghold.

Minor Topics.

A VERY vigorous and very amusing discussion has been raging between the *Times* and *Tribune* during the past week as to the propriety of calling people "liars" in the columns of newspapers. Mr. Greeley's tendency to indulge in the use of this epithet has long been the occasion of complaint on the part of his contemporaries of the press, but the more they remonstrate, the more tenaciously he clings to it. He defends himself always by the allegation that it is the people who lie who are to blame, and not he, for anything impolite or barbarous there may be in the making of the charge. If anybody finds fault with him for calling Smith a "scoundrelly liar," he simply replies that Smith did lie, and that all liars are *ex vi termini* "scoundrelly." The trouble with Mr. Greeley really is, that he cannot be persuaded of the difficulty there is in proving that a man has lied on any particular occasion. Lying consists not simply in making a false statement, but in making it knowing it to be false, a fact of which editors are often forgetful, as is shown by the charge which one occasionally reads in newspapers made against people of "having lied, knowing it to be a lie." A man never lies unless he knows he lies, and the cases are very few in which this knowledge can be predicated with certainty of any utterer of falsehoods. If one says that he went to Albany yesterday when he really did not go, he clearly lies; but if he says that Mr. Greeley was engaged during the war in treasonable negotiations with Jefferson Davis, he does not clearly lie, for he may possibly believe it. It seems as if there could hardly be any distinction plainer than this, and yet controversial writers and speakers seem constantly to forget it. Nearly every one who is very warmly enlisted in a cause, and whose mind is not exceedingly well disciplined, is apt to imagine that his opponents are all immoral persons, capable of almost any enormity which does not expose them to the state prison. Few men have done good causes greater service than Mr. Greeley, but he has in serving them come to look on difference of opinion as in some sense an indication of depravity. He is not by any means peculiar in this. It was the fashion in England during the earlier part of our war to talk of protectionists as if they were pickpockets. The devotion, real or supposed, of the Northern States to the doctrines of this school of economists was treated, even by such democrats as Miss Martineau, as proof of downright villany, such as deprived them of all claim to English sympathy, though only fifteen years previously nearly the whole of the English gentry were rabid protectionists. Mr. Greeley, on the other hand, is equally satisfied of the depravity of free-traders; would hardly venture, if one may judge from his language, to leave one alone in the room with his silver spoons, and seems firmly persuaded that habitual lying is the least of their vices. All this, though amusing, is melancholy. Some people think that there is something peculiarly horrible in the notion that political questions are questions of expediency; that if you deny that the tariff or the suffrage or the merits of a well-meaning book may be seen from different points of view by good men, there is no knowing when you may rob a church. And yet there is nothing more certain than that political as well as all other progress has increased in the direct ratio of the toleration for differences of opinion. There will come a time here—and we hope Mr. Greeley will live to see it—when sincere and earnest men will think calling political opponents "liars" and "knaves" the very feeblest weapons that can be used against them. How near we are to that point already is shown by the comfort which the people denounced in newspapers as "liars" and "knaves" continue to enjoy. Their friends, who if they believed the charges against them would close their doors upon them, are as kind and cordial as ever, their wives just as faithful, their children just as affectionate, their creditors just as easy in their minds. How many of those whom Mr. Greeley, or any other editor, has during the last fifteen years treated to these epithets, have suffered from it either in mind, body, or estate? Whose word is doubted because he is accused in an editorial of cheating, lying, and defrauding? Do not the public laugh over talk of this kind just as they laugh over the vituperation of two bellicose ragpickers in the public streets? And might not the public fairly expect that editors would give up this mode of warfare for their own sakes?

WHEN a great robbery has been committed, which is about once a week at present, a reward is offered for the return of the property stolen, sometimes openly with the advertisement that no questions will be asked, and nearly always with an understanding to that effect. Diamonds are carried off from a gentleman's house, and the thief, after a diplomatic exchange of letters, hands back the precious stones and pockets more than he could have got for them from a receiver. A man is arrested by certain detectives with some of the Exchange Place bonds in his possession; and certain other detectives complain bitterly that this officious interference has broken up an arrangement they had made with this rogue to get all the bonds together, and return them for a share of the reward. And the newspapers echo their lamentations and sneer at the officiousness, or greediness, or stupidity of the parties who made the arrest. It would be well for those who have been robbed and for the detectives they employ to turn to Vol. II. of the Revised Statutes, and to read the section concerning compounding of felonies. The gentlemen who promise to ask no questions will find that they are placing themselves side by side with the thief; and the officers who track him to secure his plunder and not his person, may see that they also are criminals liable to arrest and punishment. There is no more law for the imprisonment of thieves than there is for the imprisonment of compounders. The penalty for this offense, it may be useful to mention, is state prison for a term not to exceed three years, or the county jail for six months in mild cases. This provision of the statute against compounders rests upon sound sense. The State arrests a thief and punishes him to put a stop to his depredations, and to deter others by fear from committing them. Its object is to protect its citizens. Those who allow the rogue to escape for their own profit, whether private individuals or policemen, defeat the ends of justice and injure the public. The public has no particular interest in the return of property to the careless people who allow it to be taken from them; their loss is a secondary consideration—the interest of the public is that the thief should not be allowed to escape punishment. This system of rewards and settlements not only turns him loose but encourages him to try again. It is a premium on dishonesty. The diamond man carried off as much as a hard-working laborer can hope to lay up in a lifetime; and if the ingenious person who took the tin box in Exchange Place gets half of the reward said to have been offered, he becomes a man of fortune. Who will dig when robbery is not only profitable but safe? The rogue runs no risk unless he is caught in the act. If he secures his booty, he can make his own terms, and retire from the closing interview with dignity and *with his own money*. The same principle applies to compounders of felonies as to receivers of stolen goods. "The receiver is as bad as the thief," because he offers him facilities to dispose of his spoils, and makes robbery easier and more profitable. The compounder does the same thing, and in the eye of the law is also as bad as the thief. It would be well if the District Attorney would turn his attention to this matter, and put a stop to a practice which is making robbery one of the easiest, safest, and most remunerative of professions.

The special attention of the reader is directed to the Financial Review on another page. Its place among the advertisements is by no means significant of its value, but is resorted to only that we may obtain the latest intelligence of the market.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of THE NATION *should be addressed to the Editor.*

THE DELAYS OF CONGRESS.

WE have heretofore given a plain expression to our anxiety that Congress should mature and bring forward a comprehensive plan of reconstruction, so that there may be a distinct Congressional policy which the country may compare with that of the President. We retract nothing of this, believing that the times demand positive declarations of principle from those who claim the support of the people, and that mere negations will not suffice for statesmanship.

Nevertheless, what we have said upon this side of the question has been intended rather to urge Congress to perform its duty than to excite the discontent of the people with their representatives. And as persistent efforts have been made to kindle such feelings and to destroy the confidence of the people in those whom they elected for legislators, by exaggerating the delay of Congress to agree upon a general policy, it is only just that we should point out some of the difficulties which it has encountered, and show how far such delays are inevitable.

It is obvious that, other things being equal, a single despot can fix upon a policy and devise a plan much sooner than a constitutional assembly, numbering hundreds of members, all anxious to satisfy each other, and their constituents as well as themselves. The decisions of a republic cannot possibly be as prompt as those of an emperor, consulting only his own will, and subject to no limitations except in his purse. Dilatoriness is a part of the price which we must pay for free government. Sometimes it is an expensive burthen; sometimes it proves an actual advantage. In any case, it is clearly unavoidable.

No one who has not taken part in, or been at least a diligent attendant upon, the proceedings of a legislative body, has any adequate conception of the amount of labor which is expended upon the enactment of a bill, however limited may be its scope or unobjectionable its purpose. The average length of time required by the Legislature of this State to pass an unopposed bill of half-a-dozen sections is at least six weeks. A standing rule of both houses makes it practically impossible for any measure, introduced within less than four weeks from the end of the session, to receive any consideration, unless it has powerful interests at work for it. In Congress the delay is naturally still greater, owing to the magnitude of the interests involved, the larger number of members, and the absence of limit to the duration of the sessions.

But we have thus far made no allowance for debate, a branch of legislative duty which is often spoken of with contempt and impatience, but which Mr. Mill has wisely shown to be the best part of a legislator's work. The "speeches" which are read from manuscript night after night in Congress do not come under this head. They are a perversion of legislative oratory, not intended to affect the hearers, nor expected to have the least influence upon the course of affairs in the house in which they are uttered, but simply brought out for the benefit of constituencies. Under the present convenient but somewhat ludicrous arrangement by which these speeches are delivered to empty houses, while sensible members are working on committees or taking rest, the real business of Congress has not been materially delayed by appeals to buncombe. But every step toward reconstruction has given rise to *real* debate, such as the speeches of Messrs. Deming, Kelley, Shellabarger, Raymond, and Hale, in the House, and of Messrs. Trumbull, Fessenden, and Doolittle in the Senate, which have had a genuine influence upon the bodies to which they were addressed. Every such speech delays legislation in proportion to its power and cogency. An effective speech against a bill hinders its progress, for reasons obvious to the dullest mind; but a speech equally forcible in favor of a bill arouses the antagonism of its predetermined opponents, compels them to reply, and intensifies their resolution to contest every inch of ground.

These considerations apply to every legislative body, and experience has shown that they are universally true. The Parliament of Great Britain is no less slow in its operations than Congress. The present Parliament met in February, and has only passed two bills of public interest, both under the influence of a species of panic. The reform bill received its first reading on March 12, and will not be read a second time until April 12. If not then rejected, as it seems likely to be, there would not be the least expectation of its final passage before August.

The past history of Congress, moreover, shows that no great measures were ever pushed through in the early period of a session. The tariff bills of 1842, 1846, 1857, and 1861, the internal revenue bills of later years, and, in fact, all important laws for at least twenty years past, were enacted at the latter part of a session, and generally at an advanced period of summer. The compromise measures of 1850 were enacted in September, and the Kansas-Nebraska bill of 1854, though pushed through by whip and spur, was not passed until the middle of May.

The present Congress has encountered obstacles of an extremely unusual nature. It has been compelled to bear the heavy burthen of an Executive nominally in sympathy with it but actually opposed to all its wishes. It has not been at liberty to act upon its own sense of justice or its belief as to the will of the people, but has been constantly hampered by the fear of a veto. It has sought to bring forward first projects upon which the dominant party were supposed to be unanimous, and to test the President's views upon the mildest measures. It has received such rebuffs as prove that it would have been hopeless to attempt to reconcile the views of the President with those of Congress upon the broad question of reconstruction. As long as there was any hope of agreement between the two branches of the Government, it surely would not have been wise for Congress to destroy this hope by committing itself to a definite policy, without knowing whether it would be acceptable or not. If, as is *now* certain, *any* measure of reconstruction to which Congress could possibly assent was sure to be vetoed, then it might be unwise to make concessions which would be useless and might be misconstrued. If, as at one time seemed probable, some compromise was possible, then it would have been highly injudicious to have insisted upon all that might be deemed abstractly just and proper, and needlessly to have sacrificed the partial good that was attainable. In dealing with such a compound of fickleness and obstinacy as now occupies the White House, it was necessary to proceed tentatively; and although it has finally become clear that conciliation is wasted, and that no measure short of allowing unrestricted and exclusive sway to traitors will meet with the approval of the great man who claims to embody the whole United States in himself, yet surely Congress is not to be blamed for hoping to the last against the existence of such arrogance and bad faith.

Nor would it have been right for Congress to adopt a comprehensive policy without having taken and examined a reasonable amount of testimony upon the condition of the South. This task has not yet been fully completed, and it is not easy to prove that it could have been materially hastened. Already the charge is made that not enough testimony has been received, and this will be repeated and amplified on every occasion. Mr. Johnson's superior wisdom was satisfied by a few telegrams from senators elect and a few deputations of reconstructed rebels, but a less gifted Congress needs somewhat fuller evidence than this.

We might enlarge upon this view of the subject, but have said enough to show that Congress could scarcely be expected to have reached a fixed determination by this time, and that the people should be patient with their representatives. But we beg Congress not to accept this view as an excuse for procrastination. The time has arrived at which it must visibly *begin* to shape a policy. The people are not always as patient as they should be. They want some tangible proposition. Congress can agree upon some plan now with a clear understanding that it will be vetoed. If it can be passed over the veto, well; but if not, let it be something upon which we can go to the country with firmness and confidence.

CONTRACTION IN PRIVATE LIFE.

General Grant has said, when praised for his ability and that of his officers in bringing the war to its termination: "It was the men in the ranks who ended the war; all we could do was to bring them in contact with the enemy. It was the weight of their patriotism, their character, their spirit of subordination and self-sacrifice, which turned the scale. They must in the end have succeeded had we never been born." So it will be in the great economic war we are now called upon to wage. Congress can do much and Mr. McCulloch can lead with ability and conscientiousness; but in the end it must be the sober determination and the resolute persistency of each individual citizen which will bring us to that national solvency without which honor and honesty and virtue cannot permanently survive in the nation; without which a nation had better not be; without which to have preserved it was an error of our sons and our brothers. If it can be said of us that we, a republic born of such noble men and now regenerated by their equals, cannot show the necessary courage, self-sacrifice, and self-denial, cannot develop enough of wisdom and common sense to place that republic on a par with other nations in its economic interests, to give it the position which, without reference to other nations, it ought of right to occupy, then farewell to all hope of equal government based on the principle of voluntary duty.

It becomes then a matter of the utmost importance that we should rightly understand what our plain duty is in this matter, so that no man may err from ignorance. The question is one of great difficulty on account of its wide extent and the magnitude of the interests involved. Expediency becomes an unsafe guide when each man may be drawn by it in a different direction according to his interest, and it is unworthy, too, of what we have already done. Let us rather go back to principles, and to first principles. Let each man lay for himself some plan which shall have an element of duty in it, in which some patriotic principle shall be contained. Much has been accomplished when we have put the interest of the hour behind us and have fallen back on the absolute right.

We speak of the expansion of our currency and the inflation of our system. The real trouble is that we are expanded ourselves. Each man is on a paper basis, and is under bonds that the currency shall not be improved. This is our great danger. Correct this and there is no longer anything to be apprehended from the currency. The excess of it will then be useless and will contract itself. What we need is to prepare ourselves for contraction so as to make it possible. Our luxury, our ostentation, our speculation, these are the real elements of our expansion, and no one will undertake to say he cannot correct these if the welfare of our country depends upon it. These a contraction will, indeed, sweep away; but how well we shall be without them! And how much will remain if, not waiting for the inevitable day, we discard them now in the midst of our prosperity and strength. Courage will remain and independence and work. We shall no longer be lingering round the stock list, or the petroleum list, or the copper list, to see whether our fortunes have been made or marred by the miscarriages of other men whose actions are to us mere accidents; but we shall be getting a day's pay for a day's honest work somehow, whatever becomes of the currency. We shall leave the profits of petroleum or copper to those who do the work in petroleum or copper, and we shall take the profit of the work we do, sure and honest and sweet. How different a thing it is to *earn* a living from what it is to *make* a fortune; for a living is truly what we live by, it is work concentrated into life, but fortune is a gift of Fortuna, or chance—it cannot be made. How homely used to seem to us the terms "reckon" and "calculate," but how much more honest they are than "speculate!" What is speculation but guess-work—by the side of which reckoning and calculation are honorable terms? Let us away with all this froth and foam which have accumulated around the activity of each one of us. Let us pay our debts, mark off our losses, and turn over our outside concerns to those who understand them, to whom they are not outside. Let there be a general realizing, and let us all turn sturdily back to the work we understand and in which we can be usefully employed, usefully to ourselves and to the state. Then extravagance will leave us in the train of speculation; we shall become more courageous, more honest, and more happy; we shall no longer be *afraid* to wish for better times nor to *demand* from our legislators better laws than we now dare even hope for. Then, when we look at the old torn jacket in the closet, hanging there with the worn belt and cartridge-box, and think how cheerfully he who wore them had received his poor depreciated eleven dollars in the currency of his country—then the tears will come into our eyes to think how sad and unworthy have been our fancied trials, how inadequate our sacrifices by the side of his. Happy if we can then say, *Nec immemor tui hoc feci.*

FREE SPEECH AND THE EMPIRE.

The French Emperor seems to be, just now, somewhat in the predicament of the fisherman in the "Arabian Nights," when he opened the casket sealed with the signet of Solomon that he had caught in his nets, and found he had let loose a mighty spirit that threatened to kill him. By the decree of the 24th of November, he set free the omnipotent genius of political discussion in the Corps Législatif, and it is not slow to make use of its liberty. Whether the Emperor regards its manifestations as dangerous to his dynasty or not, at any rate he showed himself, in his speech to the Chambers, as desirous as was the fisherman to make this mighty power restrain itself within its former limits. "The country is tired of political theories. Let us throw them aside and occupy ourselves with promoting the welfare of the people." The right of free discussion was to be a gift something like that of their guineas to the Vicar of Wakefield's daughters, on condition that they never used them. But the spirit of free discussion, once at large, was not so simple as the genius with which the Arabian fisherman had to do, and it obstinately refused to be conjured back again into its old confinement, at least with its own consent. Indeed, the opposition seem to think that they can do nothing more effectual for the public good than to let it have full sway as long as they may.

The speech of M. Thiers on the 26th of February was one of the most significant utterances that have been heard in France since Bonaparte built his throne on the ruins of the Republic. It shows that he at least means to make use of his tongue, now that it is untied, to tell truths that, though trite, unhappily now have the force of novelty to French ears. Under the cover of perfect external respect *au personnage auguste* in whose hands the powers of the state were concentrated by the *coup d'état* of 1851, he makes a most scathing exposure of the crimes against liberty of which the Empire is the embodiment, and of its failure to accomplish the great design which it has undertaken to carry through to justify its existence. In repeating the list of fundamental liberties—"*les libertés nécessaires*"—he recites the catalogue of those which France once possessed, but which she has no longer: 1. Personal liberty, or the right to be free from arbitrary arrests, and to prosecute any official illegally interfering with it. 2. The liberty of the press, which, by its very terms, excludes the idea of a censorship. 3. The freedom of elections, including the right of the people to assemble and discuss the merits of candidates, and to exercise their right of suffrage without injury to their private interests. 4. The right of the legislative body, when elected, to discuss all questions affecting the interests of the nation, and not to be confined to simple remonstrance, or, as M. Thiers epigrammatically puts it, "*à déplorer les fautes commises et les payer*"—to deplore blunders and pay for them. He briefly shows the process of constitutional government with responsible ministers, and affirms that to make power dependent on the votes of the representatives of the people, is not to destroy it, but to establish it in its true strength. He recites the political tendency in all parts of continental Europe towards constitutional governments. Prussia, Denmark, Sweden, Italy, and even Austria and Russia, are all in possession of constitutional governments or on the way to have them. France, to whose example all these political regenerations are due, has but the mockery of a free government. For M. Thiers, being a Frenchman, can see no other source of political ameliorations than the French Revolution. We think that our own preceded in point of time that great upheaving, and was not without its result of constitutional government. And we acknowledge that our Revolution

was the legitimate descendant of those of 1642 and 1688 in England. But let that pass.

France having lost the exercise of these rights which she enjoyed under the Restoration and under Louis Philippe, what compensation has the Empire made to her for the sacrifice? Let us see, says he, from the things done since 1852 whether political liberty be useless and hurtful. The Empire has tried to strengthen itself by flattering the idea, born of the Revolution, that France is to give liberty to the nations of the earth. Hence the Italian war, the expeditions to China, Cochin-China, Syria, and finally to Mexico. The Italian war was popular, in a degree, but would it have been undertaken had the country had a voice in the matter? It was waged to establish the unity of Italy. Is it done when the Italian people refuse to pay the taxes that are its price? If the Italian unity fail, it is damaging to the home politics of the Empire. If it succeed, it will have created a nation of twenty-six millions ready to join hands with forty millions of Germans as against France, in case of need. Would France have done this had she been asked? Is France to abandon Italy, which is her own creation, or the Papacy, which is the creation of a thousand years? The dilemma is serious. And Poland! In 1863 France endeavored to negotiate in favor of Poland, and where is Poland now? What remained of her was destroyed without the conquerors of the Crimea even being listened to by the power they had conquered. And so of the distant expeditions; if the interference of the people could have hindered these, would the Government itself be very sorry for it now? Then the laboring class was to be helped. Its wages have been raised, but such has been the policy of the Government that bread is dearest when wheat is cheapest, so that the gain is only apparent. Then, was it necessary for this purpose to destroy cities in order to build them up again, swelling the budget to two *milliards?* And when the cities are finished, what is to be done with the laborers who have been thus factitiously accumulated within them? None of these things would have been done under constitutional government. True, liberty does not consist in this or that feature of national institutions. It is not decentralization, or else the nations of the Middle Ages had been free. It is not free trade, or Turkey were the freest of nations and America the least free. It is not even universal suffrage; for England is incontestably a free nation without it. "*True liberty is that which gives a nation the control of its own destinies.*" Nations may make mistakes, but not so many as a single man. He may act in haste; they must wait and consider. A free nation, then, is one which is obliged to reflect before it acts.

It is very possible that these voices in the air may be of warning to Bonaparte and so of service to the French people. He watches the signs of the times diligently, and obeys them when they are not to be mistaken. He has shown himself wise in his generation, and may not be unmindful of the meaning words which he has permitted to be uttered. His opinion of the French people is clearly that entertained by Galba of the Romans, that they are men "*qui nec totam servitutem pati possunt, nec totam libertatem,*" who could not bear either to be entirely slaves or entirely free. What liberty they are resolved to have he will graciously accord to them as the price of the remains of servitude that they are content to bear. Such words as these of M. Thiers must have a wide and deep effect on the general mind of France, and may compel a larger concession of rights than the Emperor imagined would be the logical consequence of his decree of November. Bonaparte is resolved that the Empire shall last his time, even though the deluge should come after it. And it may be that by a timely lightening of the yoke he may make it more tolerable for the French people, under his son, than the alternative of a revolution. He and France have been told how it can be done, if at all. France, we may be sure, has heard and marked the words: we shall soon know whether he has as well.

WHY GOVERNMENT ENGRAVING SHOULD BE THROWN OPEN.

So much time has elapsed since Government inaugurated the experiment of engraving and printing the bonds and other evidences of debt to be issued upon the pledge of its faith, that a correct judgment of the experiment can now be formed. We have refrained heretofore from commenting upon the subject from a desire to see the plan allowed full opportunity to develop itself.

The art of engraving is as much an art as painting, and the printing required for producing impressions of engraving has, on account of the difficulty and skill which have been brought to it of late years, become a part of that art, if it has not elevated itself into an independent one. There can be no monopoly of genius, and without genius there can be no art. There may be things resembling or suggestive of art and genius; there may be a long row of men set at work with the graver in their hand and the glass at their eye, and *something* may be the result of all this industry; but it will not be an achievement of genius.

There is a stern necessity that the issue of Government bonds should be protected against counterfeiting, reduplication, and over-issue, by the most stringent arrangements as to the system of provings and checks, and by the most abstract and powerful barriers of art. The need of this in our country is much greater than in any European country.

The European loans are often taken in one line by a single banking house, and seldom bring more than a few subscribers in immediate connection with the Government issuing the loan. The bonds for an entire loan can all be prepared and examined and counted, to see that they are just right, and not over-issued, before any are delivered. These bonds not unfrequently remain until maturity in possession of the very house or family which first received them from the Government. They are generally only transferable in writing, and every transfer adds to the guaranty that they are not counterfeits or over-issues. They are generally written all over with signatures—each a veritable pen-and-ink autograph of some functionary—put on in different stages of their preparation, and the omission of any one of which vitiates the whole. They are sometimes surrendered and cancelled, in order to be transferred, just as our railroad stocks are, and each new transferee receives directly from the proper office the bond which he thereupon knows to be genuine. Sometimes no bond at all is issued, but the person is simply recorded as being the creditor of the Government by a specified sum, and his signature and description are retained in order to identify him when coming to draw his interest.

Who does not see that none of these conditions can exist in our country? There are in Europe some so-called popular loans, but they are insignificant in amount as well as in the time during which their issuance continues. They are nothing in comparison with our loans in either of these respects, and both of these are sources of danger to the purity of the issue. The magnitude of our loans does not shake our confidence in them; on the contrary, it increases it, for the greater the issue, the greater the number of the people determined to have the loan paid at the proper time. Proportionately greater, therefore, becomes the duty of the Government to adopt those measures which will best secure the genuineness and unalterableness of its issues, in a form transferable by delivery without the necessity of endorsement.

Let us admit that the force of all these considerations is felt by the Secretary of the Treasury and that his aim is to pursue the policy which will best protect the issues of public stocks. Does the present plan, adopted by his predecessor, do it? Omitting for the moment the economical view of the question, we reply that the plan has swept away an entire system of checks against over-issues; which is not a very desirable beginning. No matter through how many different hands in his own employ the secretary may cause the bonds to pass before issue, the whole of them together only constitute one guaranty of the correctness of their issue—the guaranty of his own office. Heretofore, in addition to this, the public has had the assurance of a private guaranty, independent of the control of the Treasury, in the examinations and accounts rendered by the individual artists or engraving companies that have prepared the bonds. The paper which was used was patented, in the first place, and of the most endurable and satisfactory quality; every sheet of it was carefully counted by the manufacturer before delivery to the engravers, who counted it upon receiving it, and again when printing it, and again when delivering the bonds to the Government. In this manner every sheet of paper, suitable for the work, was distinctly traced and accounted for before it reached the hands of the Government. There the impressions were counted again, had the private marks or stamp of the department put upon them, and, when issued, were recorded; and thus every one of them was distinctly traceable, and was traced and accounted for. The engraving firms were required to give large bonds for the faithful performance of their contracts, and the impressions of the bonds were not allowed to accumulate in their hands, but were delivered so frequently that it would have been impossible for them to swindle the Government to any great amount, even if they desired to do so contrary alike to their duty and their interest—their bonds and their reputation being staked not only on their honesty, but also on their correctness. Now, this system of proving the issues of bonds is, by the present method, done away with altogether. Before, if the contracting engravers over-issued bonds, by counterfeiting on otherwise genuine impressions the marks or signatures reserved to be put on at the Treasury, and disposed of them, no officer of Government having received the proceeds, they, and not the Government, would be bound to redeem them. As it is, if an over-issue should be made of bonds genuine in all particulars, the loss would fall on the Treasury, while the facility for making such an over-issue is greatly enhanced. This is both unjust to the Treasury and to the un-

fortunate victims who may find themselves with such bonds on hand. The case of Whittlesy, recently convicted in Washington for abstracting some two hundred of the thousand dollar bonds prepared in the department, is a case in point; and there are rumors that much more serious things than that have occurred, the perpetrators of which have escaped detection.

The Government plan has also effectually stopped the progress of the art towards absolute security against counterfeiting. Heretofore each new advance has balked or at least delayed the counterfeiters, tasking their ingenuity to overcome it. Thus, the new green colors, which refused to be photographed, suspended for a long time this most successful mode of counterfeiting; and after that came indestructible colors, which so entered into the paper on which they were printed that they refused to be altered without destroying the paper itself. Genius, if allowed a fair inducement, will find other as important improvements as these, which are now as little dreamed of as these were before they were made. But this inducement is taken away by the present method. Most of the persons connected with the Bureau of Engraving and Printing are pensioned politicians, destitute of any artistic qualifications. The chief of the bureau, formerly the head of an unsuccessful flour firm in this city, was, in the early stages of the war, reported by a Congressional committee for disloyalty. The bureau has filled some of the Treasury chambers with a quantity of presses which cost a handsome figure, but which cannot be and are not used, as they are of a pattern which the engravers abandoned fifteen years ago. It has used an ink loudly heralded as being gold and indestructible, and which turned out bronze, and can be taken off with ease by our artists or altered in any way they please. It has used a patent paper that was to surpass anything ever dreamed of, and private skill has split it, so that the fractional currency can be genuinely duplicated. It has produced bonds that distress the eye, are disagreeable to handle, and worse to smell; and it has carried impudence to the sublime in disfiguring its fractional issues with the portrait of the man who has done these things. But more than this, it has removed from the engraver all incentive to strive constantly to surpass himself, by paying him not according to the quality of his work, but according to the number of hours daily for which he is engaged.

The experiment has cost at least four times what it would have cost for better work if the work had been advertised and given by contract to the best bidders. We know the figures can be so stated as to show great savings to the Treasury; but they will be none the less erroneous. They cannot reverse the fact that the expenses of engraving and printing were reduced to the minimum by the engravers of the country, and that they then were only respectably paid for their time, skill, services, and expenditures. It is notorious that one of the recent jobs of the bureau was the production of seven millions of bonds which were a *mistake*, and were destroyed, or reported to be destroyed, upon the order of a single person—an enormous transaction, which should have been ordered by Congress and superintended by a committee of that body. Now that the needs of the country no longer require the issuing of bonds by the hundreds of millions, there is no *honest* employment left for this immense bureau, and the salaries paid for idleness are justly chargeable in the cost of producing the bonds and notes heretofore issued. We leave the subject, expressing our conviction that public economy, as well as a due regard to the confidence that must be fostered in behalf of the public loans, suggests the wisdom of abandoning the policy of engraving by the Government and of throwing the matter once more open to the skill, the art, the ingenuity, and the competition of the country.

THE AMERICAN LECTURESHIP AT CAMBRIDGE, ENGLAND.

The university at Cambridge in England has lately been the scene of a curious incident, which, not only on account of its connection with American interests, but also because it illustrates the influences which prevail at that ancient seat of learning, is worthy of the attention of our readers.

In December, 1864, Mr. Henry Yates Thompson, scholar of Trinity College, Cambridge, a man of wealth and intelligence, having lately returned from a visit to America, addressed a letter to Mr. Everett in which he said:

"Since returning to England I have been more than ever impressed with the want of information existing among our people, and *especially among the upper classes of them*, about your country and all belonging to it. I trust to you to pardon my asking your advice and help in regard to a scheme which has occurred to me, and which, if feasible, would be, I think, a step towards mending this state of things.

"My wish is to endow a lectureship at Harvard University, its object being the delivery of a biennial course of twelve lectures during a residence of one term at Cambridge, in England, on the 'History and Political Institutions of the United States of America;' such reader to be appointed biennially by the president and fellows of Harvard University (subject to the veto in each case of the vice-chancellor of Cambridge), and his sole qualifications to be American citizenship and the opinion of his appointers that he is a fit person to deliver such a course of lectures."

After providing in a suitable manner for the stipend of the lecturer, Mr. Thompson proceeded:

"It may be asked why I do not make my application to my own university before writing to America. The fact is, that the very idea of a foreign readership, such as this would technically be, is entirely novel, and if proposed to our authorities at Cambridge by an individual member of the university, it might possibly not receive that serious consideration which I conceive it to deserve, and which it would surely get if backed by the approval of a great American university. It is further probable that the need of some measure of this sort is not so fully recognized by our authorities at Cambridge as it is by educated men in the United States, and by Englishmen who have mixed with them."

The letter from which these extracts are made reached Mr. Everett but a short time before his death, and was not answered by him. Mr. Thompson thereupon sent a copy of it to Dr. Hill, president of Harvard University, and in compliance with Mr. Thompson's desire, Dr. Hill, under date of May 8, 1865, addressed a letter to the vice-chancellor of the university at Cambridge, in which, after recapitulating Mr. Thompson's proposal, he continued with the following excellent words:

"In endeavoring to judge whether this proposition would be agreeable to your university, we have supposed the case of an offer being made to us to have courses of lectures on English history and English institutions delivered here by persons appointed by an English university. We should welcome such courses as an enlargement of our opportunities of education, and as giving us English views of English things more accurately than we could attain them in any other way. And it seems to us desirable to promote an intelligent appreciation of the character and institutions of each country by the educated men of the other."

The decision as to the acceptance or rejection by the English university of Mr. Thompson's proposal did not lie with the vice-chancellor, but with the senate of the university, and it came before that body only in February last, when the proposal was rejected by a vote of 105 to 73.

The question seems to have been discussed with spirit, in open debate, as well as in printed manifestoes, by the friends and opponents of the plan. The "fly-sheets" form a series of instructive documents, and enable us to judge somewhat of the tone of thought and the style of controversy at the university. The first in order of those which we have seen is that by the Rev. Charles Kingsley, whose position as professor of modern history gave importance to his opinion. He expressed himself strongly in favor of the plan, declaring with a remarkable frankness of confession that, "when I did myself the honor of lecturing in this university on the history of the United States, I became painfully aware how little was known, and how little could then be known, on the subject." Had Professor Kingsley said "how little I knew," he would, indeed, have come nearer the truth, for at the very time when he was lecturing, and was showing his ignorance of the subject and his deficiency in historical insight by his warmly expressed sympathy with the rebel cause, Professor Goldwin Smith and Professor Cairnes were proving by their works and words how much "*could* then be known" by historical students who pursued their investigations with a sincere desire to attain the truth. Mr. Kingsley goes on to say: "This great want [the imaginary want, we suppose, of the means of correct knowledge] has been since supplied by a large addition to the university library of American literature. I think it most important that it should be still further removed by the residence among us of an American gentleman." He then furnishes an illustration of the importance of increasing at least his own knowledge concerning America by the following argument, which affords a striking illustration of what seems the fact, that to be in error in regard to American affairs is the normal condition of the educated Englishman. He says:

"If there should be, in any minds, the fear that this university should be 'Americanized' or 'democratized,' they should remember that this proposal comes from the representatives of that class in America which regards England most with love and respect; which feels itself in increas-

ing danger of being swamped by the lower elements of a vast democracy; which has of late years withdrawn more and more from public life, in order to preserve its own purity and self-respect; which now holds out the right hand of fellowship to us, as to one of the most conservative bodies in this country, because it feels itself a conservative element in its own country, and looks to us for just recognition in that character."

Truly Harvard University is a conservative body, as every other institution of learning is conservative, but it would find it difficult to recognize itself under the mask which it wears in Mr. Kingsley's imagination. It will hardly admit that it can properly serve as an argument against democratic and in favor of aristocratic institutions. The men who govern it and the men whom it sends forth into the world are not generally supposed to be alarmed at the prospects of being swamped by the lower elements of our democracy, nor do they compose that wretched class of *fainéants* and *dilettante*, ruined by European associations and traditions, who withdraw themselves from public life "in order to preserve their purity and self-respect," or, as we should say, to nurse their vanity and indulge their fastidiousness. Mr. Adams represents Harvard University in England; Mr. Everett's name has been known there; and Mr. Kingsley might have paused before committing himself to insinuations against the purity and self-respect of such men as these. Nor does Harvard University require "a just recognition" from Cambridge in any spirit of solicitant humility. She is a little too old to be patronizingly patted on the head. "It is," adds Mr. Kingsley, "morally impossible that such men should go out of their way to become propagandists of those very revolutionary principles against which they are honorably struggling at home." We know not to what revolutionary principles Mr. Kingsley refers, but if he simply meant that no gentleman appointed to lecture would make himself obnoxious as a propagandist of republicanism or of democracy, he was undoubtedly right; if, however, he meant to gain favor for the scheme by suggesting that Cambridge would find the Harvard lecturer a man eager to assert the superior advantages of the Old World and likely to present a deterring picture of the New, he was as much mistaken in his supposition as in his facts.

In conclusion, Mr. Kingsley said:

"May I allude to one argument which would, of course, have no weight with the university in a question of right and wrong, but which may have weight in one like the present, of expediency? If we decline this offer, I fear that we shall give offense not of course to gentlemen like the rulers of Harvard, but to thousands who care as little for Harvard as they do for our own Cambridge. A sensitive people like the Americans, instinct with rational feeling, among whom news spreads far more rapidly than in England, will be but too likely to take up our refusal as a national insult. The lower portion of the American press will be but too likely to misrepresent and vilify our motives," etc., etc.

In this passage Mr. Kingley again shows so forcibly his need of an instructor from whom he might learn of American affairs and the conditions of American thought and feeling, that could we imagine this deficiency to have been as clearly recognized by those to whom his words were addressed as it is by us, there would have been little occasion for further argument on the importance of the proposed lectureship. The professor might have defied all opposition by placing himself firmly on the ground of his own ignorance. His syllogism was complete. "Behold, gentlemen," he might have said, "how ignorant is your professor of modern history; how much more ignorant must be my pupils; do not deny to them the opportunity of learning more than he can teach them!"

It is the more creditable to Professor Kingsley that, having so little real acquaintance with his subject, he at least recognized its importance so far as to say: "Of the general importance of the scheme, of the great necessity that our young men should know as much as possible of a country destined to be the greatest in the world, I shall say little."

Mr. Kingsley's fly-sheet was scarcely issued before Mr. E. H. Perowne, of Corpus Christi College, published an eager and ill-mannered reply to it. He regarded the scheme as "a proposal to send once in two years a stipendiary missionary to Cambridge, whose business it shall be not to propagandize (republicans never do that), but to acquaint our students with republican principles and their practical working in the American States. It is an arrangement by which (to adopt the felicitous phrase of an eminent member of the senate) we shall be favored with a biennial flash of transatlantic darkness." Growing warm with the ardor of controversy, he earnestly hopes "that such degradation may be averted from a university which was venerable centuries before the American colonies threw off their allegiance to the British crown." What, have a lecturer come to us from our revolted colonies to teach us revolution! Heaven forbid! And, worse still, "we have no guarantee that the lecturer who is to come here to teach us shall be (I say not a member of the Episcopal Church of America, but) a Christian at all. For aught we know they may send us a Mormon, a Spiritualist, or even a Socinian!"

The *odium theologicum* being thus dexterously aroused, Mr. Perowne returns to his first and favorite bugbear. It is not only in his eyes a rank political offence to hold republican principles, but an immorality to express them, and an immorality which is combined with ignorance and want of breeding in all Americans. "Professor Kingsley," he says, "tells us, in ambiguous phraseology, that 'it is morally impossible that such men' (as the American promoters of the scheme) 'should go out of their way to become propagandists of those very revolutionary principles against which they are honorably struggling at home.' But he must know" [and here let the reader observe Mr. Perowne's courtesy, so characteristic of aristocratic breeding and the culture of a dignified university] "that it is morally (or otherwise) possible for American republicans to become propagandists of republican principles to the utmost of their power, and not only possible, but probable—but certain—that they will become so." In Mr. Perowne's heated vision he beholds the lecturer, like the tempter at the ear of Eve, instilling the dangerous words of seductive democracy into the hearts of the rising aristocracy, or like the "Young Columbian," who has lately served such good purpose in the *Spectator*, waving the flag of his country in the eyes of the British lion and challenging him to come forth to the contest. It is not strange that Mr. Perowne, with such a vision before him, should close his address with words that sound like the far-off confused echo of some remembered eloquence. As we read them we fancy Mr. Perowne the Chatham of his college: "For the welfare of our students, for the dignity of our beloved and venerable university, for the sake of avoiding a pernicious precedent in the interests of order, loyalty, and religion, I protest against the adoption of the proposed American lectureship."

Mr. Perowne's condition of mind is truly pitiable. He appears to be one of Sidney Smith's "ancient women, whether in or out of breeches, who are dreadfully afraid of America."

To Mr. Perowne's arguments Professor Kingsley briefly replied. He did not attempt to combat them in detail; but he drew the conclusion from some of Mr. Perowne's remarks "that they are fresh proofs of the necessity of an American gentleman coming hither to enlighten the members of our senate on the great question whether all Americans are or are not like the mythic down-wester, 'half buffalo, half alligator, with a streak of thunder and lightning.'" Under this sarcasm poor Mr. Perowne could not remain quiet. It stung him to a retort, which he closed with the words, "And this brings me to the question which alone has induced me to return to the subject: Is it not notorious that Harvard College is a stronghold of that form of infidelity commonly called Socinianism?"

The fray now became animated, and the next knight who appeared in the lists was Mr. Sedley Taylor, of Trinity College. He succeeded in unhorsing Mr. Perowne, and left him helpless on the field. "Mr. Perowne," he said, "feels certain that the lecturer will become a propagandist of republican principles to the utmost of his power. While I believe that there are strong reasons for thinking that he will *not*, I fully admit that many points must be touched on in his lectures on which an American and an Englishman would probably form different conclusions. But to dread the temperate expression of opposite opinion is, in the words of Professor Thompson, to betray an uneasy suspicion that our admiration of our own constitution is based on ignorance of all other forms of government."

In dashed Mr. A. Long, of King's College, full armed with "reasons for saying *non placet*" to the proposed scheme.

The third of these "reasons" was one of high philanthropy: "Because to give the rulers of Harvard University, and North Americans in general, the idea that we have no one who can undertake the task, is simply, at one and the same time, to cast a slur upon ourselves and pander to that which is perhaps the worst vice inherent in North American character, namely—SELF-CONCEIT." And this generous and lofty consideration is enforced by the sixth "reason," in which Mr. Long shows conclusively that he at least stands in no need of instruction concerning America: "That if the lecturer, in dealing with the character of his fellow-countrymen, should faithfully describe a North American of the true type 'clear grit,' then the sum and substance of what he would have to tell us face to face would be—however adroitly put—that the '*notions*' and '*intentions*' and '*duty*' and '*destiny*' of 'them everlasting Yankees' are 'to whip the Britishers' and eventually to 'cata-wampously chaw up creation, stock, lock, and barrel.'" And again, "Because, if the lecturer should proceed to speak of the process whereby the '*high-minded and highly educated class*' to which he belongs has been ejected from public life, and the motives which have led that class to submit so meekly to the ejectment—thereon the position of both parties, lecturer alike and listener, would become painful in the extreme, for the confession if garbled would be worthless, if open, humiliating."

With such reasons as these against the scheme, reasons so weighty, urged so ably, and with a candor and dignity so worthy of the great and venerable university, it would seem as if there had been no need of further protest. But another champion of religion, morals, order, and government against the insidious or open attacks of the prospective Harvard lecturer appeared in the person of Mr. H. R. Bailey, M.A. With great dexterity, and the skill of an accomplished *matador*, he waved the red flag of religious bigotry full in the eyes of the university bull.

"It is a painful thing," said he, "to write controversially on the most vital subject of all, religion. But are the members of the senate aware that Harvard University, as far as it professes any form of religion, is distinctly Socinian, or, if Americans prefer the term, Unitarian." . . . "Are we then prepared to ally ourselves with a university such as this? Can we be justified in placing a nominee of such a body in a position of authority and influence in our midst? [*sic.*] I shall hardly be told that I am arguing the case on a collateral or incidental issue; I hold this issue to be vital and fundamental. How can we expect soundness of thought or of teaching from one who is unsound on the most vital and central truth of all? How can there be right views of history or of Divine Providence when His authority is depreciated to whom 'all power is given in Heaven and in earth?' how a just estimate of institutions, when the church, the highest institution of all, is despised? or how can there be any correct or worthy criticism of literature, when intellect is unduly exalted, human pride ministered to, and reason made to hold a place for which it was never meant?"

The lectureship against which Mr. Bailey protested in these dark terms, terms worthy of the darkest age of intellectual weakness and moral decrepitude, having been rejected, it remains for him to get a vote carried that henceforth no text-books be used in the university but such as may be written by members of the Church of England; that for Plato shall be substituted Mansell; for Aristotle, Whewell; for Homer, Keble; and that Newton, Leibnitz, and Laplace be all banished from the curriculum. What an ideal university might be made on this system! How certain its attainment of truth! How happily limited its range of thought! Here should philosophy be kept alive by professors and tutors wise as Mr. Long, liberal as Mr. Bailey, and humble as Mr. Perowne. Here all vanity, all self-righteousness, all pride, should become extinct, and at length the type of the sectarian religionist should be complete. Even now Mr. Bailey seems to have come pretty near perfection, and he recalls to us the story told by "a don," in his recent entertaining book on the university, of one of the Fellows reminding a Cambridge man of the claims of the outer world to the common rights of humanity with the words "But I also am a Christian."

Mr. Edward Dodel followed up the lines opened by Mr. Bailey and Mr. Long, but the matter was settled. The danger to the church and to the state was too great. The lectureship might undermine each alike. Loyalty and religion, or what pass for such at Cambridge, were alarmed. The Queen and the bishops were in peril. Who could count on the permanent security of the British constitution if this revolutionary idea were carried out?

And so, spite of the remonstrances of the ablest men, spite of the votes of all the men whose names are known outside of the university, spite of the votes of Whewell, then Master of Trinity; of Thompson, his successor in this position of highest university dignity; of Bateson, Master of St. John's; of Clark, the public orator; of Kingsley and Lightfoot, and others of the same stamp, Mr. Thompson's proposition was rejected, and Cambridge remains free from the contamination of a transatlantic lecturer.

THE TRYST.

SOMEWHERE thou awaitest;
And I, with lips unkissed,
Weep, that thus to latest
Thou puttest off our tryst!

The golden bowls are broken;
The silver cords untwine;
Almond flowers in token
Have bloomed—that I am thine!

Others, who would fly thee
In cowardly alarms,
Who hate thee and deny thee,
Thou foldest in thine arms!

How shall I entreat thee
No longer to withhold?
I dare not go to meet thee,
Oh, lover, far and cold!

Oh, lover, whose lips chilling
So many lips have kissed,
Come—even if unwilling—
And keep thy solemn tryst!

H. H.

THE SOUTH AS IT IS.

XXXV.

BOSTON, April 3, 1866.

IN coming home from my long journey in the South, I travelled by rail through Connecticut, and it happened that for several hours my seat was shared with a merchant from Rhode Island. I expressed to him my pleasure at sight of a country so different from that with which the last eight months had made me familiar, and contrasted the pretty villages and busy, prosperous towns which we were passing, the trim fences, the neat dwellings, the frequent school-houses and churches, the carefully cultivated farms, and all the other evidences of intelligence and industrious thrift, with the dreary region I had just left, thinly peopled, full of uncleared forests and undrained swamps and sandy levels, the wretched railways and worse roads, the slovenly plantations with their mean houses, the hovels of the laborers with their degraded population, and the disorderly towns. Even in my seat-mate I found a striking contrast with a person whom he recalled to my mind, and whom I look upon as being in many respects a typical Southern man. I found that the merchant had cut from a newspaper, and had preserved with great care, a copy of the official telegram which announced the death of Mr. Lincoln—"the President," as he still called him—"Abraham Lincoln died this morning at twenty-two minutes past seven o'clock." The South Carolina planter, I recollected, had his memento also. In a fight with a marauding party of negro troops or camp-followers he and his neighbors had been easily victorious. He was willing to keep on his piazza floor, and I saw them there, the bleached skulls of the two men whom he had killed with his hands.

My companion questioned me about the Southern country and people. I had been for some time endeavoring to generalize from the mass of facts which I had collected. On some points my mind was made up, and on others I was still in doubt. Many of my conclusions, whether correct or incorrect, answered questions which I was aware were not of general interest. Therefore, when I fell into this gentleman's company, I took note of those questions which he seemed to think most important, and resolved to let them guide me in the preparation of this paper.

In his first question he asked for my opinion of the loyalty of the South.

I left New York at the end of June last, and before the steamer had reached Virginia began conversing with Southern men; and I remained in the late Confederacy until the beginning of March. During July and August I was in Virginia, and often talked with people of all classes, and heard them talking among themselves. It is commonly said that the Virginians were then more loyal than they are now; but this, in my opinion, is a mistake. By loyalty I understand fidelity to the Union and love for it. The vast majority of the people were as disloyal at that time as we may suppose them to have been in 1862. I very seldom found a man who thought that his State had done wrong in seceding, or that he had done anything but right in following her fortunes. Many men were ready enough to call secession a great mistake, and I heard more than one wish that Roger A. Pryor had been hung. Lincoln, it was said, would probably never have harmed the South if she had not seceded, and, of course, that policy must have been a bad one which needlessly provoked so disastrous a war. But it was not a wrong thing that had been done; only an inexpedient thing. To be sure, the South had been dreadfully defeated by the overwhelming hosts of their enemies—mercenaries from Europe and Yankees and negroes outnumbering General Lee's army in the proportion of five to one. But the South had been in the right. The first Southerner with whom I talked said that "anyhow, the war was all a d—d foolish piece of business, he supposed. Still, his State went out, and if she was to go again he 'd go with her." He was travelling on the steamer with me, and of him and his companions I said: "Rebels, I suppose, they may fairly be called, for those with whom I have talked, while ready enough to admit themselves conquered, still declare that it is only because their country is subjugated that they now pay obedience to the United States." A few days afterwards, another gentleman whom I met upheld strenuously the doctrine of State sovereignty and the right of States to secede. Coercion was tyranny, he said, and "he believed all Southerners felt so. From the meanest private in the army up to the highest men in the land, up to General Lee, all felt that the South had been most deeply injured." This same gentleman, in speaking of the likelihood that the freed people would be oppressed by State legislation, said that "the remedy for the evil would be found in requiring the States to take such action as should be satisfactory to the general Government. The general Government seemed to be doing what it liked." And this remark of his brings me to another statement which I would make n reference to the feelings of the Virginians at that time. They had never n all their lives been loyal as we understand loyalty, and they hated the federal Government with a hate that had been growing for four years amid the passions of war and the humiliation of defeat; but the power of the Government they feared, and they respected its authority. Pardoning had hardly begun; the country was full of soldiers. President Johnson, it was generally said among these people, was a bloodthirsty, narrow-minded, demagogical "poor white," who would wreak vengeance on the Southern aristocracy, which he had once envied and which was now in his power. So I used to hear Mr. Lincoln mentioned with respect and his death was regretted. The Virginians seemed ready to accept whatever conditions it might please the North to impose, and to look on all favors conferred upon them as concessions of the conqueror and not as rights to be demanded. This was the feeling among the mass of the people. It seemed to me that they recognized the fact that whatever the war may have been at the beginning, however technical may have been the questions then involved in it, it had grown to be before its end a struggle for mastery between contradictory social and political principles. Perhaps most Northern men had accustomed themselves to look upon the rebellion as a work of destruction merely, a movement designed to effect only negative results. As a nation the Confederacy, we thought, even if it conquered its independence, could live but a short life; its great work would be the disruption of the American Union. But the Southern people believed their success would mean not that alone, much as that was to be desired. It would mean, also, the maintenance of a peculiar social system, the establishment of a government with certain very positive and admirable characteristics. Naturally enough, then, and logically, they saw in the defeat of Lee the defeat of the principles he represented. Their army and all their cause was lost. Then, too, so very many Southern men knew almost nothing and were not given to close thinking. They had been beaten, they knew, and they expected to take the law from their conqueror. This was far from being the view of the politicians, though, as they were for the most part unpardoned, they were saying less then than afterwards, and it may have been a very incorrect view, but I think it was the one generally prevalent. Then, better than at any other time, the North might have reaped the fruits of the war. Even universal suffrage the Southern people would have accepted. Not willingly, more unwillingly, probably, than they accepted the Constitutional Amendment abolishing slavery, but with far less resistance than would be opposed to it now.

The Union men at that time were rejoicing, but they rejoiced in secret, for they had served a long and hard apprenticeship to humility and every species of prudential dissimulation, and they knew that they still lived among rebels, though rebels without arms in their hands. I knew several men of this class, and before the middle of August they were beginning to doubt if they had not been too hasty in rejoicing at all, and to wonder and fear if the secessionists were not more powerful at Washington and more in favor than the Unionists. Without any exceptions, they disbelieved utterly in the loyalty and good faith of their secessionist neighbors.

As the fall passed away and the winter began I travelled southward. In North Carolina, and only in that State, I found native Southerners in whose eyes it was a recommendation of a man that he was from the North. For it was true that the Northerners had beaten their secessionist neighbors and set free their slaves, and might perhaps confiscate their property and punish them for driving poor men into the woods; and they, if they did not love the Union much, hated their secessionist neighbors perfectly. But even there such people were not in a majority. On the edge of that district I even found one man who was in favor of equal suffrage for whites and blacks. As he told me so he lowered his voice and looked carefully to the fastening of the door. If the fact was known, his village would be no place for him, he said; he intended to leave it. In North Carolina there is more of the soil in which true loyalty may yet grow than in any other Southern State that I have visited. But even in that State Jonathan Worth was elected governor over William Holden, because Holden was opposed to the payment of the debt incurred to support the rebellion.

As I went on from North Carolina to the Mississippi, seeing much of the people everywhere, I concluded that they were but little inclined to accept what may be called the natural results of the war. And by that phrase I mean that the war seems to have settled that the political and social condition of the South is eventually to be the same with that of the North. The Southerners saw that slavery was destroyed, and in their conventions they were forced to say so and to ratify the Constitutional Amendment. Their conventions were also willing to rescind the ordinances of secession, and in the case of North Carolina, after a long debate, the secession ordinance was even declared to have always been null and void. It is my belief that when the States are left to untrammelled action it will be found that these enforced and reluctant admissions, and the further admission that in one civil war the South has been overpowered by the North, and in another civil war probably would be overpowered, are all that the South of to-day will concede. I am convinced that in all those cases in which the consent of the South to the demands of the country has not been so expressed as to be irrevocable, there is great danger that its consent will be revoked. For I could not see that, as regards loyalty, the South was different in any important respects from what it was during the war. The people were sorry for nothing but their ill-success, and they had more curses for the men who led them badly during the war than for the men who led them into the war. If their feelings and opinions in 1863 were such as the country then condemned, it seemed to me that the country could not help condemning them to-day. In 1863, to be sure, they backed their opinions by bayonets, and there is little danger that they would again choose to make war upon the North. They seem to be thoroughly convinced that the North is an overmatch for them. But what was worth fighting for through so many years must have been dear to them, and what remains of it is worth voting for. What harm they can do the Union by political action I do not know; but whatever harm they can do will, I think, be done.

For some time to come the South will be a unit on all questions of Federal politics. If the few Union men in each State had been supported by all the might and influence of the general Government, if treason had been made odious, the Union party might, perhaps, have gathered to itself all that class of doubtful and wavering men that exists in every community, and so have made some head against its opponents. But that opportunity has been lost.

I was constantly hearing abuse of the North and of Northerners. Yankees were stigmatized as cowards, robbers of women and children, vandals, braggarts, low fellows, avaricious, cruel, and mean. Not that every Southern man and woman talks in this way, and that every Southern child is brought up to despise Northerners; but a Northern man travelling in the South is continually made uncomfortable by such insulting language, and is never safe from it for two days together. If he hears nothing of it in the railroad car to-day, to-morrow he may be shut up in a stage with people who entertain him with nothing else. It is perhaps excusable in the mouths of a defeated people, but it does nothing to convince those who hear it that the victorious people are well liked.

ENGLAND.

LONDON, March 24, 1866.

THIS morning London was awake and stirring before daylight. The great Oxford and Cambridge boat-race has to-day been rowed for and won. Within the last few years this race—to use the phraseology of the sporting papers—has become "the aquatic event of the year." Owing to the state of the tides, the race had to be rowed at the unnatural hour of 7.30 A.M. We live hard in London; we—and by that plural pronoun I mean the metropolitan public who have any direct interest in the national universities—get up late, and go to bed still later; but yet on this one day of the year we were all up before the workmen and the housemaids. It is natural enough that old university men like myself should forego our usual number of hours' sleep in order to be present at the great race, in which the honor of the two rival universities is in some sense implicated. But it is more extraordinary that the great outside public should take the trouble to go down to Putney or Hammersmith in order to see eight Oxford lads rowing against the same number of Cambridge undergraduates. Yet, of the hundreds of thousands who crowded down to the Thames this morning, a very small proportion indeed can have had any direct or indirect connection with the universities. From London to Hammersmith must be a distance of at least five miles; but the whole of the road leading there was crowded at seven this morning with a dense line of carriages, while the footpaths were crowded with an endless throng, trudging manfully down to the river side. Take it altogether, I think the extraordinary interest created by these annual contests is a healthy sign of public feeling. I am by no means a believer in the "muscular Christianity" faith, and I do not hold that the spectacle of sixteen high-bred youths, straining every muscle for dear life in order to place one boat's nose a couple of yards before another, is the noblest spectacle on which the Creator of the universe had occasion to gaze upon the present day. But still, without exaggeration, it is, I think, a good thing that some couple of hundred thousand Londoners of all classes should get up before daybreak, and take a very long and wearisome trip, in order to be spectators of a boat-race not rowed for money, and on whose issue no great amount of money really depended. In its own way, however, the sight was one which could not have been matched elsewhere. The broad reach of the Thames near Mortlake was covered with a flotilla of pleasure-boats, dense masses of people lined the banks on either side of the stream, and the morning was bright and sunny for the first time for many weeks.

The race, as was expected, ended in the victory of Oxford. For nearly four miles the two wager boats struggled neck by neck, sometimes one drawing a few feet in advance, sometimes the other, amidst the hoarse shouts of the partizans of either crew; but at the finish the superior strength of the Oxford men enabled them to carry their boat in a winner. This is the sixth successive year during which Oxford has won the contest. My own belief is, that so long as rowing is so much the fashion as it is now at both universities, Oxford must always win, as the Isis is a river on which rowing can really be learnt, while the "reedy Cam" is little better than a ditch. Some years ago the Oxford undergraduates cared more for cricketing than they did for boating, and then Cambridge won the race for I forget how many years in succession. Of late years, too, drilling for volunteers has been the peculiar hobby of the Cambridge lads; and the interests of rowing have suffered in consequence.

Which will win, the dark blue or the light, has been the question of the week, and for one person who has talked about the reform bill, there have been twenty, in London at any rate, who have talked of nothing but the boat-race. Another of the intervening weeks between the first and second reading of the bill has passed away, and there has not been any indication whatever of popular excitement. At Leicester alone has there been a public meeting held in its support; and at this town the sitting members, who are Liberals of the most advanced character, declined to attend the meeting, probably because they felt the gathering was not likely to be an influential one. The partizans of the measure congratulate themselves on the fact that there was no indication of public excitement about the reform bill of 1832 till some time after its introduction; but it seems to me that in politics as well as in the atmosphere a dead calm is not invariably followed by a tempest. Meanwhile, the persons who have most interest in forming a right estimate are convinced that the public apathy is genuine, and not merely apparent. As I have before told you, there are a very large number of Palmerstonian Liberals who would be only too glad to vote against a reform bill, if they were not afraid their votes might entail the loss of their seats in the event of an appeal to the country. As the days go by, and the out-door public continues to express no interest about reform one way or the other, the faint-hearted Liberals are beginning to speak out more boldly. And at last what is commonly regarded as the death-blow to the bill has been dealt by the hand of a Whig of the Whigs. Early this week notice was given by Earl Grosvenor that, on the second reading of the bill, he should move a resolution that the question of lowering the franchise must not be dealt with separately from that of the re-distribution of seats. The resolution, which is said to have been drawn up by Mr. Disraeli, and which is to be seconded by Lord Stanley, is ingeniously framed. The most ardent professed Liberal might declare that re-distribution and enfranchisement should go together without explicitly breaking any pledge he may have given to support reform. Yet the passing of this resolution will be as fatal to the bill as if it was directly thrown out upon a vote of want of confidence. Moreover, the standing and position of the mover of the resolution give it peculiar significance. Lord Grosvenor is the eldest son of the Marquis of Westminster, the richest and, next to the Duke of Bedford, the most powerful of the great Whig nobles. The whole of Belgravia pretty well belongs to the house of Westminster. Every year the leases on this estate are falling in, and the marquis re-enters on the possession of the innumerable mansions for which hitherto he received only a ground-rent. Some years ago his income was estimated at a thousand pounds sterling a day, and, as the Grosvenor family are celebrated for economy, the annual increase of the rental must be something stupendous. There are at least a dozen seats in the House the elections for which can be decided more or less completely by the Grosvenor influence; and even the great historic borough of Westminster is yearly falling more and more under the influence of the Grosvenors. Then, too, it is absolutely certain that Lord Grosvenor has not resolved to detach himself from the ministerial cause without consultation with the class to which he belongs. This defection means the defection of the Whig aristocracy; and, as such, is a terrible blow to the Ministry. Every day some fresh deserter from the Government benches announces that he cannot find it consistent with his principles to support the bill; and last night being the last night before the recess, Mr. Disraeli resumed once more the old tone of insolent triumph which he has laid aside so long, but which he always adopts when he feels he is fighting a winning battle. Englishmen bet about everything, and since the announcement of the Grosvenor resolution the odds against the passing of the bill are quoted at about ten to one, taken freely.

Every day, almost, Cabinet councils are being held, and the Government is utterly at its wits' end what to do in the face of a hostile Parliament and an indifferent public. There is said to be a division of opinion about the course which ought to be adopted. The Duke of Somerset, Lord Granville, and others would, it is supposed, advise the withdrawal of the bill on the understanding that next session the Government should pledge itself, in obedience to the wishes of the House, to bring in a complete and comprehensive bill. On the other hand, Earl Russell and Mr. Gladstone are opposed to any compromise, and are so far firm in their resolution to fight the bill against all and every opposition. Of course the friends of the Government declare that, in the case of a ministerial defeat, the Premier will ask the Queen's permission to dissolve Parliament. The threat of so doing is the most powerful weapon the Ministry can use to keep their followers together. But if the occasion should actually arise, I suspect the question of dissolution or no dissolution will be decided by the extent of the majority against the bill and the manner in which its virtual rejection is received by the country.

Personally, I do not think the probable rejection of the bill is any great public misfortune. I am one of the few English Liberals who have the courage to own that I distinctly wish the government of the country to be made more democratic. And this end will be brought about more surely, I fancy, by the failure of the Government measure than by its success. After such a fiasco, we shall probably hear no more of reform for some time to come; but the masses will learn from its failure that they will never obtain political power without agitation; and, whenever a period of distress and discontent arises, we shall have a popular outcry for a measure which will alter the whole character of our representation. Moreover, I confess to a sense of poetical justice being satisfied by the downfall of this reform movement. During the whole of the period of the English fashionable pro-Southern sympathies, I wearied myself with trying to convince my Liberal friends that they were undermining their own cause. For four years our leading Liberal politicians and journals preached constant homilies upon the horrors of democracy and the downfall of democratic institutions; and now they are astonished because their lessons have taken effect and the public are not enthusiastic about a reform which, if it has any meaning at all, means a movement towards democracy. I have seen it often stated in the *Star* that the triumph of the Union has given an immense impetus to the progress of democratic principles in England. In the long run I believe this statement will be found to be true, but

t is not so for the present. The English mind does not take in new ideas readily, and the fact that the Union is really restored has hardly worked its way to popular English perceptions. For the present, I believe, we are still under the influence of the "conservative reaction" created by the American war.

To-night is Mr. Jefferson's last appearance at the Adelphi in the character of *Rip Van Winkle*, after a run of one hundred and seventy-four nights. He goes into the provinces, and returns after some weeks' absence to come out in a new play. Altogether, his success in this country has been the most brilliant that has happened for many years in the London theatrical world.

PARIS GOSSIP.

PARIS, March 20, 1866.

A SINGULAR event took place not long ago which is creating considerable sensation in our fashionable circles. However improbable the story may seem, I am assured of its authenticity, and give you here the true version of it. Near the Palais de l'Industrie in the Champs Elysées is the stall of a woman who deals in maccaroons. This stall is the centre of attraction for nurse-girls and school-boys, who come and stake their *sous* at a species of *rouge-et-noir* table. The winner gets his cakes for nothing, whilst the loser forfeits the amount staked. Not long ago two gentlemen on horseback, followed by their grooms, stopped opposite this stall, where they dismounted and, going up to the small table, began the following conversation in French, although with an accent which left no doubt as to their transatlantic origin:

"It is understood then, J——, that you take the black?"

"Perfectly."

"For my own part I have a predilection for red."

"How many times shall we throw?"

"Ten."

"Madam," said Mr. J——, "I will begin. You hear that I have chosen the red. Have the kindness to keep account and tell us the result of the game." The game commenced. Mr. J—— won twice and lost eight times. The other won seven times and lost three.

The poor woman was at first terrified at her great loss; but what was her surprise when the two gentlemen threw each a five-franc piece upon the table and, without waiting either for change or cakes, left the spot!

This scene was renewed nine successive days with the same result as to the game. On the tenth day our two Americans again appeared at about the same hour.

"I presume," said Mr. J——, "that you have kept an account of the result of our nine days' meeting?"

"Certainly," replied his antagonist.

"How do we stand?"

"Strange to say, we have both won and lost the same number of times. Does your account tally with mine?"

"Perfectly."

"Then to-day's play decides the question?"

"Exactly. Will you begin?"

"You are very kind; I will follow you."

In spite of the courtesy of this dialogue, the bystanders who had been attracted to the spot by the singular scene fancied they noticed a bitterness in the tone in which the words were uttered. The two players were as pale as death, and, although the weather was cold, drops of perspiration stood upon their foreheads.

Mr. J—— played, and lost seven times. His companion won twice and lost eight times.

"I have lost," said the latter, "and you shall be satisfied."

They then paid the woman as liberally as before, and, bowing politely to each other, left the spot.

Four days after this the following paragraph appeared in the daily papers:

"A suicide committed under the most inexplicable circumstances has just thrown an air of sadness over one of the most aristocratic quarters of Paris. A young foreigner, Mr. ———, endowed with every gift of fortune, was found dead in his bedroom yesterday morning, a bullet having passed through his brain. All enquiries as to the cause of this unhappy suicide have proved fruitless, and it is supposed that the young gentleman committed the act whilst in a state of mental aberration."

This was all the light that was thrown upon the circumstance at the time, but since the following details have transpired. These young gentlemen, Americans, came into joint possession of an immense fortune by the death of a distant relative. They agreed to come to Paris together and enjoy life. On arriving here they put up at the same hotel and lived for some time together. After a while, however, a coldness sprang up between them and they eventually quarrelled. The quarrel led to the singular scene described above, and the sad catastrophe which followed it.

A very curious and somewhat mysterious marriage took place in one of our *mairies* a few days back. A most elegantly dressed and highly aristocratic English lady, aged twenty-two, was married before one of our mayors to a French gentleman the other side of sixty. After the ceremony the English lady stepped into a magnificent carriage drawn by four *alezans* and, with her *femme de chambre*, drove off to the station of the Northern Railway. The gentleman returned to his modest lodging on a fifth floor, carrying in his pocket an *inscription de rente* in the French funds for £50 a year. This extraordinary event has given rise to a great many surmises as to the lady's name and her motive for contracting such a singular marriage. As you may suppose, the lady has been the object of many uncharitable remarks.

One of the celebrities of the day, General Jusuf, knight of the Legion of Honor, has died at Cannes. The early life of this remarkable personage belongs rather to fable than to history. It is said that he was born in the Isle of Elba. He entered the French army when only twenty-two years of age, at which time he was a great favorite of the Bey. As in the story in the "Arabian Nights' Entertainments," the humble slave raised his eyes to the Princess Kabousah, daughter of Bey Hussein, and Kabousah, like the princess in the same story, deigned to look upon him with favor. Unfortunately, there were many obstacles to their union. One day the lovers were betrayed by a slave, who, however, paid dearly for his imprudence. Passing Jusuf's door, on his way from the Bey, Jusuf dragged him into his room. Two hours afterwards the princess received a basket of flowers, and on removing the flowers found underneath them a human hand, a tongue, and an eye, with a note containing the words, "I send you the eye that watched us, the tongue that betrayed us, and the hand that denounced us." Jusuf had to flee while waiting for the princess's reply. Since that time he has distinguished himself in many remarkable engagements, and, by his bravery and intelligence, attained the rank of general, together with numerous other distinctions. His death is deeply regretted by all who knew him.

An incident occurred night before last at the opera, which brought the performance of "La Juive" to a somewhat stormy close. It appears that M. Villaret had sent word to say that, owing to sudden indisposition, he would be unable to take his part in the opera that evening. M. Perrin replaced Villaret by M. Mathieu, who had long solicited an engagement. M. Mathieu had already appeared as *primo tenore* upon many of our provincial stages, but it appeared that he was unequal to the boards of the grand opera; above all, he had to labor under the great disadvantage of not having gone through a rehearsal or tried his voice in the orchestra. It is difficult to say whether M. Mathieu is deficient in talent or not; but this much is certain, he is not deficient in courage. Laboring under the disadvantages already mentioned and the emotion naturally felt at appearing before a Parisian audience, M. Mathieu broke down in the fourth act, and the curtain fell amid a storm of hisses and other expressions of disapproval. The curtain rose for the fifth act, but the uproar was so great that the performance could not go on. At shouts of "*A la porte les claqueurs*," the claqueurs left the house, and the director appeared and was received with shouts of "Return the money!" The money, however, was not returned, and Halévy's immortal *chef d'œuvre* was wound up with the "Femme à barbe," sung in chorus by the more turbulent of the spectators.

Speaking of *chefs d'œuvre* reminds me of an anecdote I heard to-day. Rossini was at his piano, evidently engaged in deciphering the "Tannhäuser." A visitor arrived and seated himself behind the composer.

"Maestro!" exclaims the visitor, "you have got the work upside down."

"Yes," good-humoredly replied the author of "Guillaume Tell," "I tried it the other way, but that would n't do."

Victor Hugo's new novel, "Les Travailleurs de la Mer," has appeared, and is a great success. Five thousand copies of the work were sold on Tuesday and Wednesday alone by the publishers, Messrs. Lacroix & Verboeckhoven. The price is eighteen francs, consequently the publishers have already received 90,000 francs. The copyright for ten years was purchased for 120,000 francs. Contracts have been made for translating it into ten languages.

In the musical world the celebrated Abbé Liszt is the lion of the day, and no fashionable circle is considered complete without his presence. On Friday he was at Prince Metternich's, who, by the way, proved himself recently to be a first-class pianist. Liszt was asked to seat himself at the piano; but it was a long time before he could be induced to do so, and then only on condition that he should not be asked to play a note of his own music. He confined himself to merely accompanying Leonard, the famou

violinist, in the execution of one of Schumann's pieces. The abbé's musical mass was executed at the church of St. Eustache on Thursday. An hour before the mass began every seat in the church was filled. This mass was performed for the first time at Pesth about eight years ago, on the occasion of a great solemnity at which the Emperor and Empress of Austria were present. The abbé himself played the organ several times on Thursday, and executed, among other pieces, Mendelssohn's triumphal march. Among the distinguished persons present I noticed M. Auber, General Mellinet, M. Berlioz, and M. Duruy, our Minister of Public Instruction.

Mademoiselle Patti is to appear this week for the first time in the "Elisir d'Amore." Every place at the Italiens is already secured. Faure, our celebrated baritone, has accepted an engagement for five years at the Imperial opera for a sum of 90,000 francs a year. One of the conditions of the engagement is that he shall not play in London during that time.

We are threatened with a complete inundation of new pieces at our various theatres. The favorite of the day, however, seems to be Don Juan, as our "well-known hero" is about to figure at no less than four of our theatres. Among them we are to have a "Don Juan du Village," by Madame George Sand, at the Vaudeville.

The Odéon presented a very brilliant appearance on Saturday, when Emile Augier's new piece, "La Contagion," was performed for the first time. The theatre was filled with all our great celebrities in art, literature, and politics. Time will not allow me to give you a sketch of this curious piece, but I will do so in my next. The Emperor and Empress were present. Their arrival was hailed with the usual enthusiastic shouts, mingled with cries of "*Vive le Luxembourg!*"

Our artists are working the flesh off their bones in order to have their pieces ready in time for this year's exhibition. To-morrow is the last day for sending them in. Not a painter or sculptor has been seen on the Boulevard before dusk for several days. They are all shut up in their *ateliers*, preparing for the 20th. One of our famous painters suddenly disappeared a short time back, and has not been seen or heard of since. I am told that he has yet a ticket upon his door with the following inscription: "I am not in."

A journalist and great collector, M. Cheron de Villiers, the author of an important work on Charlotte Corday, has just discovered twenty-eight autograph letters of that famous lady. They were written between the years 1790 and 1793, and are addressed to her friends. They all pertain to historical and political questions.

The following was recently discovered, and as I have been fortunate enough to pick it up before any of the French papers have got hold of it, I send it you. The name of Fouquier Tinville, the famous public procurator of the revolutionary tribunal in 1793, and who was one of those who signed Louis XVI.'s death-warrant, is familiar to every one. But few are aware that when the treaty of peace with England was signed by that unhappy monarch, Fouquier addressed eulogistic verses to the king, and that these verses still exist. They read as follows:

"D'une profonde paix nous goutions les douceurs,
Même au milieu des fureurs de la guerre,
Louis sut en touts temps la donner à nos cœurs!
En l'accordant à la fière Angleterre
Louis admet ses ennemis
Au rang de ses enfants chéris.
Sous l'autorité paternelle.
De ce prince ami de la paix
La France a pris une splendeur nouvelle
Et notre amour égale ses bienfaits!"

Fancy such lines from such a man!

Correspondence.

TOWLE'S HENRY V.

To the Editor of The Nation:

I am grateful to your critic for the courteous and kindly manner in which he has received "Henry the Fifth." The weight which his review will justly carry with it, by reason of its evidence of ripe scholarship and of its spirit of fairness, induces me to notice one or two points which he has made. And first, in justice both to him and to the public, I am constrained to acknowledge several errors in the book which his sagacity has discovered and pointed out; which I do the more readily as he has not repelled admissions by that undignified discourtesy of tone by which would-be critics strive to build up a reputation; he has rather invited them by a spirit of fairness and kindly frankness which befits the capable censor of literature.

Henry the Fourth did, as he says, base his claim to the crown upon a pretended descent from an elder brother of Edward the *First*, and not, as incorrectly stated in the history, from an elder brother of Edward the *Second*. Mary de Bohun was, as he says, born in 1394, and I have given this date correctly on page 160 and incorrectly (1404) on page 161. Joan of Navarre was not, as he has truly indicated, a daughter of the King of Aragon, and she married Henry the Fourth in 1402, not in 1405, as I have stated. These are all the errors in dates, I believe, which he has pointed out, and I now admit them with a view to making reparation, merely saying that the difficulties of getting every date right, when there are so many to look after, are greater than those who have not written upon matters of history imagine.

But I would, in the same kindly spirit which pervades his review, call attention to two points which he has made, and justify the position of the history in regard to them. The critic says:

"Mr. Towle starts with an error on his very title-page. Henry the Fifth was not 'heir of France,' as Mr. Towle himself is at particular pains to show." "The only reasons for calling Henry the Fifth 'heir of France' are to be found in the arrangement that was made that he should succeed Charles the Sixth as king of that country, which came to nothing, and depended for its worth upon the event of the war."

I have, indeed, endeavored to show that Henry had no real claim upon the French crown. But I think that my calling him "heir of France" is to be justified, and upon this ground: Henry succeeded in conquering the French armies and in making a treaty with Burgundy, Isabella, and Charles. In that treaty, called the treaty of Arras, the fifth and sixth provisions explicitly stipulated that Henry should be *regent* of France during Charles's lifetime, and that upon Charles's decease *he should succeed to the French crown, and his heirs for ever*. Was he not thus recognized as *heir* of France by the French themselves? Did he not enter Paris by the side of the French sovereigns, the acknowledged heir to the crown, and absolutely administer the government as regent? And was he not so recognized by the court and the parliament of Paris from that time (December, 1419) up to the day of his death (August, 1422)? Was he not then really "heir of France," not so merely by the record of the privy council, but also by the express confirmation of the French and by his practical assumption of the duties of regent? Herein lies the difference between his case and those alluded to by the critic, of the modern kings of England and Sardinia.

Again, the critic says the Wars of the Roses "never would have taken place had John of Gaunt been the second or even the *third* son of Edward the Third. Had he been the third son he would have been the heir presumptive of Richard the Second, and his son, Henry of Bolingbroke, would have succeeded to the place, and would have been entitled to the crown, failing heirs of Richard the Second."

Is this so?

John of Gaunt was, indeed, strictly speaking, the *fourth* son of Edward the Third; but he was, as far as the events of history were concerned, his *third* son. The sons of Edward were Edward, Lionel, William, John of Gaunt, as your critic says; but William, dying in childhood, left no children, and made no mark whatever on the events of his time or family, and by his early death he left John of Gaunt practically the third son. Supposing William had never been born (for his existence had no effect on the dynasty whatever), then John of Gaunt would have been the third son. In that case, would he have been heir presumptive of Richard? Does not the critic overlook the fact that the heirs of Lionel, the second son, lived, and were Richard's heirs? Is it not apparent that John of Gaunt, if he had been really the third son, as he was to all intents and purposes, would no more have been heir presumptive than if he was the fourth son? For the descendants of Lionel would in either case come in before him and his descendants. The critic, then, it seems to me, has made an error in saying that had John been the third son the Wars of the Roses would not have ensued. He was practically the third son, and Hume (Vol. 2, p. 266) calls him so, on the ground that the son who died in infancy, having no influence upon the dynasty, need not be counted. The Wars of the Roses were kindled by the heirs of Lionel, Edward's second son, against the usurping Lancasters, who were descended of John of Gaunt, to all interests and purposes his third son.

By giving a place to this in your columns, you will aid us in arriving at the real historical facts; and historical truth, I believe, both your able critic and myself are sincerely desirous to establish.

Yours, very truly,

George M. Towle.

Boston, March 26th.

[There are but few points in Mr. Towle's letter which call for reply. We adhere to our opinion that Henry the Fifth was not "heir of France." The arrangement made that he should succeed Charles the

Sixth only provided that he should be Charles's *successor*—which, in fact as well as in law, is a very different thing from heir; and the fact in this case depended for its practical usefulness upon the event of war. It was beyond the power of Charles the Sixth to make Henry the Fifth "heir of France." Such an arrangement was forbidden by the fundamental law of the French monarchy, which was appealed to by French statesmen three centuries later, at the time the Spanish succession was under discussion; and there was not a publicist in Europe at the beginning of the eighteenth century who believed that Philip of Anjou would refrain from pressing his right to the French crown were that prince to die young who subsequently became Louis XV. The question was one which the sword alone could decide, and no renunciation of his birthright by Philip could have been of any avail. If such was the fact with regard to an arrangement to which Philip was a party, how much stronger was the case with regard to that arrangement which was made by Charles the Sixth and Henry the Fifth, and to which the legal heir to the French throne was not only not a party, but which he was in arms to resist, and did resist until he had regained his inheritance, making good by force what was his legally and morally—becoming king *de facto* as long before he had been king *de jure?* That Henry would have become *king* of France, had he lived, under the terms of the treaty of Troyes, is highly probable; but that that treaty depended for its practical value upon the course of military events, is a point which cannot reasonably be disputed. How far the military situation was from being entirely favorable to the arrangement made at Troyes, appears from the utter defeat of Henry's party at the battle of Beaugé, one of the most spirited and bloody actions of that warlike time. That battle was fought almost a year after the treaty of Troyes had been agreed upon. Other successes had attended the resistance of the French, and the issue was yet uncertain when Henry was removed from the great scene by death; and those who succeeded to his power were unable to do his work, though it has always seemed to us that his brother John, Duke of Bedford, was an abler man than the king. But even had there been no resistance made to Henry's claim to reign after Charles the Sixth's death, and the Troyes arrangement had been satisfactory to all parties, the English monarch would not have been "heir of France." Henry the Fifth then would have become Charles the Sixth's successor, or devisee, nothing more. It is a very ancient maxim that an heir can be made only by God.

Mr. Towle questions the correctness of our assertion that John of Gaunt would have been Richard the Second's heir presumptive had he (John of Gaunt) been "even the third son of Edward the Third," and points to the circumstance that heirs of Lionel, an elder brother of John of Gaunt, were living, and had superior claims to those of the Duke of Lancaster. There would be force in what he says had John of Gaunt been Edward the Third's third son, as in that case he would have stood above Lionel, Duke of Clarence. John of Gaunt *was* the fourth son of Edward the Third, and all our remarks on this part of the subject were based on the admission of what is a well-known historical fact. William, second son of Edward the Third, has a place in history, though his life was a brief one; and we could cite from twenty standard historians to show that John of Gaunt is spoken of as the fourth son of his renowned parents by those who are authorities on the subject. As our remarks showed, we had the Clarence claim in our mind when we wrote on that entangled point of history, the respective claims of the houses of York and Lancaster to the English royal succession. This matter is one of fact and not of opinion, and not even so able a man as Hume—who cannot be named as an authority for facts—can be permitted to set aside the commonplaces of history. If we were to admit that such changes ought to be made, we should have the right to demand that they be so made that all shall recognize them. Mr. Towle looks upon John of Gaunt as having been, practically, the third son of Edward the Third, and therefore thinks he has discovered an error of fact in our observations. We hold that he was his father's fourth son—and even Mr. Towle admits that he had three brothers older than himself—and therefore believe we were guilty of no error of fact. We are satisfied with our position, and we presume that he is satisfied with his. Were we capable of making the gross mistake he attributes to us, we think we should have sufficient modesty not to speak of any less striking errors into which he has fallen. To us Mr. Towle's view seems to be as unfounded as Henry the Fourth's claim to the English throne because of his descent from an elder brother of Edward the First.

We sympathize with Mr. Towle in what he says about the difficulties of getting all dates right, and how easy it is for a writer to make a slip is proved by a mistake he falls into in his letter. He represents us as saying that Mary de Bohun was "born in 1394." We said that she died in that year. She was Henry the Fifth's mother, and is of no importance in history; but if her death had not taken place until 1404, it is quite probable that she would have become an historical personage of some note; and the circumstance that her husband sought one woman in marriage in or near 1399, and married another in 1402, made it proper to set the fact right.—Ed. Nation.]

MR. DICEY'S 50,000 FRENCHMEN.

To the Editor of The Nation:

In a letter published in The Nation of last week Mr. Edward Dicey explains an observation of his in his "Federal States," of which I made passing mention in the London *Spectator*, that "a French army of 50,000 men might march from New York to New Orleans and defeat any force it met on its path." Mr. Dicey's desire to relieve himself from the position in which he is apparently placed by this assertion is certainly natural, considering his good sense and the opportunity he has had since he was here for reflection and observation upon the subjects of his book in question, which, it gives me pleasure to say, is written with a nearer approach to perfect candor and accuracy than any modern book of travel in this country that I have met with. Mr. Dicey, however, does not, it seems to me, at all do away with the point, such as it was, that I made in regard to his statement. For he repeats in his letter, "I believed then, and I believe still, that in 1862 50,000 French troops would probably have defeated any force that either North or South could have brought against them at one point." Now I did not presume, and do not presume, to say that they could not. I only said that in that case we had one reason to be glad that they would now probably not attempt to do so. As to Mr. Dicey's plea that his remark rested upon his "belief that untrained volunteers are not a match for trained troops," he surely does not need to be told that that belief is universal here among all people who have even a modicum of common sense. And as to the support which he implies is given to his opinion "by the triumphant march of Sherman's veterans in 1865," that march would have supported Mr. Dicey if Sherman had been resisted, or if there had been enough men left upon his route to organize themselves into a body sufficiently strong to make a passable show of resistance. This, as we all know, was not attempted. It does not need one to rise from the dead, or to come from England, to tell us that 50,000 Frenchmen, or 50,000 Chinese, could march from New York to New Orleans if their march was not contested.

Let me correct for Mr. Dicey a strange typographical error in his letter as it appeared both in The Nation and the *Spectator*. He is made to say that he did not mean to indulge in "a silly sneer against the *learning* of American *newsmen*." This staggered me for a moment, until I saw very plainly that Mr. Dicey had written "against the *courage* of our American *kinsmen*."

A Yankee.

New York, April 6th.

[How the error occurred in The Nation as well as in the *Spectator* is explained by the fact that Mr. Dicey forwarded us the body of his letter in the print of that journal, with merely formal alterations.—Ed. Nation.]

Literature.

LITERARY NOTES.

The late George L. Duyckinck, known in American letters by the "Cyclopædia of American Literature," which he edited in connection with his brother, Mr. Evert Duyckinck, and by a "Life of George Herbert," edited an edition of Shakespeare, which is now on the eve of publication in Philadelphia by a firm which is new to us, Messrs. Davis, Porter & Coates. It will make an imperial octavo of eleven hundred pages, which will be illustrated by the Droeshout portrait, the one of all others which has the greatest claim to authenticity, besides the endorsement of Ben Jonson, a view of Stratford, and a full-page illustration to each play, engraved from designs by T. H.

Nicholson, and printed in tints. Mr. Duyckinck's editorial labors consist of a new life of the poet, a history of the stage, introductions to the different plays, and a selection of notes and references from previous editors and commentators. The best feature of the edition is its presentation of the different readings of corrupt passages from the early folio and quarto copies, the blunders of which sometimes help the reader to the poet's meaning when it is not perceived by his editors. The work is to be published by subscription.

—Messrs. Hurd & Houghton have in preparation a volume of Arctic explorations by Dr. Isaac I. Hayes, commander of the expedition in 1860–61, which is likely, when published, to attract a great deal of attention. If we knew the present condition of that very changeable chameleon, public curiosity—whether or no it was still interested in Polar discoveries—we might venture a prediction on the success of Dr. Hayes's work, which ought to be as widely read as was in its day the kindred work of the late Dr. Kane, who left a daring successor behind him in Dr. Hayes, to whom must be awarded the palm of going further north than any other known explorer. His volume, which will be about the size of Dr. Kane's, is to be illustrated from designs by some of our best artists, notably by Church and Darley. We have seen two illustrations by the latter—a party of explorers attacked by white bears, and another party in a boat, in a sea of ice, surrounded by swimming seals—and can praise them heartily. Effective like most that Darley does, they are well thought out and drawn with great care and spirit.

—The circulation of books of a certain class, mostly bearing upon the late war, exceeds anything ever before witnessed in this country, with the exception of "Uncle Tom's Cabin," and a few of our most popular school-books. One of these publications, the scribblement of a woman who, we believe, was a hospital nurse, or something of the sort, has already netted a large fortune for its publisher, who circulated it through women agents. We forget the exact circulation of Mr. Greeley's unfinished work on the war, but it was very large. Of two later works which, like that, are sold only by subscription, "Sherman's Campaigns" and Coppée's "Life of Grant," it is within our knowledge that fifty thousand copies of the former were sold in four months, and twenty thousand of the latter in about half that time, which suggests the reflection that the next best thing to being a military hero is to be the publisher of his exploits. It would be curious to trace the sale of such works, since it would enable us to form an estimate of the mental proclivities of the people of the different States. That they circulate but little in our great seaboard cities we take for granted, from the fact that the matter they contain was long since made known to us by the papers of the day and the bulletins of the hour; besides, we are tired of wars and rumors of wars, and seek forgetfulness and amusement, some in the last new novel, others in magazines and periodicals, and others at the theatre and the opera. In the country, where these things are not, it is different. The interior of New York is said to be a rich field for peripatetic venders of war-books; also the region west of the Alleghanies. They are, likewise, beginning to venture a little in the South, chiefly along the edges of the border States.

—Messrs. Scribner & Co. have not been idle during the dearth which has crept over the trade for the past three months, as may be seen by their announcement of books in press, which is the largest that we have to chronicle at present for any one house in the city. It embraces four new works and three instalments of works already in progress, viz.: "Short Sermons to Newsboys, with a History of the Formation of the Newsboys' Lodging-House," by C. L. Brace, 1 vol. 16mo; "Temperance Recollections, Labors, Defeats, and Triumphs, an Autobiography," by the Rev. John Marsh, D.D., Secretary to the three first National Temperance Conventions, and thirty years Corresponding Secretary and Editor of the American Temperance Union, 1 vol. 12mo; "Patriotic Eloquence: Being Selections from One Hundred Years of National Literature, Compiled for the Use of Schools in Reading and Speaking," by the late Mrs. C. M. Kirkland, 1 vol. 12mo; "Life of Benjamin Silliman, M.D., LL.D., late Professor of Chemistry, Geology, and Mineralogy in Yale College, Founder and Editor of the 'American Journal of Science and Arts,' etc.," by George P. Fisher, professor in Yale College, 2 vols. crown 8vo, with a portrait and other illustrations; the "Second Volume of Lange's Commentary," containing Mark, edited by the Rev. W. G. T. Shedd, and Luke, edited by the Rev. C. C. Starbuck; the fifth and sixth volumes of Froude's "History of England, from the Fall of Wolsey to the Death of Elizabeth," crown 8vo; and part second of Stanley's "Lectures on the History of the Jewish Church, from Samuel to the Captivity," 1 vol. 8vo.

—Mr. S. P. Avery, at No. 695 Broadway, will shortly publish a valuable architectural monograph. Architectural monographs have been rare in this country, as have books of any kind treating of architecture, and with good reason. The partial completion of so important a building as that of the Academy of Design is fitly marked by the appearance of this work. The title describes the book: "National Academy of Design—Photographs of the New Building, with an introductory essay and descriptions by P. B. Wight, architect." There are fifteen very beautiful photographs, one of the whole building, and the others of details, principally of the exterior carving. The book is a thin folio; the photographs are taken by Mr. Stadtfeldt, the letter-press is Alvord's, and it is bound in half morocco. The edition is limited to one hundred copies.

—The South, we are happy to perceive, is turning its attention to letters, if only in a small way; if it had published more, and talked politics less, for the last thirty years, it would have been better for all parties. We note, therefore, a couple of new publications by Wm. B. Smith & Co., of Raleigh, N. C.: "Mosses from a Rolling Stone," by Tenella (Mary Bayard Clarke), author of "Reminiscences of Cuba," "Wood Notes," "Translations of Marguerite," "Lady Tartuffe," etc., and "Nameless: A Novel," by Fanny Murdaugh Downing. The first of these volumes, which is a collection of verse, is described by one of our contemporaries, not remarkable for critical acumen, as "characterized by a graceful and flowing versification, a pleasing play of fancy, a beautiful and tender sentiment;" of the second the same authority says: "The characters of the story are clearly individualized, and their varying fortunes are often illustrated with passages of thrilling interest."

—The fame of Shakespeare is greater, if possible, in Germany than in England, the writers of the former country, from Goethe to Gervinus, displaying, with an equal knowledge of his text, a profounder analysis of his motives and characters. The Tercentenary Celebration, for instance, which in England accomplished nothing, but which here and in Germany was productive of solid results, has established there a Shakespeare Society, supported by scholars and critics, who are pledged to furnish yearly one volume devoted to the treatment of Shakespearian themes. The first of these "Year-books" contains several papers of special interest, the editor, F. Bodenstedt, discussing Chapman's relations to Shakespeare, while those of Marlow are considered by Ulrici. Delius subjects the enigmatical sonnets to a close analysis, and arrives at the conclusion that they possess no biographical value; Dr. Koberstein traces the history of Shakespeare in Germany; M. Bernays attacks and carries Rio's unsubstantial notion that Shakespeare was a Roman Catholic; Karl Elze handles the French translations of Hamlet; F. A. Leo discusses some of the proposed emendations of the text; and A. Cohn furnishes a Shakespearian bibliography for the last two years, which includes papers in the reviews, and even slight communications in magazines and journals. Altogether, the German Shakespeare Society has begun well.

—No book of European translation has ever been so popular in China as that of "Euclid's Elements," the first six books of which were done into Chinese by the Jesuit missionary Matteo Ricci, with the help of a native convert, named Seu Kwang-ke, and published in 1608. The science was new to the Celestials, although they had studied, and written largely upon, astronomy and kindred subjects; the title of the work, "Ke hô guên"—in English, "the science of so much"—could have conveyed no clear idea of its purport to them, though it has since been so naturalized that it is now readily understood, even in their literary writings. It passed through a number of editions—two in the lifetime of Seu, who, in the second, expressed his regret that it was incomplete, and a hope that the remaining books would be added, a labor which seems to have engaged the attention of Father Ricci, who, in another work, quotes from the eleventh and twelfth books; his death, however, in 1610, prevented its completion. The want of the remaining nine books was felt at a later period by Mei Wuh-gan, a noted Chinese mathematician, who endeavored to supply the deficiency from his own powers, and published a "Supplementary Treatise on Geometry," "Trigonometrical Demonstration of the Elements of Geometry," and "Important Selections of Geometry." A contemporary, Mei Urh-soo, published a "Systematic Investigation of Geometry." Later, in 1631, Jules Aleni, a Jesuit missionary, published "Essentials of Geometry;" he was followed by T'ang Wei-pih, with a "Summary of Geometry," and by Too Twan-foo, in an "Abridgment of Geometry." At the beginning of the last century the general principles of plain and solid geometry were given in what may be called an Imperial Cyclopædia, with a section containing the most important problems of the seventh, eighth, and ninth books of Euclid; an abridged edition of this treatise was issued some fifty years later, under the title of "Main Points of the Elements of Geometry." There was no complete Euclid, however, in Chinese, no translation of the much needed nine books, until 1858, when they were undertaken by Mr. A. Wylie, who was assisted by a native scholar, like Father Ricci before him. A few copies of his trans-

lation were printed from the blocks, when the house was destroyed by the rebels—which circumstance, joined to the death of its proprietor, delayed the work until recently, when it was published by Tsang Kwo-fan, the Viceroy of Keang-sov, Keang-se, and Gan-hurey.

—While on the subject of Chinese literature, we must mention the translations, by Dr. James Legge of the London Missionary Society, of "The Chinese Classics," the third volume of which, a thick quarto, of between seven and eight hundred pages, was recently issued at Hong Kong. Few students of Chinese are unacquainted with the translations of Dr. Legge, whose labors are second only to those of Morrison in the translation of his great dictionary, which they surpass in some respects, being, mentally, of a higher order. Dr. Legge's third volume contains the first parts of the "Shoo King," viz., the books of Fang, of Yu, of Hea, and of Shang, with a prolegomena, and the fifth book of the "Shoo King" or the books of Chow. The prolegomena is especially well done, its deep and toilsome research entitling it to rank among the masterpieces of German scholars on the Greek and Latin poets. Dr. Legge has ransacked all authorities for facts in regard to this ancient Chinese record, tracing the sources whence it sprang, the history of its transmission to our times, in spite of the burning of the books, and the history of the principal commentary upon it. He analyzes the Bamboo Books, the earliest records of China, and gives a comprehensive sketch of the origin of the Chinese race. Thus much concerning Dr. Legge's labors on the "Shoo King." For the collection of which it forms a part, we are glad to announce that an American edition of it is in preparation, under the editorial care of Mr. Baker, of the Public Library, Worcester, Mass. The first volume, which will contain the "Confucian Analects," "The Great Learning," and "The Doctrine of the Mean," is to be published during the present month. The text followed is, of course, that of Dr. Legge.

—Among Oriental works whose loss scholars have deplored was one by Masoudi, the Arab historian, "Akhbar-az-zeman" ("News of the Times"), of which only a few fragments, and a summary made by Masoudi himself, were known to exist, under the title of "Muroudj-ez-zeheb" ("Golden Prairies"). In the latter work Masoudi constantly refers to the former, particularly on important matters as being there discussed at length—a circumstance which has piqued the curiosity of his readers and set them upon the trail of his missing volume, hitherto without success. We are now told, however, that M. Charles Ganneau, the editor of the philological department of the "Revue de l'Instruction Publique," has made the discovery that a perfect manuscript copy of it still exists in a library attached to the mosque of Mohammed the Second. Such being the case, it will not be long before it is translated into some of the languages of Europe, probably into French, since it is to a Frenchman that the discovery is due. What may be looked for in the "News of the Times," which were those of the tenth century, can only be conjectured, but, considering that Masoudi made extensive voyages to Persia, India, Ceylon, on the borders of the Caspian Sea, in Armenia, Spain, Africa, Madagascar, in China and the Eastern Archipelago, it can hardly fail to possess considerable interest for travellers and geographers.

—The third and fourth volumes of a French work bearing upon the early history of Canada have lately been published in Paris, both being reprints of old works published two centuries ago, and written by the same author, F. Gabriel Sagard Theodat, a French missionary of the Order of St. Francis, whose business it was to convert the Hurons and other aboriginal infidels. The first of these volumes, which was issued by Brother Gabriel in 1632, is an account of the voyage made by the missionaries from France to the Huron country. The second, which was published four years later, is a history of Canada and subsequent voyages thither for the same laudable purpose. Like most of the writings of the early Catholic missionaries, who, as a class, were as simple as they were shrewd, they contain a deal of odd and curious matter, a portion of which is of a character to make one smile.

—Lord Derby's translation of Homer seems to have incited the Greek scholars of England, some to present versions of their own, and others to the task of re-editing the Father of Poets. Among these last is Mr. Henry Hayman, B.D., who has just published the first volume of "The Odyssey," containing the first six books, with marginal references, various readings, notes, and appendixes. He has evidently studied the literature of his subject thoroughly, not only in the principal editions, which he could not help knowing, but in separate papers, tracts, and monograms, by foreign scholars, bearing on special points of criticism, of many of which he might well be ignorant, since their number is so large. He gives also an account of the old editors of and commentators on Homer, besides a list of the manuscripts of "The Odyssey," and their scholia. As regards the language of Homer, and the substantial integrity in which it appears to have descended to us, he believes that it was transmitted orally through generations of rhapsodists, and was written down at last rather as a help to their memories than to supply the supposed demand of a reading public, the existence of which at that early period is doubtful. That lines may have been interpolated he believes probable, holding that the structure of the Homeric sentences is such that the insertion or extension of a supernumerary clause *ad libitum* is a complement which they often bear gracefully, running, as they do, like the heroic chariot-team, loosely and at large; at the same time he thinks that it is hardly worth while to trouble himself, or his readers, with conjectures on such questions. Mr. Hayman's essays on the personages of Homer show him to advantage as a critic of ideal characters. The best of them is probably that on Pallas Athene, whom he describes as a character in the plot of both "The Iliad" and "The Odyssey," inseparable from their texture, and similar in its relation to the dramatic element to that of Mephistopheles in the first part of "Faust." "Her character," he says, "is without tenderness, or tie of any sort; it never owns obligation, it never feels pain or privation; it is pitiless, with no gross appetite—even that of sacrifice, conventionally necessary to a god, is minimized in it—its activity is busy and restless, its partizanship unscrupulous, its policy astute, and discrimination profound. It is keenly satirical, crafty, bantering; whispering base motives of the good, not afraid to speak evil of dignitaries, beating down the strong, mocking the weak, and exulting in her own easy superiority over them; heartless as regards true and tender affection, yet staunch to a comrade, touched by a sense of liking for its like, of admiration for its own faculties reflected, of truth to its party, ready to prompt and back its friend through every hazard—the divinity of human society, in short, a closer impersonation of 'the world' than any Christian (not to mention heathen) poet has ever produced."

VICTOR HUGO'S LAST NOVEL.*

"Religion, society, and nature," says M. Victor Hugo in his preface, "such are the three struggles of man. . . . Man deals with difficulty under the form superstition, under the form prejudice, and under the form element. A triple *anankè* weighs upon us: the *anankè* of dogmas, the *anankè* of laws, the *anankè* of things. In 'Notre Dame de Paris' the author has denounced the first; in 'Les Misérables' he has pointed out the second; in the present work he indicates the third."

Great programmes and intentions, even though they be *à posteriori*, are one of M. Victor Hugo's liveliest characteristics. It will, therefore, not surprise any of his old readers to find him calling what a writer less fond of magnificent generalizations would have been content to describe as "a tale of the sea," a picture of "the *anankè* of things." But M. Victor Hugo is a poet, and he embarks upon the deep in a very different spirit from the late Captain Marryatt. He carries with him provisions for a voyage all but interminable; he touches at foreign lands whose existence has never been suspected; and he makes discoveries of almost fabulous importance.

The scene of "Les Travailleurs de la Mer" is laid in M. Hugo's adopted home of Guernsey, or rather in great part in—yes, literally *in*—the circumjacent ocean. The story is a very small one in spite of its enormous distensions and inflations. An inhabitant of the island, the proprietor of a very pretty niece, becomes also proprietor, in the early days of the invention, of a very pretty steamer, with which he establishes communication with the coast of France. He employs as captain one Sieur Clubin, a man long noted on the island for his exquisite probity and virtue. One of his chief recommendations to the esteem of his employer is the fact that in former years, when the latter had admitted to partnership a person of doubtful antecedents, by name Rantaine, he had, out of the fulness of his integrity, divined this gentleman's rascality, and had forewarned his master that some fine day Rantaine would decamp with the cash-box. This catastrophe is, indeed, not slow in happening. Rantaine suddenly departs for regions unknown, taking with him fifty thousand francs more than his share of the capital. These three persons, Lethierry, the proprietor of the steamer, Rantaine, and the captain, Clubin, are all described with a minuteness very disproportionate to any part they play in the story. But when M. Victor Hugo picks up a supernumerary he is not wont to set him down until he has bedecked him with more epigrams, anecdotes, formulas, and similes than would furnish forth a dozen ordinary heroes. Lethierry is famous for his alacrity in rescuing the victims of shipwrecks. In heavy weather he paces the shore, scanning the horizon, and if he descries a craft of any species or degree in need of assistance, he is soon seen from afar "upright on the vessel, dripping with rain, mingled with the lightning, with the face of a lion who should have a mane of sea foam." After a day spent in this exercise, he goes home and knits a pair of stockings. He was a savage, says the author, but he had his ele-

* "Les Travailleurs de la Mer. Par Victor Hugo. A. Lacroix, Verboeckhoven et Cie., Bruxelles; F. W. Christern, New York. 1866."

gances. The chief of these is that he is very fastidious about women's hands. The reason that he had never married was probably that he had never found a pretty enough pair of hands in his own station of life. He brings up his niece, Déruchette, to take care, above all things, of her hands. About this young lady M. Hugo says an enormous number of extravagant and pretty things. We all know what to expect, however, when M. Hugo enters upon the chapter *jeune fille*. "To have a smile," he says at the close of a rhapsody on this subject, "which, one knows not how, lightens the weight of the enormous chain dragged in common by all the living, is—what else can I call it but divine? Déruchette had this smile. We will say more. Déruchette *was* this smile." Rantaine, the villain, is a most formidable creature. He is a mass of incongruities. He has been everywhere and everything. "He was capable of all things, and of worse." "He had passed his life in making eclipses—appearing, disappearing, re-appearing. He was a rascal with a revolving light." "He used to say, '*Je suis pour les mœurs*' —I go in for morals." Sieur Clubin is the reverse of Rantaine. His life is all above-board. He is piety, honesty, decency incarnate. To suspect him is to make one's self suspected. He is like the ermine; he would die of a stain. As we have said, he sails the little steamer from Guernsey to Saint Malo. One of his idiosyncrasies is never to forget a face he has seen. At the latter place, accordingly, he recognizes after a number of years the *ci-devant* humbug, Rantaine. He procures a revolver, surprises him on the cliff, just after (unfortunately, as you might say) he has confirmed his identity by pushing a coast-guard over into the sea; he faces him, and coolly demands a restitution of the fifty thousand francs. Such is his address that the formidable Rantaine complies like a child, and hands over the little box containing the money. Finding a surplus of ten thousand francs, Clubin returns them, pockets the balance, and dismisses the criminal. All that Clubin desires is to restore to his impoverished employer his dues. Forthwith, accordingly, he gets up steam, and departs for Guernsey, with his fifty thousand francs secured in a belt about his waist. On the Guernsey coast, however, the steamer enters a heavy fog, which soon obscures all progress; and, to make matters worse at this critical moment, the pilot is drunk. The captain takes the helm and advances boldly through the fog. But a sudden break in the sky shows the vessel to be close upon a terrible shoal, and before it can be avoided a terrific shock indicates that the steamer has struck. The passengers are huddled into a boat, but the captain, who has conducted himself throughout with admirable presence of mind, announces his intention of remaining with the vessel until it goes down. This ideal of heroism is vainly combated; the boat moves away, and the disinterested Clubin is left alone with the ocean, the wreck, and—do you see the point?—the fifty thousand francs. Doubtless, you do not see it yet; for, in the first place, the Sieur Clubin cannot use the money if he will, and then, as we know, he would not if he could. But here comes a grand *coup de théâtre*, one of M. Hugo's own. What if the virtuous Clubin should, after all, be no better than the iniquitous Rantaine, no better than a life-long hypocrite, the would-be murderer of a ship-load of innocents?

The author develops this hypothesis in a wonderful chapter entitled "The interior of a soul illumined." A very dark soul indeed is this of Clubin, needing all the rockets and bonfires of M. Hugo's speech to penetrate its dusky recesses. Left alone on the dreadful ocean, this monstrous being bursts into a wicked laugh. He folds his arms and tastes his solitude. He is free, he is rich, he has succeeded. Now he is going to begin. He has "eliminated the world." "There are caverns in the hypocrite," adds the author; "or rather, the whole hypocrite is a single cavern. When Clubin found himself alone his cavern opened. He ventilated his soul." "He had been," we furthermore read, "the Tantalus of cynicism." He now looks upon his honesty as a serpent looks upon his old skin; and as he does so he laughs a second time. But in these delights he does not forget the practical. His plan is to swim ashore (he is a marvellous swimmer), to remain hidden on the coast until a smuggling vessel picks him up, and then to make his way to America. His exultation, however, is but short-lived. As he looks the fog is rent in twain, and he sees that he has lost his way more effectually than he had intended. The fog has served him but too well. He has not struck the small shoal which he had, as he fancied, steered for, but a much larger one further distant from the shore. Instead of having a mile to swim, he has fifteen. Nevertheless he strips and plunges. As he touches bottom he feels his foot seized. Meanwhile the small boat has been picked up by a sloop, and the passengers have brought the evil tidings into the port of Saint Sampson. The good proprietor of the steamer is overwhelmed with grief for the loss of his precious, his unique, his laboriously wrought machinery. It is suggested, however, that it may still be recovered, that it may be disengaged from the double embrace of the wreck and the rocks, and successfully brought ashore. Whereupon Miss Déruchette steps forth and declares that she will marry the man who shall accomplish this herculean labor. Now this young lady has long been adored in silence by a young *amateur* of the ocean, a strange, brooding, melancholy, ill-reputed fellow, a kind of amphibious Werther, whose only outlet for his passion has been, for a number of years, to serenade his mistress with an instrument which M. Hugo repeatedly denominates a "bug-pipe." He accepts the challenge, and straightway betakes himself, alone and unaided, to the fatal shoal between which the hapless vessel stands wedged. Here begins M. Hugo's version of the struggle of man with the elements, "the *ananké* of things" promised in his preface, and a wonderful version it is.

The whole of the second book is devoted to the labors of this new Hercules in wrenching with his single hands the machinery of the steamer from the angry clutch of nature. Gilliatt (such is the hero's name) encamps upon the summit of a great rock hard by the field of his operations, one of a brace of strong brothers which just hold their chins out of water. Here, under the stars, surrounded by the world of waves, he spends the nights of two long months, during which, through hurricane and cold and fever and hunger, thirst, and despair, he gradually, by a combination of cranks and cross-beams and pulleys which, we doubt not, are as admirably self-consistent as the famous camel which the German philosopher evolved from the depths of his moral consciousness, he finally, we say, disenthralls the machinery from the shattered authority of the wreck. To believe so big a story you must understand what an extraordinary personage was this Gilliatt. M. Hugo has smoothed the way by a full analysis of his nature and habits at the opening of the work; but we protest in all gravity that we utterly fail to comprehend him. Physically, he is of those days when there were giants; morally, he is the product of too much reading of M. de Lamartine, Alfred de Musset, and M. Victor Hugo himself. "*La somme*," says the author, "he was simply a poor man who knew how to read and write." Elsewhere, he is "a great troubled mind and a great wild heart." He has thus a certain affiliation with Mr. Carlyle. Again, while he is defying the tempests and tides for the love of Déruchette, he is "a kind of Job of the ocean. But a Job militant, a Job conqueror, a Job Prometheus." There is a vast deal in this long description of his daily battle with the elements which we should like to quote, had we the space. A great deal we should quote for the reader's amusement; but for a few passages we should expect his admiration. Never, we believe, has mere writing gone so far: that is, never was nature so effectually ousted from its place, in its own nominal interest. We have room only for half-a-dozen sentences relative to Gilliatt's adventure with a certain hideous marine animal, called by M. Hugo the *pieuvre:* an enlarged jelly-fish, with tentacles, and eyes of hideous expression. This obscene creature will become famous through M. Hugo's magnificent hyperbole. "Compared with the *pieuvre*," he says, "the old hydras provoke a smile. Homer and Hesiod could only make the Chimæra. God has made the *pieuvre*. When God wishes, he excels in the execrable."

The author then proceeds with solemn iteration to rehearse all the monsters, fabulous and veritable, which have ever been the terror of man, together with their respective death-dealing attributes. The *pieuvre* has none of all these—none of these vulgar agencies of dread. "What, then, is the *pieuvre?* It is a sucker." It is, in appearance, a mere rag floating under water. When at rest it is dust-colored. But enraged it grows violet. Then it throws itself upon you. Fearful sensation! it is soft." Its tentacular thongs garrote you; its contact paralyzes. "It looks scorbutic, gangrenescent. It is disease arranged into a monstrosity." But we will leave M. Hugo the fine illustrations of his own tongue. "*Une viscosité qui a une volonté, quoi de plus effrayable? De la glu pétrie de haine.*" This irresistible creature devours you in such a way as to elicit from M. Hugo the following remark: "Beyond the terrible, being eaten alive, is the ineffable, being drunk alive." This is followed by some characteristic ratiocinations on physiology. Gilliatt comes near being absorbed into the *pieuvre;* but, for the matter of that, we all go into each other. "*Pourriture, c'est nourriture.* Fearful cleaning of the globe! Carnivorous man is an entomber; and life is made of death. . . . We are sepulchres." In spite of this general law, however, Gilliatt defers his burial by decapitating the *pieuvre*. Shortly afterwards he discovers, in a very nearly submarine cavern, a human skeleton, girded about with a money belt, inside of which is written *Sieur Clubin*. It was not in vain, therefore, that this unfaithful servant had been detained beneath the waters. Gilliatt appropriates, provisionally, the belt, and ultimately arrives at a successful solution of his problem in mechanics. His interruptions, his perils, his sufferings, his visions, must be read in detail. There is a long description of a storm which grazes the sublime and jostles the ridiculous. Detached from its context, any example of the former would, we fear, fail to justify itself to the reader; and, indeed, the nearest approach to greatness in this whole episode is not

to be found in particular passages, but in the very magnificent intention of the whole. As for the ridiculous, we cannot but think that it is amply represented by everything that follows Gilliatt's successful return with the rescued and renovated vessel. While Déruchette's uncle is digesting his surprise, gratitude, and joy, Déruchette herself is engaged in a very sentimental *tête-à tête* in the garden with a young Anglican divine. An involuntary witness of their emotions, Gilliatt immediately withdraws his claims. More than this, he personally superintends the marriage of the young couple, and sees them on board the vessel which, after the wedding, is to convey them to England. And after this, says the superficial reader, he of course goes home and smokes a pipe. But little has such a reader fathomed the depths of this heroic nature. He betakes himself to a well-known spot on the side of a cliff, where a depression in the rock forms, at low tide, a sort of natural chair. Here he seats himself in time to witness the passage of the vessel bearing away Déruchette and her husband. It almost "grazed the cliff," says M. Hugo. There on the deck, in a bar of sunshine, sit the happy young couple, lost in mutual endearments. The vessel moves away toward the horizon, while the tide rises to Gilliatt's feet. As the vessel travels before his unwinking eye, so gradually the water surges about him. It reaches his knees, his waist, his shoulders, his chin: but he moves not. The little birds call to him warningly, but he heeds them not. He sits open-eyed, gazing at the sloop. His eye, says the author, "resembled nothing that can be seen on this earth. That calm and tragic pupil contained the inexpressible." As the distant sloop disappears from the horizon, the eye is hidden, the head is covered, the ocean reigns alone.

Such is M. Victor Hugo's story. The reader will see that, dramatically, it is emphatically *not* what, from the title, it was likely pre-eminently to be—a study from nature. Nature is nowhere: M. Victor Hugo is everywhere; and his work will add very little to our knowledge of anything but himself. It is, in our opinion, the work of a decline. We have not hesitated to speak of it with levity, because we believe it to have been written exclusively from the head. This fact we deeply regret, for we have an enormous respect for M. Victor Hugo's heart.

MR. MAURICE ON THE DEMOS.*

Mr. Maurice, who is well known in this country as a leading member of the Broad Church party in England, has, perhaps, still higher claims to our regard as a social reformer than as a clergyman. Few men have labored more zealously than he for the elevation of the English working-men and the demolition of the middle wall of partition which has so completely separated them from the classes above them. He is principal of the Working-men's College in London, the establishment of which was, we believe, mainly due to his exertions. "The students," says the prospectus, "are for the most part working-men, and the teachers are in general members of the universities and of different professions, or those who have themselves been students in the college. Its purpose was and is to unite these classes together, by associating them in the common work of teaching and learning. It provides instruction at the smallest possible cost (the teaching being almost wholly unpaid) in the subjects with which it most concerns English citizens to be acquainted, and thus tries to place a liberal education within the reach of the working-man." The number of students the first year was 145; it is now 509. It began in a small, hired house, but now owns its own house; but is still greatly cramped, and is about to build rooms for drawing (this department is managed by Mr. Ruskin), for an adult school, for a lecture-room and museum. To assist in raising money for these objects, Mr. Maurice delivered a course of lectures on the suffrage, which are republished in the volume before us. The work is "dedicated" to "J. R., formerly a pupil in the Working-men's College, and now a tradesman in New York," and the language in which the author addresses him is worth quoting as an indication of the spirit in which the book is written:

"You wrote me an affecting letter last April when you had just received the news of President Lincoln's assassination. I have often thought of that letter whilst I have been composing this book. It suggested the connection between the questions which are agitating your old and your adopted country. It showed how much you were imbued with the spirit of an English citizen, and therefore how solemnly and with what brotherly interest you entered into the struggles and sorrows of the American people. You spoke warmly and affectionately of the studies you had pursued and of the friendships you had formed whilst you were with us. Perhaps these chapters from our own history will recall them to your mind, and will unite the wonderful events of this day in both continents to the education which God has given to our common fathers."

The lectures are ostensibly a historical examination of the relations borne by the House of Commons to the English people under the Plantagenets, Tudors, Stuarts, and during the eighteenth century. Mr. Maurice endeavors to show, and we will not say he has not succeeded in showing, that the Commons of England, whom the lower house of Parliament represented, were not the "people," in the sense in which the word is generally used in political discussions in our day, a collection of units, or rather, as Shakespeare makes *Coriolanus* call the plebs, "fragments," with no connecting link but their humanity. The Commons he declares to have been the "freeholders" of the counties, "freemen" of the boroughs, or, in other words, members of classes having certain well-defined relations to each other, and, together with the aristocracy, forming the nation, and deeply impressed with the subordination in which individuals should always stand to national life. This is a case which is not very difficult to make out, even with so few references to authorities as Mr. Maurice has thought necessary; but we cannot call the book, as a piece of political argument, by any means a success. The habit, which clergymen are apt to acquire in the pulpit, of treating subjects *à priori*, and which so often converts their secular lectures into didactic twaddle, has prevented our author from presenting any views that can fairly be called clear enough even for the purposes of popular instruction, and we accordingly rise up from the perusal of the book with the feeling that we have been making a long journey through very fine scenery in a very thick fog.

Mr. Maurice, like most English Liberals, even of the advanced school to which he belongs, is deeply sensible of the injustice as well as the absurdity of the electoral system which leaves five-sixths of the population unrepresented, except under that amusing Tory fiction which makes the few hundred thousand electors the "trustees" of the non-electors. But, like them, also, he recoils from universal suffrage with undisguised horror, as involving "a government of mere numbers," and as likely to produce great oppression of the minority at the hands of the majority. He is, therefore, anxious to discover some means or other of asserting the working-man's right to representation without recognizing his individual right to share in the government, or, to speak more correctly, in the appointment of the government. This he thinks he has lighted upon, in the theory which the book before us is written to elucidate—that individuals as such have no place and never have had any place in English polity; that voters have always been, and ought always to be, members of an organization, or persons clothed with a legal character, and he rather suggests than asserts that any departure from this custom would destroy the national continuity. The only way in which he even hints that he believes it would be well to admit the mass of the population to the enjoyment of the franchise is through the medium of co-operative societies or volunteer rifle corps. To vote as members or representatives of such organizations would, he thinks, keep the voter constantly in mind of his social obligations—his dependence upon and responsibility to others. The value of the franchise as a means of education Mr. Maurice does not even allude to.

When he comes to talk of the rule of the majority, Mr. Maurice seems to lose his self-possession, and talks very wildly. He denounces people who "boast of conforming to the will of a majority." "So help me God," he exclaims, "I do not mean to follow the will of the majority. I hope never to follow it; always to set it at naught." If this be not rant, it is something very like it, and it is due to the misconception so common amongst European liberals of the precise nature of the functions which American democrats at least assign to the majority. Mr. Maurice evidently imagines that the respect we claim for the will of the majority is based on the idea that the majority is always right—the modern rendering of the phrase, "Vox populi, vox Dei." But he is greatly mistaken. What we maintain is, that there must be somebody in every state authorized to decide every question in the last resort, and that as a mere matter of convenience the majority is the proper depositary of this authority, because in a free country it only possesses the means of enforcing its decisions. It may often decide wrongly, but not oftener than the minority; and we rely on the influence of free discussion and the general interest in the public welfare to prevent its continuing wrong, or, in other words, to reduce it to a minority if it be wrong. If Mr. Maurice means that he would always dissent from a majority because it is a majority, he also means that he would always vote with a minority because it was a minority. But to vote with either for any other reason than that he approves of the objects it has in view, and of its means of seeking them, would be an immoral act. There is no occult virtue in minorities any more than in majorities. By their fruits ye shall know them. Worship of the one without reference to its principles is just as base as worship of the other. What Mr. Maurice and all minority-worshippers lack is faith in the power of free speech and

* "The Workman and the Franchise. Chapters from English History on the Representation and Education of the People. By Frederic Denison Maurice, M.A." Alexander Strahan, London and New York. 1866.

in the influence of political equality and education on national character. Of course, all great ideas and all reforms are at first started by the few. By writing and speaking they eventually, if their discovery have any value, bring over the many to their way of thinking; but would Mr. Maurice here desert them? The minute he saw the goal in sight, and thought about to be converted into action, would he take to his heels?

We need hardly say that, for much of the monomania about "majorities" and the "demos" with which English Liberals are afflicted, classical education is responsible. When anything very puzzling presents itself in American politics, for instance, Mr. Maurice and his school, as well as the old Tories, run to their Thucydides or Aristotle for an explanation. In nine cases out of ten, as might be expected, the result they reach is wrong, because almost every element in the calculation is different from those furnished by ancient society. Until English university men can form a more correct estimate of the value of Greek and Roman history for political guidance in our day, their political speculations will continue to wear that unreal air which hangs so densely round the Pope's allocutions, and will continue to lead them into those prodigious mistakes as to the motive and tendencies of modern democratic society which made so much even of the comments of our friends upon American affairs during the war little better than expressions of kindly feeling.

SANS MERCI.*

EVERY now and then we find a man, and a clever man, too, who is a few centuries behind his age. The creature is rare with us Americans, because we live and move so fast that the most determined retrograde, let him do his best, can hardly get more than thirty or forty years in arrear. Over the water the type is more common, and Mr. G. N. Lawrence is a striking specimen of it. He ought to have been born in the time of the Stuarts and Louis XIV. His ideal is the feudal aristocrat, preternaturally strong and active, brave to rashness, greatly addicted to field sports, not over intelligent, and certainly *under* moral, entirely wrapt up in his caste, and regarding all outside it with indifference or contempt. Since the romances of chivalry there never were such bullies as the "Guy Livingstone" braves. They are always kicking and threshing men of the lower classes, snubbing men of the middle classes, yea, slaying and threatening one another. They can hardly address their lady friends in decorous language. The women of this society are as handsome, as physically courageous, and as unprincipled as the men. How such persons would actually fare in this nineteenth century Mr. Lawrence ought to know, since he tried to act out his ideal by campaigning in Dixie, and only succeeded in making himself the laughing-stock of his own countrymen, and so utterly contemptible here that no one noticed him or his book. At the same time we must not be understood to condemn "Guy Livingstone's" heroes and heroines utterly. They are not so bad as they might be, not nearly so bad as some people's heroes and heroines are. His women, though not exactly up to the standard of Christian maids and matrons, are infinitely preferable to the extraordinary females with whom Winwood Reade seems to have associated in English small towns; and we would rather take Guy himself for our model a thousand times over than one of "Fanny" Feydean's protagonists.

After all, Mr. Lawrence's great defect is more literary than moral. His fatal infirmity is being utterly inartistic. Though powerful in single scenes, he cannot construct a story. And the two ways in which his want of art chiefly develops itself are undue prominence of episodes and encroachment of the subordinate personages upon the principal. Thus, towards the end of his first novel, the fortunes of Forrester and Bruce quite overcome those of Livingstone in interest; while the best chapter in the book (the night attack on Mohun's house) is purely episodical, and leads to nothing. So, too, in the present work, all the Maskelegne and Standen business is foreign to the main story, with which it has hardly the faintest pretence of connection, and all its effect is to divert the reader's attention from Flemyng. The "or" is a completely disjunctive conjunction between "La Belle Dame sans Merci" and the "Kestrels."

And these, though the principal, are not the only ways in which Mr. Lawrence's inability to *motiver* (as the French call it) a story develops itself. "Sans Merci" professes to illustrate the propositions that gambling will ruin a man, and that a beautiful coquette may drive him to destruction. To set forth these not very novel truths in the most telling manner, the victim should have some ability or amiability or virtue, or all three; and, to connect the two morals, he might be driven to play by the demoralization consequent on his love disappointment. Instead of which Flemyng is neither clever, popular, nor good; nay, he is guilty of the one unpardonable sin in Mr. Lawrence's eyes—hesitating to ride a strange horse at a fence—and he was a confirmed gambler before he saw Florence Dorillon.

There are also some things in the present volume which look ominously as if Mr. Lawrence was writing himself out. The early chapters contain a great deal of "padding," and two or three of them are occupied by a fox-hunt. We really wish the hounds could have a little rest—on paper. They are getting to be a greater nuisance even than the eternal ball and duel *ficelle* in French plays. The English reading public ought to make up a handsome subscription for a portion of the English writing public on condition that during the next two years there should be no "stunning runs" transferred to print except in the columns of *Bell's Life*.

* "Sans Merci; or, Kestrels and Falcons. By the author of 'Guy Livingstone.'"

ARCHITECTURAL REFORM.*

SECOND NOTICE.

UNLIKE England, France is essentially artistic. The imagination of her people has ever been bold, enterprising, and indomitable, even under the organized restraints of a National Academy. The last of the chivalry of France became *dilettante* in the Italian wars of Louis XII. and Francis I. With other *spolia opima* of their conquests they brought back the art and artists of Italy. They planted the Renaissance on French soil. But with all their imported artists, with all their Primaticcios, their Berninis, their Da Vincis, they never built an Italian palace in France. The artistic instinct was too strong to yield to foreign dictation in matters of art. The new forms and ideas were received from Italy, but there was at once mingled with them a national sentiment. The chateaux of Blois, Chambord, Amboise, Chenonceau, Madrid, Fontainebleau, arose not in imitation of the palaces of the Farnesi or the Medici, but as new expressions of French art in harmony with the new taste which had arisen for classic learning. The formulæ of classic architecture, the exact proportions of the orders, as laid down by the Italian masters of the fifteenth century after Vitruvius, which were received submissively, and used with scrupulous bigotry, by all such unimaginative nations as the English, never had much authority in France until Louis XIV. established the School of Fine Arts, for the purpose of doing for art what the French Academy was intended to do for literature, viz., to organize, chasten, and keep it respectable. The Academy kept the language pure by concerning itself with verbal niceties of expression, by chasing panting syllables back to Noah, by eliminating from the dictionary all words without a pedigree, lopping off all those concretions of time which made language picturesque but rude. It did a good work; but its business was less with the matter than the manner of composition.

Such was the case, also, with the professors of the School of Fine Arts. Their tendency was to create standards of authority in art, to become a learned and exclusive areopagus, to foster and establish such formulæ of expression in design as they could find concrete in the ruins of Rome, to pride themselves upon the exactness of their knowledge, and to keep architecture pure from contact with the vulgar. Indeed, their aim was to talk unsullied Latin in the midst of modern France. So far as this went they did far better than the English. They built the Hôtel des Invalides and the Madeleine and the Louvre, while the English uttered their best architecture in St. Paul's and Somerset House. This advantage the French obtained less from the fact that their architectural learning had become organized under royal patronage than from their natural freedom and grace of imagination, which, though under the most oppressive of all restraints, could not but assert itself. The results of the French Renaissance are beautiful. All recognize this; but many have lately arisen in France who question whether this beauty, which they find recommends itself only to the cultivated, and is understood only by the initiated, should not be an inspiring presence in the midst of the nation; whether this lovely Franco-Latin, if made pure French, so as to be understood by all, might not touch more hearts, and thereby accomplish the higher purposes of art. This question has been urged by certain men who have been rejected by the Academy because they believed that the indigenous mediæval art of France should be revived, and that into this channel exclusively all architectural thought and effort should be turned. The warfare of words between these two parties has been all the more bitter because the School of Fine Arts has become grey in a traditionary creed, and can point to a long historical record full of triumphs, while the new mediæval school is regarded as schismatic in the highest degree. But heresy begets heresy. Other schools have lately arisen, such as the Greek school and the Romantique; they have most of them beat themselves to death against the solid fabric of the national school. But this school has not been

* "Entretiens sur l'Architecture, par M. Viollet-le-Duc, Architecte du Gouvernement et Inspecteur Général des Edifices Diocésains." Paris: A. Morel & Cie. 1863.

insensible to these various shocks. It has gradually enlarged the borders of its phylactery, and become more catholic; but in the year 1863 it received from the hands of one man a blow far more effective than any yet administered. It was a veritable *coup d'état*. On the 13th of November, in the year above named, an Imperial decree, inspired by M. Viollet-le-Duc, Government Architect and Inspector of Diocesan Buildings, was issued, making fundamental changes in the School of Fine Arts, turning out all the professors, and establishing a system by which the professors instead of being a self-electing body were to be appointed by an officer of the Imperial household, thus virtually breaking up that exclusiveness which was the peculiar characteristic of the academical faculty. The *coup* was autocratic and ill-judged. M. Viollet-le-Duc was made professor, but soon found it expedient to resign, the active and incessant opposition of the old school rendering his position uncomfortable and practically useless; and finally, for various reasons, the school relapsed silently into nearly the former condition of things. The seed of judicious reform has, however, been planted in good ground, and will bear fruit.

M. Viollet-le-Duc has long been known as a profound scholar in mediæval architecture and a man of indomitable activity and enterprise. He is an architect of extensive practice and influence and a profuse author of archæological works, chief among which is his "Dictionnaire Raisonné de l'Architecture Française du XIe au XVIe Siècle," now in process of publication. But in his "Entretiens sur l'Architecture" he has, in our opinion, asserted his claim to a far higher position than any other work of his can give him—that of the leading architectural reformer of France.

It is difficult for any work touching the higher occupations of human thought to be other than controversial in a city like Paris, which is an intellectual arena thronged with combatants and partizans, each ready to assert his creed against any opposition. These "Entretiens" have been thrown out, like a weapon, in the midst of a ceaseless warfare of books, pamphlets, and articles concerning art. They were intended to strike mortal blows against old abuses and against prejudices which have become venerable. The tone of the work is, therefore, necessarily polemic and, to a certain extent, local. Without the singular literary ability of the "Stones of Venice" or the "Seven Lamps," it is a deliberate declaration of opinion, uttered by a practical architect, thoroughly versed in all the technical points of his profession and conscious that he is speaking in the midst of an audience severely critical. Though he writes with the same aim and intentions as Ruskin, he is far more valuable to art, because less visionary, less poetic, and less dogmatic. He has a palpable, concentrated enemy before him, inspiring him to directness and animation of thought. He has no cause, like Nero, vaguely to wish that the Roman people had but one head, that he might strike it off; for all the elements of opposition are incarnate in the School of Fine Arts. Yet he is no radical; his work is in no sense that of an intemperate fanatic. It may be described in general terms as an appeal to reason against prejudice. In this is its strength, and in this is its immeasurable value to the cause of art throughout the world. We are glad to know that it has been translated into English by an architect of this country with a view to its publication here at an early day. We shall hail it as a promise of better things.

Though it has been generally understood in France that M. Viollet-le-Duc is a warm partizan of the revival of mediæval architecture, this work exhibits him as a philosophical investigator of the whole field of architectural precedent, building up his conclusions from a broader basis of study than any of his predecessors. He earnestly denies that his views are confined within the narrow limits of a specialty. On the contrary, he undertakes to develop the great principles of architecture by a thorough, searching, and appreciative investigation of all the great eras of art, by a comparative analysis of Greek, Roman, Byzantine, Mediæval, and Renaissance architectures. He contends that merely to describe and illustrate in turn these various styles, without indicating the process of their growth and their relations with the genius of nations, without seeking in the history, institutions, and manners of every country the primary causes of its peculiarities of form in art, is to make a sterile compilation of numerous antiquarian works which are available to any one who searches the public libraries. "Should I confine myself," says he, on the other hand, "to treating of one style to the prejudice of all others, I should regard myself as doing that which is dangerous to the true interests of education in architecture, and I shall never cease to condemn all who profess to teach with any such narrow aim."

M. Viollet-le-Duc professes to enter upon a task so new and so difficult with great diffidence, but he proceeds to say in his preface:

"One thing alone sustains and encourages me—my respect for truth, my love for an art which, in all its forms and styles, has never in my life ceased to be an object of careful and, I think, unprejudiced study. I should be content if my efforts had no other result than the inculcation of this principle: to judge the architecture of the past not by prejudice but by reason, to neglect no lesson which it can give, and to combine the results with method and discrimination. I feel that the new generations of architects are eager for knowledge, that they have no taste for the sterile disputes of rival schools, and that they are filled with the practical spirit of our age, which demands liberal and unprejudiced education. My aim in writing on architecture is to investigate the reason, the cause, for every form of the art, for no historical form or style is merely capricious; I propose to indicate the origin of the different principles of the art and their logical consequences; to analyze such styles as are the most logical results of these principles, and to explain their process of development; I propose more especially to explain how all these ancient arts can and should be applied to modern use; for the everlasting principles of truth underlie them all. Man, though his manners and customs may undergo modifications in the course of history, remains in spirit the same, with the same reason, instincts, desires, passions; he has employed various languages, various forms, but these have been inspired by the same humanity, have served to express the same ideas, and satisfy the same necessities of life. No expression of this many-sided life should be despised. I declare distinctly if any of my readers are disposed to believe that I profess doctrines profitable or agreeable to one school rather than another, he will find himself in error, as these discourses will prove. I have taken up my pen with no intention of propagating systems or refuting theories to gratify passion or party. I have another aim: to know the truth, to develop the immutable principles of our art, applied, as they have been, variously by various civilizations. I shall express no preference for one style or form of architecture rather than another; neither shall I say, You have heard—now choose; but I shall endeavor to give to the architectural studies of my readers definite direction and method. In no other way can such studies be made profitable in practice or criticism. The professor who indicates to his pupils all the paths of knowledge alike, without pointing out the best and showing why it is the best, is a bad professor; he creates in the minds of his pupils obscurity and confusion instead of order and distinctness. But this path should be no narrow, beaten track of habit or prejudice; it should be wide, large, and free to all, so that each one can follow it according to his inspirations, his natural leanings, his peculiar genius. This path is the only true and profitable one, the only one which does not lead astray, the only one by which human reason has reached its highest and best results. This is the path which, though in many very different ways, has been followed by all the artists of the most glorious epochs of antiquity and modern times."

No architectural writer has professed a creed more liberal and rational than this, or developed from it a theory of architecture more in harmony with the progress of civilization. We are sorely in need of such a philosophical analysis of the art and a judicious elimination of all those accidental and merely capricious features of it which are conventionally accepted as models of design. M. Viollet-le-Duc has entered upon his task with the highest inspirations. He betrays, of course, certain very human traits of prejudice; but, it must be admitted, nowhere else on the whole has the subject been treated so philosophically and so fairly, or with a basis of knowledge so thorough and so comprehensive. Thus, his critical analysis of the architecture of Greece and of Rome exhibits the forms of Greek and Roman art not merely as certain æsthetic results, to be studied for their own sake, but as expressions of the two civilizations respectively, as deliberate but unconscious records of history. It enables us to contemplate that history not as a mere story of the movements of parties and rulers, not as we behold it from the familiar stand-points of literature, but as an exhibition of the *genius of the nations*, to which the facts of traditionary or written history are in every sense subordinate. M. Viollet-le-Duc's "Entretiens," in this respect, are a signal and singular contribution to the sum of human knowledge. In these and in all the other eras of architectural history on which he touches, he concerns himself with the process of the development of styles and with the sources, the main springs, of this process in the character of peoples. This is the philosophy of the history of architecture, which is valuable not only for what it adds to our knowledge of general history, but, more especially, for the information it affords regarding our own relations with the architecture which we are creating around us.

We earnestly recommend this remarkable work to all who would seek for a satisfactory reply to the popular and frequent demand for *a new style*, an architecture of the nineteenth century.

Stonewall Jackson. A Military Biography, with a Portrait and Maps. By John Esten Cooke, formerly of Gen. Stuart's staff. (D. Appleton & Co., New York.)—We profess to be unprejudiced by the purely rebel stand-point from which this work was composed, when we attach very little value to it in any particular which would make a real military biography welcome from either side of the late controversy. As regards the hero himself, the author seems qualified to tell us little except a few anecdotes at second-hand, which he subjects to constant repetition. In this way we learn pretty accurately how Jackson looked and dressed; but the analysis given of his character and of his genius for battle is not more intimate than may be fairly deduced from his well-known exploits; and it may be added that this record of his campaigns carries no more authority than would that of an aid-de-camp of

Gen. Stoneman who should compile existing accounts of the same occurrences. Mr. Cooke often admits that he cannot state positively the number of Confederates in a certain engagement, but this is the information which, as not being ours, we most covet; and we must remain incredulous, not because to accept his figures would be humiliating to our pride, but because he does not inspire us with faith in his surmises. For an eye-witness of many battles, he is singularly prone to give reins to his imagination in describing a field of carnage, and we are expected to believe that at Manassas there was a bayonet charge and encounter—a story that may be told to the Zouaves! As a military critic he disarms consideration in advance by asserting that McClellan will probably rank as the ablest Federal commander of the war! On p. 60 he ascribes the confidence with which the Union troops met the enemy at Bull Run on the memorable 21st of July, 1861, to the fact that the President had called for 400,000 men and a loan of $400,000,000, and "Congress had voted these great supplies with acclamation." On p. 79 he rightly refers to this action as a *consequence* of the Bull Run disaster. The supplies were voted on the 22d of July, and the issue of the war became thereby distinctly foreshadowed.

It could not be said of Jackson, as the author says, *mutatis mutandis*, of McClellan, that his sentiments toward the North "were those of a soldier for an open and *powerful* opponent." He never overrated his adversary. He erred rather on the other side, and on the theory of *toujours l'audace!* cherished all through his career an eager desire to invade the North. Mr. Cooke would have done us a service if he could have told us how much this desire, joined to his prestige with the authorities at Richmond, was the cause of the policy which General Lee is commonly thought to have deprecated, and which received a crushing condemnation at Gettysburg. Jackson's piety is not shown to have been the secret of the devotion of his troops to him. That it was sincere we will not question; that it was prominent is possible; that it was enlightened, we can by no means allow. All the scraps of his reports and conversations, from which it is striven to make out a highly religious nature for him, neither elevate him nor his cause in our eyes. From having, as a West Pointer, bound himself to defend the country which educated him, he descended to take the Confederate oath of allegiance—an act which General Lee remembers to forget in his own case. What are piety and abstinence against such an infidelity? The weakness of the argument was well betrayed in a prayer we once heard from a colored chaplain of a colored regiment. He was, in a sermonizing way, enforcing the power of prayer upon his dusky auditors, and, having instanced Washington, was unfortunate enough to cite the success of Stonewall Jackson as an illustration. But perceiving that he was in danger of impeaching the discrimination of the Almighty, he suddenly pointed his moral thus: "What I want you to understand is, that it makes no difference *where* your praying is done—*whether by a wooden fence or a stone wall!*"

Mr. Cooke's book is handsomely printed, has two or three useful maps, and an excellent portrait.

The Song-Book. Words and Tunes from the Best Poets and Musicians. Selected and arranged by John Hullah, Professor of Vocal Music in King's College, London. (J. B. Lippincott & Co., Philadelphia; MacMillan & Co., London.)—We welcome this little book with both hands. Lovers of pure old melodies have long been desiring just such a collection from the treasuries of English, Scotch, Irish, and Welsh songs. For the Irish and Scotch music we have not been so badly off; but good English airs of the "olden time" are, strange to say, not easy to get. Especially do we delight in the Welsh series of "The Song-Book," not only because they are quite novel, but on account of their intrinsic beauty. Their individuality is strongly marked. Not at all like the Scotch melodies, and yet reminding one equally with them of harpers, mountains, and heather; of battles, of rugged loyalty, of romance. We challenge any one to listen to "I Hear the Trumpet Sounding," and not be stirred by its wild minor ring; or to the serenade, "All Through the Night," and not be touched.

As for the American assortment we can only laugh over it. Can it be that this woful presentment of our specimen "national songs" is a gauge by which we may measure England's knowledge of us in other respects? After the compliment in his preface, too! in which Mr. Hullah says that he has broken his rule excluding contemporary songs in our case, because somehow our national melodies acquire early the flavor which age alone imparts in the Old World, where many of them have taken as strong hold as they have here. After that, we say, to behold under "Part V., American Songs," these: "I 'm off to Charles*town*," "Wait for the Wagon," "Cheer Up, Sam," and "Old Dog Tray!" We confess to the "Wagon" and to the "Old Dog"—we have heard both, several times; but for the other two we will not declare that they never were made here, only that we have not been among the happy number to hear them. However, let us hope that this exhibition of ignorance will inspire some one of our countrymen to emulate the example of Mr. Hullah in respect to Great Britain, by forming as good a collection of American popular airs as he has done of British. We have the amplest material and the broadest variety; from the capital little songs that have their day in the street, to the beautiful and entirely unique negro melodies that are now reaching us from every part of the South.

We cannot help regretting, spite of Mr. Hullah's exp'anation, that these songs are given to the public without accompaniments. We would have resigned two-thirds of them in order to have the remainder rendered ready for our pianos as well as our voices. For, notwithstanding the very just reasoning, that the original character of the music is often lost through the addition of an unsympathetic accompaniment, yet it is also certain that people will not sing now-a-days without the piano, and if Mr. Hullah, who has studied these airs, cannot trust himself to accompany them, who will have the temerity to do so? Besides, many persons who sing ballads with taste, have not the power to compose any kind of harmonizing and proper chords, and therefore—we speak from experience, not hypothesis—reject such books as Mr. Hullah's, as being entirely useless to them. Still, apart from this, and in view of its many excellences, we recommend this last issue from the "Golden Treasury" to all ballad-lovers, reminding them that Mr. Hullah, its editor, is the composer of several pleasant songs we all know, one of the best of which is "The Three Fishers," to the words of Charles Kingsley.

Letters of Life. By Mrs. L. H. Sigourney. (D. Appleton & Co., New York).—We never lay down a volume of memoirs, no matter of how meagre a life, without being confirmed in our conviction that there are few kinds of reading more truly edifying in a number of ways than that of biographies and autobiographies. They are history in its pleasantest and most retainable form. They are novels with no possible blemish of inconsistency, because every event in them really did happen. They are the most perfect of all character-studies; you may learn more of human nature from one of them than from a dozen essays especially devoted to the subject. Often records of greatness in one form or another, it does one good to be drawn into sympathy with lofty purposes, noble struggles, and high achievements. Their silent examples we are all the more prone to follow because they are not thrust at us; precepts which we have perfect liberty to reject, there being no witnesses to our folly, are apt to hang about us and twitch at our consciences till we are willing to turn and recognize them.

Mrs. Sigourney's book is far from being a great one. The reader will pardon much to the septuagenarian, and receive with a reverential rather than a critical spirit the tale of so long, so spotless, and so industrious a life. Let what we shall say, therefore, be considered in the light of a preface, of which the book has none.

These memoirs have little value as contemporaneous history, or as a description of old-time life and manners. In her pompous, old-fashioned prose—the approved style of fifty years since—Mrs. Sigourney paints us a picture of the "spot where she was born," which is about as much like a real place as if she had worked it in floss on a sampler. So with the account of her childhood and girlhood, which she gives in Johnsonian periods. Take one sentence, relative to the simplicity of her diet: "The stomach, that keystone of this mysterious frame, not being unduly stimulated, no morbid tastes were formed, and no undue mixture of saccharine or oleaginous matter caused effervescence and disease." Nor must the book be sought for its analysis of character. A woman with household cares, who managed to write and publish fifty-seven separate works, together with countless stray magazine articles, who wrote two thousand letters per annum, kept a daily journal, and still found time for as many outside occupations as would fill the life of a common woman, had hardly the leisure to be watching her own or anybody else's "inner processes." She was not one to question or doubt; she took life as she found it, accepted each event as it came, and spoke what her eyes saw and her most simple heart felt. And it is in this special trait of straightforward faith that Mrs. Sigourney's "Letters of Life" have their charm. Women's writing has advanced leagues since her prime, yet young girls in the rush and whirl of our modern excitements would do well to ponder a career so serene and so useful. Those in advanced life who prize Mrs. Child's "Looking Toward Sunset," will prize this volume also, a picture of peaceful old age and a happy death.

The Origin of the Late War. Traced from the beginning of the Constitution to the revolt of the Southern States. By George Lunt. (D. Appleton & Co., New York.)—Mr. Lunt belongs by political affiliation to that minority of our fellow-citizens known as Copperheads, and to that branch of the conservative party which has been rightly labelled Fossils. His place in a cabinet of natural curiosities would be on the same shelf with Mr. Buchanan and Mr. George Ticknor Curtis. Dead to the age in which he lives, he persists in muttering the jargon of the time in which he flourished—speaks as if to an audience destitute of memory and blind to the revolution which swallowed him up. He tells you slavery was the cause of the war "just as property is the cause of robbery." It is the reverse of Proudhon's maxim: *le vol, c'est la propriété*. He talks of the war dragging heavily after McClellan was displaced; he would almost take his oath it never came to an end. He says of Mr. Lincoln: "His character appears to have been defiled by no vices; but much more than this was requisite in his position." Something more, also, is requisite in a would-be historian, who believes (p. 14) that his work "will not be found liable to the charge of inaccuracy," and accuses Mr. Garrison (p. 74) of being "by birth a native of the British American provinces," when everybody knows who cares to that he was born in Newburyport, Massachusetts. Mr. Lunt's inaccuracies are accompanied by repetitions of stale slanders, credulous or wilful misrepresentations, and that utter indifference to moral considerations which marked the era of Democratic statesmanship and Democratic rule. We have not for a long time read a book with so much impatience and, the term is hardly too strong, disgust. The only remarkable thing about it is that it is published in New York rather than in Boston; but no one who is aware of the esteem in which the latter city holds the memory of the *Courier*, will wonder that its late editor has sought a more congenial community.

The Parables, Read in the Light of the Present Day. By Thomas Guthrie, D.D. (Alexander Strahan, London and New York.)—Dr. Guthrie rightly considers the parable the most effective feature in the teaching of Jesus. It is, perhaps, a legitimate enquiry how far its peculiar qualities of brevity and directness have been neutralized in our modern pulpits by making it a text instead of a complete sermon, as it was to those who first heard it, were touched, and straightway believed. In general the parables of the New Testament are clear to the commonest understanding, yet possibly false methods of interpretation may arise, like those exposed by the reverend author. His rules on this point are the obvious ones. We think, however, that, in illustrating them, he opened a wider door to the Universalists than he meant to, when he says we are not to infer, "since the number of the wise and foolish virgins was equal, that the lost are as numerous as the saved.', This he holds to be a very dreadful, as it certainly is a very uncalled-for, con

clusion. "If, at the close of the war, Satan retains half his kingdom, his head is not crushed, nor, if he carries off half his forces from the battle-field, is he defeated, as I would hope he shall be." But, in an argument drawn from the power of the Creator, Omnipotence might fairly enough be expected to leave Satan without a single captive as a trophy; and the Universalist may pretend that for one soul to be irredeemably lost "under the reign of a benign and merciful God, notwithstanding the blood poured out on Calvary," is as incredible as that half the human race should be doomed to perdition.

Science.

SCIENTIFIC NOTES.

Color-blindness.—Dr. Rose, of Berlin, has made some recent additions to our knowledge of the subject of color-blindness or color-disease, a very common defect in the human eye which has not been sufficiently studied. Of persons whose appreciation of colors is not natural and healthy there are two classes—the color-blind and the color-mistaken. The retina of a person who is color-blind has actually lost sensibility for light of certain colors, so that where a healthy eye sees violet, for example, the diseased eye sees only blackness or darkness. On the other hand, a person who is color-mistaken is unable to distinguish between two opposite complementary colors of unequal intensity, or he supposes two unequal intensities of one tone of color to be opposite colors. Color-blindness may be temporarily induced in a healthy person by the administration of certain drugs, such as atropine and santonine (an extract of a species of wormwood), and Dr. Rose's results are based in part upon thirty-five such cases of artificial color-disease, his own included. When color-blindness begins it is always light of the greatest or of the least refrangibility that first becomes imperceptible, and as the disease increases the patient successively loses the most or least refrangible rays which had just before been visible to him. Hence color-blindness is always characterized by a shortening of the spectrum furnished by the sun on the gas flame, never by gaps or interruptions in it. A complete and well-defined spectrum thus forms the best test or measure of the degree of color-blindness. On one occasion in Dr. Rose's own case, the red end of the spectrum became entirely invisible when he had taken ten grains of santonine, but in other similar experiments the violet part of the spectrum lost its color, and presented only a dull whitish appearance. During the intoxication produced by santonine, the vision is generally yellow, all mixed colors presenting a greenish-yellow appearance. For the eye affected the spectrum is shortened either at one end or the other, either red or violet becomes invisible, and the eye is, therefore, not sensitive to the red or violet element in mixed colors. Liver diseases produce color-blindness of very various degrees. Dr. Rose observed it in persons suffering from jaundice, from enlargement of the liver, and from cancer of the liver, and he suggests that the gravity of an attack of jaundice may perhaps be foretold by the degree of color-disease which it causes. The spectra of certain metals, as produced in the spectrum apparatus of Bunsen and Kirchhoff, afford excellent means of determining the extent and precise character of partial color-blindness. The metal potassium, for example, gives a bright red line which invariably occupies one and the same place in the spectrum. If a person cannot see this line, it is certain that for him the natural spectrum is shortened at least as far as that line, and he is blind to all the red which lies without it. Lithium gives also a red line, but in a different place in the spectrum from the potassium line. Invisibility of the lithium line proves a still greater shortening of the spectrum. Another metal, strontium, produces several orange lines and five red ones in the spectrum, and consequently offers several well-defined limits at which color-blindness may be proved to begin. Color-blindness may occur with regard to both ends of the spectrum, and may go to such an extent as to reduce it to less than half its natural length. Color-blind persons not only suffer the great deprivation which results from seeing everything of one color, but their vision is in general weak and their eyes are peculiarly liable to be dazzled by sudden lights. A chronic spasm of the eyelid is a frequent accompaniment of color-blindness. What is meant by color mistake may be illustrated by the "violet vision" which occurs in the advanced santonine intoxication. To the eye in this condition dark objects appear violet, when to the normal eye they have no tinge of this color. A person in this condition may at the same time be violet-blind; that is, unable to see the violet portion of the spectrum. Yellow vision is often combined with violet vision at the same time in the same person, when the following experiment becomes possible: one who cannot see the violet end of the spectrum at all, will think a yellow flame, seen through a yellow glass, to be yellow; seen through three or four such glasses to be violet; that is, a person so affected thinks two unequal intensities of the same color to be opposite colors.

All persons with whom the difficulty about colors is congenital are color-mistaken, and it is probable, but not certain, that all such persons are to some extent color-blind. As a rule, color-mistaken persons see objects red, the violet vision, under the stimulus of santonine, being a marked exception. When we remember that color-mistaken persons may be at the same time color-blind—indeed, blind to red and to violet, and both to different degrees—it is easy to understand that no such person sees color exactly like another, and that very different perceptions of color must be produced in different persons by the same excitation. Among fifty-nine color-diseased persons Dr. Rose found no two who exhibited exactly the same sense of color.

Teachers of blowpipe analysis, assaying, and spectrum analysis, are familiar with the fact that color-disease prevails to an extent not generally credited. Students of these chemical processes often fail utterly, solely from the inability to appreciate the various tints and changes of color which are relied upon for the identification of substances, or for guidance in the execution of the delicate processes of analysis and separation.

Filtration by Capillary Attraction.—A Frenchman named Vigié proposes to apply the power which occasions the ascent of liquids in small tubes for the purpose of filtering water upon a grand scale. In accordance with the laws of capillary attraction, water, when in contact with any porous substance, is lifted by the latter to a certain height. Now if, after having attained this elevation, the water encounters the bend of a syphon, it will pass through this channel and flow down upon the other side in a regular and steady stream.

The water thus lifted by the capillary force is perfectly clear, and is as completely free from suspended matters as if it had been passed through an ordinary filter. The syphon arrangement employed by M. Vigié in his experiments was constructed of rods of very porous earthenware. It is claimed for the apparatus that it does not become clogged, and that it will continue to work without cessation even when it is immersed in mud. Another very simple and perfect form of filter, depending upon the same physical principles, is made by placing within a tank containing impure water a small vessel in such a position that a sponge, which it contains, shall lap over its edge and dip into the water of the tank. The sponge gradually sucks up water from the tank and then allows it to drop into the small vessel or receiver, where it will be found in a perfectly clear state. The clear water may be continuously drawn off from the receiver by a suitable tube. By placing a few pieces of charcoal in the bottom of the receiver the last traces of odorous or sapid impurity can be removed from the water.

Formic Acid from Oxalic Acid.—There are a multitude of chemical products possessing valuable properties which, though well known in the scientific laboratory, have never come into common use in the arts on account of the difficulty and expense of their production. It is a matter of general interest, therefore, when, as now in the case of formic acid, an improved method of manufacturing one of these agents is discovered. The new process of Mr. Lorin, by which formic acid is obtained in any quantity and in a highly concentrated condition, is based upon the fact that, on adding solid oxalic acid in successive portions to hot glycerine, the oxalic acid will split up into water, carbonic acid gas, and formic acid. On heating a mixture of common oxalic acid and commercial glycerine the reaction commences at the temperature of 167° F., and is vigorous at 194°, the products being carbonic acid and a watery distillate charged with formic acid. On adding now a new portion of oxalic acid, some time after the disengagement of carbonic

acid has ceased, the decomposition will immediately recommence, and a new portion of liquid more highly charged with formic acid than the preceding will distil over. With each successive addition of oxalic acid the proportion of formic acid in the distillate increases, until at length a limit is reached which is precisely that which theory would indicate as the proper result to be obtained with crystallized oxalic acid. The apparatus being now in working order, there can be obtained from 126 parts of oxalic acid 82 parts of an aqueous solution which contains 56 per cent. of real formic acid. This method of obtaining the acid of 56 per cent. is continuous, regular, and exceedingly simple. There is no need of paying any attention to the temperature, since both the beginning and the end of the operation are indicated by the evolution of the carbonic acid. In practice it was found that one and the same portion of glycerine could be used during several months in an apparatus which was worked night and day without intermission. A single portion of glycerine would serve for the production of an infinite amount of formic acid were it but possible to avoid the slight loss which is incidental to the mechanical part of the operation, and were it not for the presence of small quantities of impurity in the oxalic acid, which at length accumulate to such an extent that a fresh charge of glycerine has to be taken.

By employing anhydrous oxalic acid in place of the crystallized article above mentioned, formic acid as strong as 75 per cent. can be obtained, but the evolution of carbonic acid commences, in this case, at a temperature below 122°, and the operation must be very carefully conducted in order to avoid frothing. Finally, by dissolving anhydrous oxalic acid in warm formic acid of 70 per cent. and then cooling this solution, a quantity of the oxalic acid will crystallize out, taking with it almost all the water, and on now pouring off the clear liquor and distilling in order to remove from it the oxalic acid which it still holds dissolved, there will be obtained formic acid of very nearly 100 per cent., which is capable of crystallizing on being sufficiently cooled. In order to prepare the various formic ethers, Lorin adds to the warm glycerine a mixture in equivalent proportions of oxalic acid and of the alcohol which corresponds to the desired ether, the product being finally distilled off some time after the oxalic acid has been completely decomposed.

The first source of formic acid was red ants, whence the name of the liquid. Samuel Fischer first distilled ants, but Marggraf published, in 1761, the first minute description of the acid. The acid obtained from the ants was, of course, very small in amount and very dilute. Marggraf distilled the ants with water till half the liquid had passed over, and then distilled a stronger acid from the liquid obtained by pressing the residue. The progress of organic chemistry now enables us to prepare with great facility oxalic acid from sawdust, and formic acid from oxalic acid, thus producing artificially, in large quantities and in a concentrated condition, two acids which exist ready formed in nature, but only in minute quantities, very difficult to extract and isolate.

NEW BOOKS

TO BE PUBLISHED IN APRIL BY

CHARLES SCRIBNER & COMPANY,

124 Grand Street, New York.

I.

LIFE OF BENJ. SILLIMAN, M.D., LL.D., late Professor of Chemistry, Geology, and Mineralogy in Yale College, Founder and Editor of the "American Journal of Science and the Arts," etc., etc. By GEO. P. FISHER, Prof. in Yale College. 2 vols. crown 8vo, with fine portrait and other illustrations. Cloth, $5.

This work is, to a large extent, compiled from the copious reminiscences which Prof. Silliman wrote in the last years of his life. It embraces a detailed record of the rise and progress of the departments in Yale College which, during half a century, were under his care, and is, indeed, a full record of his public labors and personal history, including his intercourse with eminent men. Besides Prof. Silliman's own letters, the work contains many interesting letters, from his correspondents at home and abroad, including Chancellor Kent, John C. Calhoun, Robert Y. Hayne, J. Fenimore Cooper, President Hitchcock, Josiah Quincy, Humboldt, Carl Ritter, Agassiz, Lyell, Murchison, Herschel, Mansell, etc., etc. In the Appendix are printed very important letters from Gen. Washington, and also letters from John Adams, Lafayette, and others, addressed to the members of the Trumbull family.

II.

SECOND VOLUME OF LANGE'S COMMENTARY; containing MARK, edited by Rev. Dr. W. G. T. SHEDD; and LUKE, edited by Rev. Dr. C. C. STARBUCK. 1 vol. royal octavo. $5.

We are now printing the sixth thousand of the first volume of this work, containing MATTHEW, edited by Rev. Dr. P. SCHAFF.

These volumes contain one-fourth more matter than the original. Other volumes of the Commentary are already in course of preparation by the editor and the Rev. Drs. Schaffer, Poor, Lillie, Hackett, Yeomans, Kendrick, Mombert, Starbuck, Day, and Tayler Lewis. Each volume will contain one or more books, and thus be complete in itself. Price of each volume, $5.

III.

TWO NEW VOLUMES, 5 AND 6, OF FROUDE'S ENGLAND.

HISTORY OF ENGLAND, from the fall of Wolsey to the death of Elizabeth. By JAMES A. FROUDE, M.A., of Exeter College, Oxford. From the fourth London edition. In crown 8vo. vols. Price $2 50 each. (The other volumes will follow shortly.)

Mr. Froude has shown in his admirable history what new results may be derived, even in the most beaten track, from a thorough investigation of the original authorities. His researches have thrown a flood of light over the personal character of Henry the Eighth and his relation to the great event of modern history—the Reformation of Religion in Europe and the British Isles—that it would be in vain to seek elsewhere.

The work has received the most favorable notices from the leading English journals, and has already passed through four editions in England. The vast amount of fresh and authentic materials which the author has brought to bear on the periods of which he writes, give his work an interest and value beyond any previous history of the same events.

IV.

A NEW VOLUME, PART II., OF STANLEY'S JEWISH CHURCH.

LECTURES ON THE HISTORY OF THE JEWISH CHURCH, from Samuel to the Captivity. By A. P. STANLEY, D.D., author of "Sinai and Palestine." 1 vol. 8vo, maps and illustrations, price $5.

The author's familiarity with the sacred sites and unrivalled descriptive powers enable him to harmonize and verify the Scripture into a living and breathing vitality, that forms the best possible answer to the petty cavils of critics and sceptics.

Earnest, eloquent, learned, with a style that is never monotonous, but luring through its eloquence, the lectures will maintain his fame as author, scholar, and divine. We could point out many passages that glow with a true poetic fire, but there are hundreds pictorially rich and poetically true. The reader experiences no weariness, for in every page and paragraph there is something to engage the mind and refresh the soul.—*London Critic.*

V.

NEW BOOK BY C. L. BRACE.

SHORT SERMONS TO NEWSBOYS; with a history of the formation of the Newsboys' Lodging-House. 1 vol. 16mo, with illustrations; 250 pages, $1 50.

VI.

TEMPERANCE—RECOLLECTIONS, LABORS, DEFEATS, TRIUMPHS. An Autobiography. By Rev. JOHN MARSH, D.D., Secretary to the three first National Temperance Conventions, and thirty years Corresponding Secretary and Editor of the "American Temperance Union." 1 vol. 12mo, 350 pages, $2.

VII.

NEW BOOK BY THE LATE MRS. C. M. KIRKLAND.

PATRIOTIC ELOQUENCE: Being selections from One Hundred Years of National Literature. Compiled for the use of Schools in Reading and Speaking. 1 vol. 12mo, $1 75.

Copies sent by mail, *post-paid*, on receipt of price by C. S. & Co.

NOW READY.

FOR SALE BY PRINCIPAL BOOKSELLERS.

LAYS OF THE SCOTTISH CAVALIERS.

By WILLIAM E. AYTOUN,

Late Professor of Literature and Belles-Lettres in the University of Edinburgh, and Editor of "Blackwood's Magazine."

A handsome crown 8vo edition on tinted paper. Price $2 25.

WIDDLETON,

PUBLISHER,

17 MERCER STREET, N. Y.

"Choosing from the ample range of Scottish history occasions which are near and dear to the popular sympathy of his country, Mr. Aytoun, confident of the force of strong convictions and a direct appeal to the elementary emotions of the human heart, has presented us eight noble lays, clear in feeling, simple and direct in expression, and happily varied and variable in measure, which will, we are confident, outlive many, if not all, of his more pretentious and ornamental contemporaries."—*London Athenæum.*

ALSO,

THE BOOK OF BALLADS.

Edited by BON GAULTIER (Professor Aytoun).

Elegant small 8vo, with illustrations. Price $1 50.

"Bon Gaultier's 'Book of Ballads' is simply the wittiest and best thing of the kind since the 'Rejected Addresses.' Its parodies of Lockhart (in the Spanish Ballads), of Tennyson (his lovely sing-song puerilities), of Macaulay (the sounding Roman strain), of Moses (the 'puff poetical'), are, with a dozen others, in various ways, any of them equal to the famous Crabbe, and Scott, and Coleridge of the re-ascending Drury Lane."—*Literary World.*

Mailed, post-paid, on receipt of price.

*** Catalogue of entire list of publications mailed on receipt of postage-stamp for same.

REMOVAL.

MESSRS. GEORGE ROUTLEDGE & SONS,

129 GRAND STREET, NEW YORK,

Will shortly remove from their present location to more commodious premises on the ground floor at

416 Broome Street,

(CORNER OF ELM ST.)

Messrs. George Routledge & Sons have for sale a few copies of

THE IMPERIAL DICTIONARY OF UNIVERSAL BIOGRAPHY. A series of original memoirs of distinguished men, with numerous fine steel portraits. 6 vols. imperial 8vo, cloth, $90.

A NEW AND CHEAPER EDITION OF

STONEHENGE ON THE HORSE IN THE STABLE AND THE FIELD, with 170 Engravings by Barrand, H. Weir, and others. 1 vol. demy 8vo, cloth, $6.

FROISSART'S CHRONICLES of England, France, Spain, and the adjoining Countries, with a Life of the Author, and many illustrations. 2 vols. royal 8vo, cloth, $12.

MEN OF THE TIME, a Biographical Dictionary of eminent living characters of both sexes; a new edition, revised and brought down to the present time. 860 pages, post 8vo, half bound, $6.

LANE'S ARABIAN NIGHTS ENTERTAINMENTS. A new edition. Illustrated with many hundred engravings from designs by William Harvey. 3 vols. 8vo, cloth, $15; half calf, $20; full calf, $25.

GEORGE ROUTLEDGE & SONS,

Broadway, Ludgate Hill, London.

129 Grand Street, New York.

TWO NEW BOOKS,

PUBLISHED THIS DAY.

LEIGHTON COURT. A Country-house Story. By HENRY KINGSLEY, author of "Geoffry Hamlyn," "Ravenshoe," etc. 1 vol. 16mo, $1 50.

The vigor of this story, its graphic descriptions of character and scenery, and the deep interest it excites, justify the following high praise of a careful critic:

"Mr. Henry Kingsley is to be welcomed among the masters of modern fiction. He knows the world; he has shrewd opinions; he has an artist's eye for a bit of landscape, with a sea-view, a trout-brook, or a great waving forest; he draws characters warm and natural, as people we know, and the incidents and situations of his story are vivid and well managed."

HONOR MAY. A Novel. 1 vol. 16mo, $2.

This book possesses much interest for all intelligent readers, but will be specially attractive to lovers of music. The heroine is an enthusiastic musician, and tries to give the world a better knowledge of what music really is. The story of her devotion to her art, and of her social experiences, is full of healthy suggestions.

*** Sent post-paid on receipt of price.

FINANCIAL REVIEW.

NATION OFFICE, Saturday Evening, April 7, 1866.

THERE has been no further decline in gold or merchandise since we last wrote. The former continues to fluctuate between 127¼ and 128½; this evening it closed at 127⅝. Merchandise continues extremely dull; general business is still smitten with paralysis. Buyers from the country are going home, having made far lighter purchases than usual. So long as money remains easy, holders of goods do not care to sacrifice them, and merchandise which cannot be sold for something like cost is being generally withheld from market. Exchange continues very weak and difficult to sell. The best bankers' bills are offered at 106¼, and fair commercial bills against cotton at 105 to 105½. At these rates gold is pretty sure to be sent here from London. It is estimated that fully a million bales of cotton, worth in Liverpool £30 a bale, will go forward to Europe during the remaining months of this year. Should the markets for foreign goods remain as dull as they are, the fall importations will be light, and in this case there would seem to be no good reason why exchange should improve. Many have expected that the decline in gold on this side, and the firmness of the United States stocks, would lead to importations of 5-20 bonds from Europe. Thus far no considerable parcels have arrived, and, on the contrary, small orders for European account come to hand every week. Five-twenties have not yet advanced above 72 in the London market, but letters from thence predict a further rise within a brief period.

Money has become a shade more active in consequence of the increased business in stocks and gold. On call the rate is about 6 per cent.; first-class paper sells at 7. No further progress has been made with the loan bill in Congress. It has been reported from the Finance Committee in the shape in which it passed the House, and it seems to be understood that it will pass the Senate in that form. Mr. McCulloch's friends deeply regret the pros-

pect, but console themselves with the reflection that though the Secretary is forbidden to "retire and cancel" more than $18,000,000 of currency before December 1, there is nothing which prevents his accumulating $100,000,000 in the Sub-Treasury, and so practically reducing the currency by that amount. Such a withdrawal of legal tenders would go far towards bringing down gold towards par. So far from helping the manufacturing interests by their hostility to resumption, the paper money party in Congress will soon discover that they have merely postponed for a few months an inevitable trouble, and that these few months will be a period of stagnation in trade and grave embarrassment in industrial circles.

The following table will show the course of the stock, gold, exchange, and money markets during the week:

	March 31.	April 7.	Advance.	Decline.
United States Sixes of 1881	105	104¾	....	¼
5-20 Bonds, old	104¼	104	...	¼
5-20 Bonds of 1865	104¼	104	....	¼
10-40 Bonds	92⅜	91⅛	....	⅜
7.30 Notes, second series	100¾	99⅞	....	⅜
New York Central	90⅝	92¾	2⅛	....
Erie Railway	74⅛	79	4⅛	....
Hudson River	108	110	2	....
Reading Railroad	99¼	101¾	2½	....
Michigan Southern	83⅛	81⅛	....	2
Cleveland and Pittsburgh	76¾	80⅛	3¾	....
Chicago and North-western	26¼	26⅛	⅛	....
" " " Preferred	54⅛	55⅛	1	....
Chicago and Rock Island	111⅛	116	4¼	....
P., Fort Wayne, and Chicago	88¾ ex. d.	90¾	2	....
Canton	47	48	1	....
Cumberland	43	43⅛	⅛	....
Mariposa	11⅜	11¾	⅜	....
American Gold	127¾	127⅞	....	⅜
Bankers' Bills on London	107	106¾	....	¾
Call Loans	6	6	....	....

Governments are generally a fraction lower, the advance of last week being lost. At or about par there are naturally a great number of seven-thirties for sale, and the reaction in these stocks affects the others.

The leading feature of the stock market this week has been the culmination of the corner in Michigan Southern. The clique succeeded on Wednesday in buying up all the capital stock, and on that day and on Thursday the bears were unable to make their deliveries. On Wednesday 4 per cent. and on Thursday 15 and even 20 per cent. was paid for the use of stock for a single day. The price of cash stock rose to 107, and at the same time the clique was willing to supply the market at 84 to 85, seller three. On Thursday it sold at 105 cash and 86 regular. How much stock the clique succeeded in selling is only known to themselves. If they sold the bulk of the stock they had previously bought, they have done well, and have made money by the corner. If they have only sold one-quarter or one-third of what they had previously bought, it is yet an open question whether they will make anything by the operation. Meanwhile, there is no question but that the bears have lost heavily. A large number of short contracts were closed on Wednesday by purchasers of stock, seller three. These contracts only matured to-day, and to fulfil them meantime the bears were compelled to buy cash stock, which they had to sell out at a loss of 10 to 20 per cent. Hardly ever has the Street undergone so cruel an experience. Angry discussions on the subject have taken place in both Boards and in the Street, and various opinions have been ventilated. It is clear that a man who undertakes to sell that which he has not got, takes the chances of being able to get it, and cannot complain if some one steps in before him and buys up the property which he has contracted to deliver. At the same time, the feeling in Wall Street against "corners" is general. They are regarded as illegitimate operations, not within the purview of fair trading. No man in Wall Street who has been prominent in a "corner" has ever enjoyed the subsequent confidence of the Street. Men who "corner" stocks are regarded as sharpers, who inflict heavy loss on the Street with a doubtful prospect of gain to themselves. In this Michigan Southern "corner" two of the three prominent managers are said to have been notorious bankrupts, whose paper is in every man's pocket-book, and the third a prominent official of the road, whose speculations have been so flagrant that a bill has been introduced into the Legislature to check them. To be fleeced at all is unpleasant; to be fleeced by such men is an aggravation of the injury. It is not unlikely that the transactions growing out of this "corner" may give rise to lawsuits. In this case the Street may receive some new light on the general subject. Among lawyers the opinion is general that purchases made by a clique with a view to corner a stock are illegal and void. For instance: A and B have bought up all the Michigan Southern in existence. They own it, and have it in their trunk or coming to them from good parties. Under these circumstances, of which the public are ignorant, they go into the market and bid for 5,000 shares more. Speculators ignorant of the facts supply the bid. The courts may possibly hold, under these circumstances, that the purchases were void—the article bought not being in existence, and the buyer knowing the fact while the seller did not. A pleasant feature of this corner has been the punishment of the leading director of the Erie—himself a leading cornerer—especially in his own stock. He was "short" of Michigan Southern, though he strenuously denied it to all comers. In the same hour in which he gave money to found Methodist churches for the purification of the morals of the people, he assured every one that he had not sold one single share of Michigan Southern. Yet, when the "twist" came, it turned out that he owed 2,300 shares to the "cornerers." This stock he refused to deliver. Forgetful of the fierce and relentless manner in which he had insisted on deliveries when he was "cornerer," and not "cornered," he no sooner found himself caught than he went to Judge McCunn and got injunctions out—one to the president of the Stock Exchange against buying in his stock; another to the parties to whom he owed it against trying to get it; and finally a third to his own broker against paying the difference. Luckily for the credit of brokers, nobody paid the least attention to the injunctions. The creditor demanded that the stock be bought in, the vice-president of the Board bought it in, and the broker of the Erie director paid the difference. People generally are greatly rejoiced at this feature of the contest. No man has so frequently cornered the Street and inflicted losses on speculators and brokers as the Erie director. No man in the hour of trouble has been more relentless and unforgiving than he. And though the public generally have but little sympathy with the parties who cornered Michigan Southern, everybody is glad to have "the biter bit" for once. If now a court of justice would declare the leading speculative director of the Michigan Southern responsible to all buyers of that stock for the damage they have suffered by reason of his speculations—as was done in Great Britain in the case of Hudson—the public would feel generally satisfied.

Terrified by the severe punishment administered in the Michigan Southern corner, the bears have been actively engaged ever since in covering their contracts on other stocks. Thus we note a general advance in railway securities of from 2 to 4 per cent. More corners in Erie, in Pittsburgh, in Fort Wayne, and in Reading are predicted. Meanwhile the Street operators are gradually "getting long" of these stocks, and the public is not buying them. On the railways business is too light to warrant much hopes of large dividends this year, and the bulk of the floating stock will naturally come into Wall Street.

IMPORTANT CHANGE IN THE DIVIDEND PERIODS

OF THE

EQUITABLE

LIFE ASSURANCE SOCIETY

OF THE

UNITED STATES,

92 BROADWAY, NEW YORK.

ACCUMULATED FUND.....$2,000,000.

ANNUAL INCOME.....$1,000,000.

PURELY MUTUAL.

ANNUAL CASH DIVIDENDS.

At the request of their numerous policy-holders, this Society have determined to declare their dividends ANNUALLY IN CASH: the first Dividend will be declared February 1, 1867. The last Dividend declared on the quinquennial plan reduced the premiums in some cases more than 50 per cent., or doubled the policy during the next dividend period. It is believed, for the future, that no Company in this country will be able to present greater advantages in its dividends to persons assuring than this Society, as its total expenditure to cash premium received was, by the last New York Insurance Report, less than that of any of the older American Life Insurance Companies.—*See Superintendent Barnes's Annual Report*, 1865.

The new business of this Society for the past year ($13,623,900) exceeds the new business of any New York Company in any previous year.—*See Superintendent Barnes's Annual Report*, 1865.

Hereafter Dividends on the first annual premium may be used as Cash in the payment of the Second Annual premium, and so on thereafter the dividend on each premium may be applied to the payment of the next succeeding premium. Policy-holders in most other Companies MUST WAIT FOUR OR FIVE YEARS before any advantage can be derived from Dividends.

The success of this Society has not been equalled by any Company either in this country or Europe, the Society's cash accumulation being over

ONE MILLION OF DOLLARS

greater than the most successful Company at the same period in its history, and its annual cash revenue from premiums, at the end of its sixth year, was greater than that of the largest company in the country at the end of its fifteenth.

Non-Forfeiture of Premiums.

In the case of whole life and endowment policies at ordinary ages in force for at least three years, the Society will, on due surrender, issue a Paid-up Policy for the full amount of premiums paid.

The Company will issue Policies on a single life to the extent of $25,000, but only in cases where the physical condition and family history of the applicant are entirely unexceptionable.

Permission is given at all times to visit Europe free of charge.

Extra Permits granted at moderate rates.

NEW FEATURES—NEW TABLES,

By which all Policies are NON-FORFEITING and ENDOWMENT, payable at about the same cost as ordinary Life and Ten-Payment Policies payable at death only. We call special attention to these Tables as exceedingly attractive and ORIGINAL with the UNION. In case payments are discontinued, after two premiums have been paid, the Company contract to pay, AT DEATH or the SPECIFIED AGE, an amount in proportion to the number of premiums paid.

The Percentage system of Dividends used by this Company affords greater protection to the family than any other plan, as in event of an early death the amount of policy paid is twice that paid by all cash Companies with the same cash outlay of premiums.

The greatest possible liberality in assisting parties to keep their Policies in force.

Liberality and promptitude in the settlement of claims.

We refer to the Massachusetts and New York Insurance Commissioners' Reports for 1864 and 1865 as an evidence of the Safety, Reliability, and Unparalleled Success of the Union Mutual.

J. W. & H. JUDD, GENERAL AGENTS.

☞ Active and efficient AGENTS wanted. Apply as above.

LIFE AND ACCIDENTS.

THE NATIONAL LIFE

AND

TRAVELLERS' INSURANCE CO.,

243 BROADWAY, NEW YORK,

EDWARD A. JONES, PRESIDENT,

Issues

LIFE POLICIES ON THE PURELY MUTUAL PLAN,

And Ensures Against

ACCIDENTS OF EVERY DESCRIPTION.

It issues two kinds of travelers' tickets, one covering only accidents to the vehicle, and the other every kind of accident. Both pay a weekly compensation in case of accident causing total disability.

Travelling Accidents—For 24 hours, 10 cents for $3,000, with $15 per week compensation.

General Accidents—For 24 hours, 25 cents for $5,000, with $25 per week compensation.

General Accidents—Yearly Policy, $25 for $5,000, with $25 per week compensation.

FIRST CLASS FIRE INSURANCE

ON THE PARTICIPATION PLAN.

MARKET FIRE INSURANCE COMPANY

87 WALL STREET, CORNER OF JAUNCEY COURT.

CONDITION OF THE COMPANY.

ABSTRACT OF THE ANNUAL REPORT OF DEC. 31, 1864.

TOTAL ASSETS		$414,729 18
Viz.—Bonds and Mortgages	$134,672 00	
Temporary Loans	92,630 00	
Real Estate	10,000 00	
100 Shares Mer. Ex. Bank	5,000 00	
Government Sec., value	144,514 00	
Cash on hand	18,642 34	
Interest due	3,085 58	
Premiums due	6,785 26	
PRESENT LIABILITIES	$15,995	
NET SURPLUS	198,733 26	

This Company will continue, as heretofore, to insure respectable parties against

DISASTER BY FIRE

At fair and remunerating rates; extending, according to the terms on its Policies, the advantage of the

PARTICIPATION PLAN OF THE COMPANY,

pursued by it for several years past, with such great success and popularity, and profit to its customers: whereby

(75) SEVENTY-FIVE PER CENT. (75)

of the Profits, instead of being withdrawn from the Company in Dividends to Stockholders, is invested as a "SCRIP FUND," and held for greater protection of its Policyholders; and Scrip, bearing interest, is issued to Customers therefor: thus, IN THIS COMPANY, those who furnish the business, AND PAY THE PREMIUMS, derive the largest share of advantages; and when the accumulations of the SCRIP FUND shall exceed

FIVE HUNDRED THOUSAND DOLLARS,

the excess will be applied to PAY OFF the Scrip IN CASH in the order of its issue.

☞ The liberal and prompt adjustment of Claims for Loss, WHEN FAIR AND SQUARE, is a specialty with this Company.

NOTE.—This Company does not insure on the hazards of RIVER, LAKE, or INLAND NAVIGATION; confining itself strictly to a legitimate FIRE INSURANCE BUSINESS.

ASHER TAYLOR, President.

H. P. FREEMAN, Secretary.

OFFICE OF THE ATLANTIC MUTUAL INSURANCE CO.,
New York, January 27, 1866.

The Trustees, in conformity to the Charter of the Company, submit the following

Statement of its Affairs on the 31st December, 1865:

Premiums received on Marine Risks from 1st January, 1865, to 31st December, 1865		$6,933,146 80
Premiums on Policies not marked off 1st January, 1865		2,019,324 73
Total amount of Marine Premiums		$8,952,471 53
No Policies have been issued upon Life Risks, nor upon Fire Risks disconnected with Marine Risks.		
Premiums marked off from 1st January, 1865, to 31st December, 1865		$6,764,146 38
Losses paid during the same period	$3,659,178 45	
Returns of Premiums and Expenses	$992,341 44	
The Company has the following Assets, viz.:		
United States and State of New York Stock, City, Bank, and other Stocks		$4,828,585 00
Loans secured by Stocks and otherwise		3,330,350 00
Real Estate and Bonds and Mortgages		221,260 00
Dividends on Stocks, Interest on Bonds and Mortgages and other Loans, sundry notes, re-insurance, and other claims due the Company, estimated at		144,964 43
Premium Notes and Bills Receivable		3,283,801 96
Cash in Bank, Coin		80,462 00
" " U. S. Treasury Note Currency		310,551 78
Total Amount of Assets		$12,199,975 17

Six per cent. interest on the outstanding certificates of profits will be paid to the holders thereof, or their legal representatives, on and after Tuesday, the Sixth of February next.

Fifty per cent. of the outstanding certificates of the issue of 1864 will be redeemed and paid to the holders thereof, or their legal representatives, on and after Tuesday, the Sixth of February next, from which date interest on the amount so redeemable will cease. The certificates to be produced at the time of payment, and cancelled to the extent paid.

A dividend of Thirty-Five per cent. is declared on the net earned premiums of the Company, for the year ending the 31st December, 1865, for which certificates will be issued on and after Tuesday, the Third of April next.

By order of the Board, J. H. CHAPMAN, Secretary.

WILLIAM KNABE & CO.'S

Celebrated Gold Medal

GRAND, SQUARE, AND UPRIGHT

PIANOS.

These instruments have been for thirty years before the public, in competition with other instruments of first class makers. They have, throughout that long period, maintained their reputation among the profession and the public as being unsurpassed in every quality found in a first-class Piano.

650 BROADWAY,

AND

CROSBY'S OPERA HOUSE, CHICAGO, ILL.

J. BAUER & CO., Agents.

DECKER & CO.,

MANUFACTURERS OF PIANO-FORTES,

419 BROOME STREET,

One Block East of Broadway, N. Y.

These Pianos stand unrivalled in regard to their singing quality; volume and purity of tone; sympathetic, elastic, and even touch; and durability of construction, which enables them to remain in tune much longer than ordinary Pianos.

The Horace Waters

Grand, Square, and Upright PIANOS, MELODEONS, HARMONIUMS, and CABINET ORGANS. Wholesale and retail, at reduced prices. To let, and rent allowed if purchased. Monthly payments received for the same. Second-hand Pianos at bargains, prices $60, $75, $100, $125, $150, $175, $200, and $225. Factory and Warerooms, 481 Broadway. Cash paid for second-hand Pianos.

Improvements in Piano-fortes.

One of the simplest and most truly valuable improvements yet made in the Piano-forte is that invented and patented by

DECKER BROTHERS, 91 BLEECKER STREET,

in this city. By correcting the only imperfections arising from the use of the full iron-plate, and that, too, by not detracting in the slightest degree from its many positive advantages, the Messrs. DECKER have developed in their instruments a tone at once admirable for its purity, fulness, prolongation, and sweetness, and the high estimation in which their improvement is held is well shown in the rapidly increasing business of their firm.—*Tribune.*

MARVIN'S

PATENT FIRE AND BURGLAR SAFE:

Superior to any others in the following particulars:

They are more fire-proof.

They are more burglar-proof.

They are perfectly dry.

They do not lose their fire-proof qualities by age.

OUR No. 700 STRAWBERRY PLANTS BY MAIL.

Good Investment.

We will send by mail, post-paid, and guarantee their safe carriage, 25 good strong plants for $5; 60 for $10. By express 100 plants for $15; 1,000 for $100. Each plant, with ordinary care, will produce 100 additional the first season. An outlay of $5 will secure in six months 2,000 plants; $10, 6,000 plants. As but few plants of this remarkable Strawberry have been disseminated, the demand, for some years to come, at high prices, will be very great. The most PROFITABLE time to secure valuable new varieties is when they are FIRST INTRODUCED.

THE BEST SEWING-MACHINES IN THE WORLD.

THE WEED MACHINES,

With all their valuable improvements, entirely overcome all imperfections. They are superior to all others for family and manufacturing purposes, simple in construction, durable in all their parts, and readily understood. They have certainty of stitch on all kinds of fabrics, and are adapted to a wide range of work without change or adjustment, using all kinds of thread. Will hem, fell, bind, gather, braid, tuck, quilt, cord, and, in fact, do all kinds of work required by families or manufacturers. We invite all persons in search of an instrument to execute any kind of sewing now done by machinery to inspect them, and recommend all parties engaging in the sale of sewing-machines to make sure they secure the best by examining the WEED before purchasing. They make the shuttle-stitch, which cannot be excelled for firmness, elasticity, durability, and elegance of finish. They have received the highest premiums in every instance where they have been exhibited in competition with other standard machines. The company being duly licensed, the machines are protected against infringements or litigation.

Reliable agents wanted, to whom we offer great inducements. Every explanation will be cheerfully given to all, whether they wish to purchase or not. Descriptive circulars, together with specimens of their work, will be furnished to all who desire them by mail or otherwise.

For $10 (No. 1), 2 doz. Triomphe de Gand, 2 doz. Wilson, 2 doz. Fillmore, 2 doz. Russell, 2 doz. Golden Seeded, 2 doz. Georgia Mammoth, 2 doz. Green Prolific, 2 doz. Lady Finger, 2 doz. Lenning's White, 1 doz. Agriculturist.

Or (No. 2), 2 doz. Jucunda—our No. 700—2 doz. Agriculturist, 2 doz. Golden Seeded, and 1 doz. Lenning's White.

For $20 (No. 1), 4 doz. Triomphe de Gand, 4 doz. Wilson, 4 doz. Fillmore, 4 doz. Russell, 4 doz. Golden Seeded, 4 doz. Georgia Mammoth, 4 doz. Green Prolific, 4 doz. Lady Finger, 2 doz. Jucunda—our No. 700—and 2 doz. Agriculturist.

Or (No. 2), 4 doz. Jucunda—our No. 700—4 doz. Agriculturist, 2 doz. Golden Seeded, 2 doz. Russell, 2 doz. Triomphe de Gand, 2 doz. Wilson, and 1 doz. Lenning's White.

Or (No. 3), 4 doz. Jucunda—our No. 700—4 doz. Agriculturist, 4 doz. Golden Seeded, 2 doz. Russell, 2 doz. Fillmore, and 1 doz. Lenning's White.

GRAPE VINES.

The most popular grape in the country, and the grape being now more generally planted than any other, is the CONCORD. We can furnish 1, 2, and 3 year old vines of very superior quality.

HARTFORD PROLIFIC is the best *very early* grape yet thoroughly tested.

CREVELING is not so early by a few days, but of superior quality, and good for both wine and the table. We offer this season 10,000 Vines of this excellent grape.

Our Stock of all the leading kinds is large and superior. For prices see Catalogue. Sent for 10 cents.

SELECT LISTS OF GRAPES

(NOT BY MAIL).

For $5 we will furnish No. 1 vines, 12 Concord, 3 Delaware, and 1 Hartford Prolific.

For $10 we will furnish 24 Concord, 4 Delaware, 4 Creveling, 1 Hartford.

For $25 we will furnish 48 Concord, 12 Delaware, 12 Creveling, 1 Union Village, 4 Hartford.

For $50 we will furnish 100 Concord, 24 Delaware, 12 Hartford, 12 Creveling, 1 Union Village, 3 Iona, 2 Israella.

For $100 we will furnish 300 Concord, 24 Delaware, 12 Hartford, 24 Creveling, 6 Iona, 2 Israella, 1 Martha, 1 Black Hawk.

RASPBERRIES.

We are prepared to furnish plants of the HORNET, PILATE, IMPROVED BLACK CAP, and fifteen other kinds.

Select Lists of Raspberries

(*not by Mail*).

For $5 we will furnish 1 doz. plants Hornet, 1 doz. Pilate, 1 doz. Brinckle's Orange, and ½ doz. Improved Black Cap.

For $10 we will furnish 1 doz. Hornet, 1 doz. Pilate, 1 doz. Imperial, 1 doz. Brinckle's Orange, 1 doz. Improved Black Cap, 1 doz. White Cap, 1 doz. Allen's Hardy, ½ doz. Purple Cane.

Select Lists of Blackberries

(*not by Mail*).

For $10 we will furnish (No. 1), 100 each of the New Rochelle and Dorchester and 12 Newman's Thornless.

Or (No. 2), 100 New Rochelle, 12 Dorchester, 12 Newman, 1 Wilson's Early, and 1 Kittatinny.

CURRANTS.

Having given much attention to securing a good stock of Currants, we are able to furnish, in any quantity, all the old and new kinds, including: CHERRY, WHITE GRAPE, VERSAILLAISE, FERTILE DE ANGERS, VICTORIA, BLACK NAPLES, etc.

SEND FOR OUR CATALOGUE.

We are constantly receiving very many letters of enquiry in reference to the culture of SMALL FRUITS. The information sought after is contained in the NEW EDITION of our CATALOGUE, which will be sent to all applicants enclosing 10 cents. It is furnished at less than cost, and is worth ten times the amount to all interested in the subjects of which it treats.

STEINWAY & SONS'

GRAND, SQUARE, AND UPRIGHT PIANO-FORTES

Have taken Thirty-two First Premiums, Gold and Silver Medals, at the Principal Fairs held in this country within the last ten years, and in addition thereto they were awarded a First Prize Medal at the Great International Exhibition in London, 1862, in competition with 269 Pianos from all parts of the World.

That the great superiority of these instruments is now universally conceded is abundantly proven by the FACT that Messrs. Steinways' "scales, improvements, and peculiarities of construction" have been copied by the great majority of the manufacturers of both hemispheres (AS CLOSELY AS COULD BE DONE WITHOUT INFRINGEMENT OF PATENT RIGHTS) and that their instruments are used by the most eminent pianists of Europe and America, who prefer them for their own public and private use, whenever accessible.

STEINWAY & SONS direct special attention to their

PATENT AGRAFFE ARRANGEMENT,

which, having been practically tested in all their grand and highest-priced Square Pianos, and admitted to be one of the greatest improvements of modern times, will hereafter be introduced in EVERY PIANO MANUFACTURED BY THEM WITHOUT INCREASE OF COST to the purchaser, in order that ALL their patrons may reap its benefits.

STEINWAY & SONS' PIANOS are the only American instruments exported to Europe in large numbers, and used in European concert-rooms.

WAREROOMS, 71 & 73 EAST FOURTEENTH ST between Union Square and Irving Place, New York.

JOSEPH H. RICHARDS, PUBLISHER, 130 NASSAU STREET, N. Y.

The Week.

THE NATION will hereafter be issued twice a week, on Wednesdays and Saturdays, beginning with the number of May 2d, each number containing sixteen pages, half the present quantity. We have been compelled to make this change in order to secure greater freshness for our comments on political and commercial topics. At present the paper does not reach our subscribers in the West until nearly a week after it has gone to press. Under the new arrangement we shall be able to bring our financial and political review down to the evening before publication, and thus meet the wishes of readers at a distance, from whom we have received many remonstrances on this subject.

Some slight changes in the arrangement of articles will also be necessary to meet the requirements of more rapid printing, but the character and appearance of the paper will, of course, remain the same.

The great reduction which has lately taken place in the cost of paper, and which is now almost certain to continue, will enable us, we are glad to say, to reduce the subscription to five dollars a year.

We have always hitherto been chary about inflicting on the public anything which savored of self-laudation, or troubling it with statements about the position and prospects of the paper, which can, of course, have comparatively little interest for anybody but the proprietors. What most concerns readers, is not what we promise, but our manner of performing, and of this they have in their own hands the means of judging. The difficulties of starting such an enterprise as that in which we are engaged, and which in some ways breaks through the most sacred traditions of the newspaper world, are greater than most people imagine, and if we had not during the nine months of its existence received a good deal of hearty abuse we should have been greatly surprised. We owe it to ourselves to mention, however, that we have received and continue to receive from the ablest and most eminent men in the country, of all professions and persuasions, expressions of commendation of THE NATION and of its mode of discussing public questions so hearty, and often so enthusiastic, that it would be impossible on reading them not to feel that we have achieved a genuine success, that we really have done something towards raising the standard of American criticism, and towards showing that no cause is too good to be defended with candor, common sense, and fairness to opponents.

THE situation at Washington has considerably improved since the passage of the civil rights bill. With it, the political crisis may be fairly said to be over. It is impossible not to see in Mr. Johnson's course of late a strong attempt at reaction, which Congress has now resolutely and completely foiled. It is difficult to over-estimate the good effects of its recent vote. It has in the first place dissipated the hopes which the "bummers" of the Republican wing at the North were beginning to entertain of the formation of a "third party," with Andrew Johnson for its head, with the plunder and the pay for themselves. All the ambitious postmasters and custom-house officers will now probably relapse into tranquillity. It has in the next place disabused the mind of the President as to the extent of his own powers. How far others were responsible for the delusion under which he has been laboring for some months, that he was the United States, and that the function of Congress was like that of the Parliament of Paris, the registering of executive edicts, we are unable to determine. But that he did labor under this delusion, or one very like it, is tolerably clear. It has in the third place opened the eyes of the South as to the real sentiments of the Northern public, and as to the real seat of power at Washington. It now knows that the adhesion of Mr. Johnson to its views is not all it needs to make things pleasant. It is but just to him to say that he, as far as we can learn, takes his defeat in perfectly good humor. The talk of a *coup d'état*, which is kept up by the copperhead papers, and which some radical journals are foolish enough to re-echo, as if they believed it, may be safely set down as malignant nonsense. The equally foolish talk of impeaching the President generally, we believe, emanates from people who are not quite sure what impeachment means, or have a vague notion that it is some kind of very awful moral censure, like the Roman Catholic practice of "cursing with bell, book, and candle." Nor is there any likelihood that Congress will sit through the summer. This is another sensational story at which the ablest Congressional leaders only laugh. There is at present no probability that anything will be done or attempted by the President to make this necessary. He has found himself at the late trial of strength so very weak, that there is every reason to believe he will, hereafter, avoid everything that is likely to bring on a collision between himself and the legislature. Congress has as yet resolved upon no plan of reconstruction that can be called final, but there is good ground for hoping that in a very few weeks it will be able to agree on something which will satisfy reasonable men of all parties. The scheme which at present seems to find most favor is a combination of Mr. Stewart's proposition with that of Mr. Robert Dale Owen—that is, an offer of admission and oblivion to the South in return for the adoption of an amendment admitting all classes to the franchise, not immediately, but say in ten years, subject, perhaps, to some intelligence test.

The President has for some time past thought proper to dispense with the advice of Northern men, and has thrown himself upon that of Mr. Sharkey, of Mississippi, and one or two other Southerners. This would have been all very well if the solution of the problem were to be left in the hands of the Southern people. It is now pretty plain that there is no hope of this, and that the Northern public has really the assurance to believe that the sacrifices of a bloody war do give it a right to be heard on the re-establishment of the Union they have

saved. We trust the President will now see the desirableness of consulting their leaders also.

THE Fenian excitement on the Canadian border continues. When active operations are to commence, nobody seems to know, but as the Brotherhood has hired a hall in Portland to hold public meetings in, we doubt if the tongue is not intended to do most of the fighting for some time to come. In the meantime, a small party has gone off and captured a British flag which was flying on an island where there were no soldiers. This may be ominous of the awful storm that is coming, but we doubt if the British will be as much alarmed by it as they ought to be. In the meantime, there are symptoms that Mr. Seward is getting restive under the Fenian infliction, and we should not be surprised if the circles woke up some fine morning and found a proclamation launched at their heads from Washington.

THOSE who know anything of New York, with its dwelling-houses at one end of the city only—places of business at the other—can form some idea of the inconvenience occasioned by the strike of the car-drivers, which, as we write, is still pending. The companies declare solemnly that they pay as much as they can afford, and more than they can afford to pay and leave the stockholders a reasonable interest on their investment. But the sympathy of the public and of the newspapers is unmistakably with the drivers; not because the public knows much, or, in fact, anything, about the merits of the quarrel, but because everybody detests the companies for their greed, their indifference to public comfort, and the determination they have always displayed to give nothing for the money they receive that they can possibly withhold. With the differences between them and their servants, the people who use the cars have really nothing to do as long as the cars run, but the companies are bound to run the cars, no matter what they have to pay for drivers; and the coolness with which they haul off their vehicles because they consider the demands of their servants unreasonable, is one of the most striking illustrations we have yet had of the firmness of their faith that the roads are their private property, and that it is for them to decide how they shall be managed. For our part, we confess that we are on the whole glad of every occurrence, however much inconvenience it may entail, which helps to fix the attention of the country upon the evil effects of the system of granting a monopoly of the public highways to money-making corporations. It is in this, and not in the depravity of directors or presidents, that the root of our railroad troubles is to be found after all. Some means must be devised, sooner or later, either of throwing railroads open to competition or else of subjecting them to Government inspection that shall not be a sham.

THERE is yet a chance for the President to show that he is not indifferent to the performances which he exacted of the rebel States as essential to reconstruction. Gov. Hamilton says the Texas Convention has satisfied fully only one of these demands. It passed an ordinance exempting all persons from responsibility who, under civil or military authority, had inflicted injury during the war on other citizens of the State. It also carefully excluded the blacks from any share in the educational appliances for which they are to be taxed in common with the white population. Altogether, the state of war seems still to continue in that corner of the Gulf to which the President has refrained from extending his proclamation of peace.

WE hear much less than we did about the negro race dying out. Those parts of the South in which the doctrine, in the abstract, might find the largest number of supporters—say in Mississippi—are so much in want of laborers that the people are half afraid their predictions are coming true. The planters are rushing to Washington, no longer to curse the anti-slavery amendment as the ruin of the South, but to bargain on good terms for as many "perishable" freedmen as can be spared from the District. A Newbern paper, however, thinks the race short-lived, unless precautions to the contrary be taken. What shall they be? Time was when a "free nigger" would have been told to make haste and put himself under some kind master, surrender himself and family to the will of his owner, and attain the proverbial fleshiness and sleekness of a contented slave. The Newbern editor has no advice of that kind to press. His only remedy against decay and ultimate disappearance is "the moral and intellectual culture of the negro." But what a preposterous idea!

THE late Hon. Daniel S. Dickinson narrowly escaped being nominated Vice-President along with Mr. Lincoln in 1864, the fatal objection to him being that New York was already represented in the Cabinet, and Mr. Seward might feel called upon to resign. Had the majority at the Baltimore Convention desired the retirement of the Secretary of State, or been disposed to accept it with equanimity, they would have insisted on Mr. Dickinson. In that case, since he has died a natural death, we should have had not only an "accidency," but an accidency within an accidency.

THE Wisconsin Legislature last week passed resolutions censuring Mr. Doolittle because, disobeying express instructions, he voted against the civil rights bill. They declared, also, that it is the senator's duty to resign at once. There are more theories than one upon the question whether or not a senator of the United States is so far bound to the State whose commission he holds as that he may not set his own judgment against hers. But, however that may be, Mr. Doolittle, who would not be instructed into doing what Wisconsin thought his duty, is not likely to let Wisconsin resolve him out of his seat.

THE Mobilians, the other day, were kind enough to give praises to the President as "the first fearless patriot," and even for the more doubtful virtue of being "the friend of those who support his policy, and the enemy of those who oppose it." It is a pity that looking further we find something that had better have been spared. Major Waltham rises:

"MR. CHAIRMAN: I propose a sentiment. I mean no treason, nor do I mean to revive any memories of the past which ought to be dead and buried. I simply offer the health of a distinguished gentleman. I give you, therefore, sir: *Jefferson Davis*, soldier, statesman, patriot, prisoner. Our tongues may be mute, but our hearts are with him."

As the major evidently did what he says he did not mean, there is not much to be said to him. But is it simple ignorance, or a species of arrogance, or what is it, that prevents such Southern men as he from seeing that of all returns which they can make for the kindness of certain of their friends, their favor and praise are the most ungrateful and embarrassing?

THE Lynchburg, Va., *Republican* has had news of the passage of the civil rights bill over the veto, and considers it "an event deeply to be lamented by the friends of constitutional liberty." The Radicals, it is now certain, "intend to make everything yield to the accomplishment of their diabolical purposes." The *Republican* goes on to describe the policy that Congress will adopt if it can, and the policy that the President can adopt if he will. Congress, then, impeaches the President and excludes the Southern States from representation. The President, on his part, refuses to treat the present "rump" as a constitutional body. He summons by proclamation all the representatives of the people to the national capital, and then recognizes that branch which he regards as complying with the forms and obligations of the Constitution. This would cause a civil war at the North; but the *Republican* is at a loss to see how the conflict can be avoided if the President would arrest the revolutionary tendencies of the time or protect himself in the rights and dignities of his office. This statement of opinions acquires some importance when it is recollected how many *Republicans* there are in the South, and how implicitly some Southern men follow them and obey them. And at any rate here, as in a mirror, may be seen how little they know and what it is they wish.

WE remember to have heard of an ingenious machine out of which, if you put in a live ox, there issued every conceivable product, from a shoulder of beef to a pair of boots or a powder-horn. A Philadelphia company exhibited last week a process by which a poplar-tree, fresh from its native soil, is converted into clear, white, soft paper in the

space of five hours. The discovery is one of the most useful which we have been able to chronicle for a long period, and we only hope that it may be improved and kept in operation against every inducement to sell out to interested rivals.

THE fright occasioned last week by the news that a steamer from Liverpool, with the cholera aboard, had anchored off Halifax, has not been removed by a confirmation of the first report. Whether it be ship-fever or not which occasioned the extraordinary mortality among the passengers of the *England*, a visit from the grim world's navigator is to be looked for "about this time." The Board of Health have drawn up a code which we hope will be enforced long after the cholera shall have disappeared from the country, if not from the face of the earth. The prohibition of the sale of impure meats, vegetables, swill-milk, etc., ought to be perpetual in every city. The Board enact that every dwelling shall afford 1,000 cubic feet of air to every inmate, and, though not in express terms, forbid underground apartments to be used for living purposes. The utility of the following section cannot be questioned, but any one may guess how great is the probability of its being respected:

"No person shall sell or give to any other person (or permit such other person to get, having the right and ability to prevent the same) any intoxicating or exciting drink, when such first-named person may have reason to think or believe that such drink may cause or contribute to danger or detriment to life or health; and no person shall sell or give any intoxicating liquor to any child under twelve years of age."

GOV. EYRE, it appears, is to be classed among the distinguished men of feeble memories who now and then surprise the less forgetful mob. In attempting to justify to the Jamaica commission his treatment of the riot as an insurrection, he could neither produce any documentary evidence nor recall the names of those whose testimony was oral. His examination was about as successful as Gen. McClellan's or Robert E. Lee's in analogous circumstances.

IN accordance with Napoleon's promise to favr industrial and commercial conferences and meetings, the Minister of the Interior has addressed a circular letter to the prefects, charging them to grant the necessary authority in all cases where they are convinced of the sincerity of the application—"if the object is not political; if the gathering is not likely to make trouble." It is the Emperor's desire, says the Marquis de la Valette, to facilitate an economical understanding between labor and capital, in order to develop the resources of the country. We trust to see a speedy outcrop of co-operative societies, not only for the physical melioration of the poorer classes, but for their education in habits of thrift, sobriety, steadiness, and self-reliance, which are the best foundation for political self-government, to which they may at any moment be called.

THERE are evidently two ways of looking at the end of the Roman republic. In Paris, one may choose between the view from the Tuileries and the view from the Academy. The *Constitutionnel* was hasty and unwise enough to espouse the Emperor's side of the difference between himself and the successor of M. Ampère. This was the response which it provoked from Prévost-Paradol:

"The illustrious author of the 'Vie de César' did not conceal in his preface the fact that while narrating the history of his hero, his thoughts were on the head of his family. It is no less natural nor excusable in me that, having to speak of the downfall of Roman liberty, I could not help recalling the misfortunes of my own country."

AMERICA'S true friend, M. Edouard Laboulaye, is the liberal candidate for deputy to the Corps Législatif in the Strasburg district of the Lower Rhine. The *Journal des Débats* entreats the electors to return him in place of the late incumbent, who resigned to stand a re-election. The diminished majority of his opponent would be a success to M. Laboulaye and the cause of civil liberty.

THE election of Mazzini at Messina has been pronounced illegal by a proper committee of the Italian Parliament, and finally by the Chamber itself, by a strong majority. The delicate question was only two days under debate, when, according to the *Nazione*, "the strictly legal reasons why the election ought to be annulled were stated with singular clearness by the Hon. De Filippo, sustained with manly soberness by the Hon. Boggio, confirmed with glowing eloquence by the Minister of the Interior, and repeated and illustrated with admirable fecundity, learning, and acumen by the Minister Guardasigilli." Of course, the republicans were badly used by such antagonists. They did their duty toward the exile, but "in the manner," says the same paper, "of an heir who abbreviates as much as possible the funeral eulogium on a disagreeable relation, and is sparing of his encomiums in proportion to his confidence that the disagreeable relation cannot return to life to disturb the tranquil inheritor." The death-sentence imposed by Sardinia for Mazzini's alleged complicity with the rising at Genoa on the 29th of June, 1857, was the single ground on which the Government relied for its course in this decision. The death-sentence passed by France in 1864 was not brought forward as an obstacle. Now that the law has been re-asserted, it is suggested that Victor Emanuel might do a graceful thing by pardoning Mazzini.

A LITTLE St. Bartholomew was enacted at Barletta, in Italy, on the 19th of last month (St. Joseph's Day), by an infuriated, priest-led mob of Catholics, who assaulted a Protestant school and the home of the Protestant minister, stoning, beating, and slaying *i dannati* with cries of "*viva il papa!*" Women were conspicuous in the bloodiest part of this miserable drama, which included the plundering and burning of other obnoxious dwellings. Seventy-five arrests have been made, and among them four priests, a capuchin, several of the women, and a leading banker, who was also a lieutenant in the national guard. This respectable assassin had drawn up a list, which was found about him, of some two hundred victims. Other documents secured at the same time seem to point to a general infection of the guard itself, and the Government is said to be taking steps to provide it with a guardian. The violence of the clerical party has also been displayed in the neighborhood of Bologna with less deplorable results.

WHETHER Austria's necessity is to be Italy's opportunity, in the approaching conflict of the two great German powers, remains to be seen. There are rumors of an alliance between Italy and Prussia. Austria is said to be strengthening the line of the Adige. Meanwhile Prussia sends a circular to the smaller states of Germany to anticipate their encouragement and support, and, in reply to the admonitions of England and other powers, asserts that the peace of Europe is threatened solely by Austria! The generally expressed solicitude on the part of the crowned heads that the peace should not be disturbed is the best omen for the gain of freedom from an otherwise deplorable struggle. The wave of revolution has hitherto started from Paris. To-day it may begin at Berlin, Vienna, or even Venice.

CONGRESS.

WASHINGTON, April 14, 1866.

THE week has passed without any other significant event of national importance besides the passage of the civil rights bill on Monday in the House. The strength of the vote by which this was done (122 to 41) lends much force to the position of Congress, and means more than a mere partizan triumph over the President. It means an effective check to the spirit of Southern bravado which was becoming rampant again under the supposed shield of the Executive favor. Now that the legislative arm of the Government has caused its power to be felt and respected, it will be less easy for the hot champions of a hasty and disloyal reconstruction to mislead the public mind. Congress stands like a steady and massive rampart between the leaders of the late secession and the political power which they are striving to regain. It does more. It upholds the rights of that proscribed race which was emancipated by the war, and no system which outlaws them from the rights of American citizenship can ever be established so long as the present Congress is sustained by the people.

The civil rights enactment is unquestionably the most vitally

important measure of the session thus far, and its final success already tends to consolidate and unify the majority for agreement upon other measures. It is noteworthy that this measure lost not a single vote in the House, of those who had previously sustained it, in consequence of the veto. On the contrary, it steadily gained in popularity, and no measure which ever passed Congress was ever more firmly fixed in the minds of its supporters. Certainly, no measure of so great importance was ever sustained by such unanimity before, and that, too, in the face of a presidential veto. That this is not owing to any desire to triumph over the Executive is seen no less in the character of the measure than in the well-attested fact that this bill to secure civil rights was approved three months ago by fair-minded Union men in all parts of the South, and even received the sanction of several senators elect from the rebellious States.

A bill is shortly to be considered in the House the purpose of which is to secure the rights of Northern men travelling or residing in the South. It supplies, for the first time, "appropriate legislation" to carry out that clause of the Constitution which provides that citizens of the United States shall be entitled to all the privileges and immunities of citizens in the several States. The bill, which was drawn by Mr. Shellabarger, of Ohio, is not aimed, like Trumbull's civil rights bill (now become a law), at securing the equal rights of colored men, but expressly at securing to Union men in the South those rights of person, property, and of speech which are freely conceded to everybody at the North. The late outrages and persecutions of Northern men and Unionists in several States are the immediate occasion for this measure, and the enactment of a Federal law on the subject is justified by the fact that State laws for their protection are inadequate or unenforced because of the prevalence of a rebel public opinion.

The concurrent resolution which has passed both Houses, prohibiting the sale "or exhibition" of any spirituous liquors, wines, or other intoxicating drinks in the Capitol or other public buildings, is aimed at a gross and disgraceful habit which has prevailed to a greater degree among our public men since the war than ever before. So powerful had this bad custom become, that it is a notorious fact that some of the principal committee-rooms and offices of both Houses of Congress have been converted into "free whiskey-shops," where the bibulous members of Congress could confidently rely upon reinforcing their stomachs with the strongest of alcoholic stimulants. The result could not long be doubtful. Not only was the rule which the most ordinary business prudence prescribes violated, viz., that strong drinks should be excluded from the hours and places devoted to business, but the fruits of this violation became manifest in the occasional tipsiness or chronic "elevation" of sundry legislators who should have known better than to bring discredit on their public station, to say nothing of their private characters. The enactment of this concurrent resolution, which prohibits the "exhibition" as well as sale of spirits, will have the effect, if enforced, to throw honorable gentlemen who are not above getting drunk upon the sufficiently abundant resources of the Washington hotels and restaurants.

DIARY.

Monday, April 9, 1866.—In the Senate, a message was received from the President recommending an extension of time to certain land-grant railroads in the rebellious States. A bill was passed to revise and consolidate all the statutes of the United States, through three commissioners learned in the law, to be appointed by the President and Senate, at a salary of $5,000 each per year, for three years. The loan bill was passed as it came from the House of Representatives—yeas, 32; nays, 7.

In the House, on motion of Mr. Boutwell, the Judiciary Committee was instructed to enquire whether there is probable cause to believe Jefferson Davis and others guilty of complicity in the assassination of President Lincoln, or of treason against the United States, and whether any legislation is necessary to bring them to trial. Also, on motion of Mr. Raymond, a resolution requesting the President to take speedy steps for the trial of Jefferson Davis in Virginia, where he has been duly indicted for treason, was referred to the same committee. A resolution to add 50 per cent. to the duties on imported goods was referred to the Committee on Manufactures—yeas, 106; nays, 50. Mr. Garfield offered a bill to authorize the construction of national railroads. Postponed to December next. The civil rights bill came up for reconsideration upon the veto message of the President, when the previous question was ordered on the passage of the bill, and it was passed—yeas, 122; nays, 41. The Speaker announced that the bill, having received a vote of two-thirds of both Houses of Congress, has become a law.

April 10.—In the Senate, House bill to pay the State of Pennsylvania $800,000 for moneys advanced to the United States for war purposes in 1863 was passed. Also, a bill granting lands to Michigan to aid in constructing a ship canal. Also, a bill to grant lands to Minnesota to aid in construction of the Southern Minnesota Railroad.

In the House, Mr. Deming reported from the Committee on Military Affairs a bill to revive the grade of general in the U. S. Army. Made a special order for April 17. The bankrupt bill came up on the motion to reconsider the vote rejecting the bill, when it was reconsidered—yeas, 83; nays, 45. The question recurring upon the passage of the bill, it was rejected—yeas, 70; nays, 73. A bill to authorize the coinage of five-cent pieces, and prohibiting any further issue of fractional notes of less denomination than ten cents, was passed. Mr. Conkling introduced a new bill to provide for a uniform system of bankruptcy. Referred.

April 11.—In the Senate, a concurrent resolution prohibiting the sale in the Capitol building and grounds of spirituous liquors, wines, and intoxicating liquors of every description, was passed—yeas, 33; nays, 2. A bill was passed appropriating $259,000 for the claims of Kansas for militia called into the U. S. service in 1864.

In the House, a bill to extend for three years the time during which the States now represented in Congress may comply with the terms of the act of 1862, donating public lands to establish agricultural colleges, was passed—yeas, 96; nays, 33. The Senate bill appropriating about seven million dollars to reimburse the State of Missouri for the services of her militia in aid of the Federal Government during the war, was passed—yeas, 68; nays, 25.

April 12.—In the Senate, eulogies were pronounced upon the late Senator Foot.

In the House, the Senate bill to authorize the President to transfer a gunboat to the republic of Liberia was passed. The Senate joint resolution, protesting against the pardon by foreign governments of criminals on condition of their emigrating to the United States, was passed. The Senate resolution, to prohibit the sale of spirituous liquors in the Capitol and grounds, was amended so as to include all the public buildings, and passed. The Senate bill for temporary relief of destitute people in the District of Columbia was passed—yeas, 101; nays, 21.

April 13.—In the Senate, the day was spent upon private bills and sundry amendments to the pension laws. Adjourned to April 16.

In the House, after the passage of several private bills, the bill to re-organize the army of the United States, as reported by the Committee on Military Affairs, was discussed, amended, and laid over.

April 14.—The Senate was not in session. In the House, it was announced that the day was the anniversary of the assassination of President Lincoln, when, after a brief and feeling tribute to his memory by Mr. Garfield, the House adjourned to Monday, April 16.

THE FREEDMEN.

The small-pox amongst the freed people in the District of Columbia is abating. From the recent wholesale whitewashing effected by the Bureau, the quarters of the city occupied by colored people have assumed a neat and cleanly appearance, and the visiting agents, mostly teachers, are encouraging them in neatness and cleanliness. All soup-houses were closed and rations stopped for freed people, except the orphan children, sick, and old, on the 10th inst.—these exceptions being furnished with quarters—the orphans at the Mareil Farm School, near Washington, the sick in hospitals, and the old and infirm at Freedmen's Village. Mr. De Mareil has, with some aid from the Government, established, about two miles from Washington, on the Bladensburg road, a model farm school for colored orphans, both male and female. The capacity of the establishment is for 200 inmates. It is modeled after similar institutions in France and Algeria. Mr. De Mareil is editor and proprietor of the New York *Messager Franco-Américain*. Rev. John Kimball, School Superintendent for the District, reports the number of schools to be 61; teachers, 112; scholars, 6,032; average daily attendance, 4,616; number taught needlework in connection with these schools, 487; number in night-schools, so far as reported, 1,065; in Sabbath-schools, 2,886. There are eight industrial schools in the District, in which, according to the March report, there were 238 women employed, 1,055 garments made, 2,093 garments given away, and $500 worth of garments sold. The N. E. Freedmen's Grocery Store sold during the months of February and March $4,000 worth of goods.

The agent of the Bureau in Fairfax County has established a colored school at Fairfax C. H., but such is the feeling of enmity against it that he is obliged to place a guard at the residence of the lady teacher, to prevent her from being insulted or the school-house burned.

General Sewall has just returned from an inspection tour down the Mississippi. He says that along the river everything is lively, business good, and the demand for labor far exceeding the supply. The colonies established two or three years ago along the river are all broken up, with the exception of the one at Davis's Bend, and this is small. The break-up has been caused by the great demand for labor.

On recommendation of the Commissioner of the Bureau, the Secretary of War has ordered that Major-General Thomas J. Wood, commanding the department of Mississippi, perform the duties of

assistant commissioner, in addition to his duties of department commander. Col. Samuel Thomas, thus relieved, will go on duty at the office in Washington.

General Gregory, when relieved by General Kiddoo, will make a thorough inspection of the State of Texas.

On the islands of Edisto, Wadmalaw, John's, and James, South Carolina, contracts have been made to the number of 2,338.

General Strong, writing from Tallahassee, Florida, gives a very gratifying account of freedmen's affairs in that State. All are at work, and for good wages. He speaks of Governor Walker as a "staunch friend of the freedmen," who will, so far as he is able, see that justice is done. He (General Strong) thinks Florida the most loyal of the Southern States, and he has visited them all. On the other hand, an agent of the Freedmen's and Union Commission reports that a colored man at Gainsville, Florida, was convicted of theft, and sentenced to pay a fine of fifty-eight dollars. In default thereof he was ordered to be sold to the bidder who would take him for the least time, and pay the fine. The bidding was spirited, commencing with five years, and finally ending with five months. At the same place, a short time previous, a similar case had occurred. A colored woman was sentenced to pay a fine of four hundred dollars. Being utterly unable, she was sold into slavery for four years.

Georgia school reports for March show on the 31st of that month 65 schools, 102 teachers, 6,795 pupils. Had not small-pox interfered, the aggregate attendance would have reached 7,500. In six places $398 were paid during the month in support of education by the freed people. In Atlanta, although very poor and greatly scourged by disease, many of them, they contribute every month $200 to the relief of their distressed brethren. In some places public sentiment is growing gradually more favorable to the education of colored people, while in many localities there is persistent opposition to it. In Atlanta the feeling is probably more favorable than in any other locality in Georgia. The schools for whites established there by the Union Aid Commission of Pennsylvania and New Jersey have done much to induce a healthy sentiment by giving the people practical evidence that the charity of the North embraces both races. A Methodist minister in a village in this State recently undertook to teach colored children the catechism, upon which he was informed by his brethren that if he persisted in it his salary would be cut off. Three or four white ladies (widows) have undertaken to teach freedmen's schools, but in every instance at the cost of all their former associations and a complete ostracism from society, in addition to frequent insults from those who were once companions and friends. Last month the freed people's schoolhouse in Madison was destroyed by white incendiaries. The freedmen tried to save the building, but were prevented by white men shooting at them. A considerable number of persons of intelligence and influence acknowledge the importance and *necessity* of universal education, but their fear of public sentiment deters them from advocating and assisting in it openly, boldly, and unequivocally.

Surgeons having freedmen's hospitals in charge have been ordered to establish kitchen gardens, to be worked by the convalescents and attendants when not otherwise employed.

Some benevolent friends of the freed people are about establishing a deaf, dumb, and blind asylum for them, and an official circular has been issued to obtain statistics.

—General Howard has addressed a letter to Mr. Eliot, chairman of the House Select Committee on Freedmen's Affairs, urging, since Congress is not permitted to enlarge the powers of the Bureau, the importance of defining them. He wishes to know its duration, its scope, whether it includes Kentucky and Maryland, what aid is to be given it by reservations of public lands to be sold to the freedmen, what is to be the settlement of the Sea Island controversy, etc., etc. Meanwhile, he has directed the agents of the Bureau to see that the freedmen enjoy the advantages of the civil rights bill.

—A Mississippi newspaper exhorts Southern teachers to take hold of the colored schools at once, on the ground that they can instill into their pupils "Southern ideas of the relative social relations, rights, and duties of the races."

—Numerous planters and agents are in Washington endeavoring to hire freedmen to labor on plantations in Tennessee and Mississippi, and other parts of the South. They will engage them in some instances by the hundred.

—A Georgia judge recently decided that the value of a slave is even now recoverable, provided liability was incurred prior to January 1, 1863; and that not the President's proclamation of that date, but the ordinance of the constitutional convention, abolished slavery in the State of Georgia.

Minor Topics.

The murder of the Deering family in Philadelphia is one other added to the small list of crimes—small, considering what we all feared and might fairly have expected—committed by discharged soldiers. It has probably rarely been surpassed in atrocity, and its success was wonderful. It requires a very remarkable combination of circumstances to enable one or two men even to kill a large family outright. Generally, when slaughter on such a scale as this is attempted, somebody escapes and gives the alarm, or survives to tell the tale. That we have not, during the past year, had to chronicle many incidents of the same sort has surprised most people, and may fairly be considered a very remarkable testimony to the good character of the army which was disbanded last summer. There must have been in its ranks large numbers of men whose notions of right and wrong were a good deal confused by two or three years' familiarity with bloodshed and marauding, and the facility with which they have adapted themselves to the morals of civil life is to us something more singular than the rapidity with which the industry of the country absorbed all or nearly all whom the Government turned adrift. The sudden break-up of such a force would, in any European country, mean the inauguration of beggary and crime on a scale never witnessed since the Middle Ages, and would have spread a panic through the community. Here, beyond two or three murders, a slight increase of robberies, and a slight curtailment of the promenading privileges of young ladies in the neighborhood of the country towns, we have suffered no perceptible inconvenience from it. There has certainly been an increase of blackguardism in railway trains, but how much of this is due to the army it is hard to say.

The Deering murder has been a splendid thing for the Philadelphia reporters. The great descriptive powers of these gentlemen are of course not called out half as often as those of their New York brethren, owing to the greater morality and greater monotony of Philadelphia life. But, perhaps, for this very reason they are better able to "work up" a "great tragedy," when it does come, with even greater effect. They hardly display the same liveliness of imagination as our New York chroniclers. No Philadelphian could ever have seen the awful fight in the fire between Barnum's lions and tigers which was revealed to the enraptured gaze of the reporter of the New York *Tribune*, and we doubt very much whether he could have got at the secret emotions of the elder and of the younger Ketchum, during the few days following the discovery of the great forgeries, with the keenness of insight and power of analysis of the gifted "individual" who "wrote up" that great scandal for the New York *Times*. But we think the Philadelphians beat us entirely in the supply of collateral information and in stern realistic description. The description of "the wounds of the victims" which one Philadelphia journal furnishes has been done by a master hand, and the "History of Great Philadelphia Murders," written doubtless by the same person and appearing in the same paper, sheds a lurid light on the past of the Quaker City. We cordially invite the author not to wait for the occurrence of a grand robbery to furnish us with a history of "the great Philadelphia burglaries."

The special attention of the reader is directed to the Financial Review on another page. Its place among the advertisements is by no means significant of its value, but is resorted to only that we may obtain the latest intelligence of the market.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of THE NATION *should be addressed to the Editor.*

INCLUSION OR EXCLUSION.

If there are any persons who believe that it is possible to devise a plan of reconstruction which shall instantly restore universal loyalty and good feeling at the South, or, to speak more correctly, *create* such feelings where they have never yet existed in the breasts of the majority, we are not among them. We look for no such miraculous change. We do not object to Mr. Johnson's plan on account of its failure to achieve such an immediate success, but because it tends to make a true and just reconstruction more unattainable in the future than it is to-day. We do not complain that it has not reached the goal, but that it moves in an opposite direction.

Now we observe that some earnest and sincere friends of liberty are troubled with apprehensions concerning the restoration of the rebellious States, even upon the basis of universal suffrage. They anticipate an effort, in such case, for the control of colored voters by their employers; and fear that the poverty and the landless condition of the negroes, together with their general ignorance, will make them tools in the hands of unscrupulous men, and that a Southern delegation in Congress, elected by universal suffrage, may not differ materially from that which has been chosen by Mr. Johnson's select constituencies.

We do not think these fears entirely without foundation. In one-third of the Congressional districts at the South the freedmen's vote would have scarcely any practical influence on the result of the election. In another third the whites would combine, and would be able to outvote the freedmen and original Union men for years to come. And in the remaining districts, where the negro vote would, if united, be the controlling element, it will not be difficult for shrewd politicians to divide that vote in some districts, to coax it in some, and to terrify it in others. But it would very soon be impossible to carry an election by bullying the majority, and three or four years of experience in politics will teach the new voters the folly of division among themselves. In a very short period Southern politicians would be compelled to rely upon the same arts for securing the votes of their colored neighbors as those which they use among white men. In the districts where the white population is in the majority, it would not be possible for political aspirants permanently to ignore a heavy negro vote. Nothing but the most absolute unanimity among the white majority, such as has never yet been known, would suffice to prevent candidates from seeking to gain at least a part of the votes of colored men. We regard it, therefore, as inevitable, that in the course of a few years equal suffrage would entirely transform Southern politics.

It is maintained by some to be essential to the security of the nation that all who have been influential in bringing about the rebellion should be for ever deprived of political power. It is urged as indispensable that a number, variously estimated at from five hundred to fifty thousand, must be banished from the country, or deprived of their property, or at the very least deprived of their votes. Without discussing the questions of humanity or generosity involved in such a proposition, we maintain that such a measure is utterly impracticable as to any large number, and entirely useless if extended only to a few. Nothing less than the banishment of fifty thousand men, with their families, numbering altogether nearly three hundred thousand souls, would suffice to break the hold of the present leaders of the South. Such a proposition is as absurd as Mr. Johnson's benevolent suggestion, that four million negroes should fling themselves into the Caribbean Sea, in hope of finding a place where they would be welcome.

We are persuaded, moreover, that the influence of Southern leaders has been exaggerated. It is very generally believed at the North that Southern disloyalty has been created solely by political managers, and has had no root among the people as distinguished from the politicians. This appears to us to be a great mistake. We believe that the politicians have pandered to, and worked upon, the popular prejudice, but not that they created it. Did politicians create the Chinese sentiment of contempt for foreigners? Did politicians create the old English contempt for a Frenchman? Prejudices of this kind are the natural fruit of ignorance. It is inevitable that the inhabitants of a semi-civilized country should despise all the rest of the world, and it is folly to charge the existence of such a feeling upon small politicians, who make use of it as they do of everything else that is mean and bad in human nature.

For many years past, and even up to the present day, purblind theorists have attributed the anti-slavery feeling at the North to the influence of politicians. There are as many to-day who believe that but for Mr. Seward there would have been no Republican party, and no powerful anti-slavery organization, as there are who believe that but for John C. Calhoun there would have been no secession. Yet to all intelligent men at the North how ineffably ludicrous is the idea that the great movement for liberty has been in any degree dependent upon Mr. Seward, Mr. Chase, Mr. Sumner, or any other one man, or set of men. In 1848, John Van Buren seemed the great apostle of the Free-soil party. It was just as common then to assert that the party owed its existence to him and his father, and was dependent upon them for its vitality, as it has been in later years to give the like credit to Mr. Seward and Mr. Chase. Yet, in 1856, all the power of the Van Burens was exerted upon the other side, and the party of liberty was five times as strong without them as it ever had been with them. So, at the present time, Mr. Seward's great influence is exerted to the utmost in favor of Mr. Johnson's policy, and yet signally fails to carry his party with him in a single township of his own State. Mr. Charles O'Conor, who is the only far-sighted advocate of slavery at the North, distinguished himself, in 1860, by perceiving and avowing the fact that it was the conscience of the North which dragged along the politicians, and not the politicians who deceived the popular conscience. His frank acknowledgment of this unquestionable truth was honorable alike to his discernment and his candor. Let us be equally candid, and avow our belief that the prejudice of the South against the North was founded upon natural causes, which its politicians might certainly have helped to remove, but certainly did not create. The best efforts of all the politicians combined could never have preserved respect and affection for a country devoted to liberty and intelligence, in a land where all were ignorant and half were slaves.

If we are correct in the views thus far expressed, it follows that no practicable measure of exclusion would give us a truly loyal white constituency at the South. No matter how severe the tests which might be applied, no matter how sweeping might be the work of banishment and proscription, no matter how few should be allowed to vote, the result of the elections would be substantially the same as if unrestricted liberty had been given to all the rebels in the land. The elections which have just taken place in Tennessee, under the restrictive system, illustrate the working of the scheme. In Davidson County, which in 1861 cast 6,037 votes, the Union candidate for the legislature now receives only 489 votes. In Shelby County, which in 1861 cast 7,137 votes, the Unionist now receives 379 votes. Of course, they were both overwhelmingly defeated. Under what conceivable plan could such minorities be transformed into majorities?

The opposite plan of *inclusion*, by enlarging the constituencies so as to take in all men, gives a security for the future which cannot be shaken, and which will, with every succeeding year, produce better results. It will instantly annihilate every scheme for the enslavement or degradation of any part of the people. It will compel the reconstructed rebels to choose between an immediate insurrection or a final abandonment of all hope of renewing the struggle. It will compel them, if they submit (as they would), to encourage education by all the means in their power. It will extinguish for ever all dreams of repudiating the national debt or of paying Confederate debts. So much would be accomplished by the simple enactment of equal suffrage. Could we not afford to wait for the rest? Even if the colored people should be for a time deceived into voting for their enemies, or if, by combinations against them, their votes should be nullified, it is impossible that such evils s ould be permanent, and no great harm could be

done meanwhile. From the day on which complete justice was established at the South, its interests would be identical with those of the North, and the two sections would daily come into more perfect harmony.

This plan is further recommended by its true republicanism. The idea of a republic founded upon one-twentieth part of its people, and permanently excluding the other nineteen-twentieths from all political privileges, is revolting. As a transitory measure, designed for a few months, while preparing the way for a broader government, such a scheme may be tolerated; but it can never last ten years in any part of this country. Let us be faithful to the principles of our Government; let us adopt a broad policy, and not a narrow one; let us confide in the whole people, taken together, white and black, loyal and disloyal; and we may rest assured that the virus of secession will be as thoroughly lost in the mass of the loyal people, as the deadliest poisons would be if mingled with the waters of the ocean.

CIRCUMSTANCES ALTER CASES.

That circumstances alter cases is no new thing. They always have, and, probably, always will. Everything depends on the point of view. It makes all the difference in the world whether it were my ox that gored your bull, or my bull that gored your ox. The mere fact of being in power or out, on the ministerial benches or the opposition ones, works magical changes in political opinion and conduct. Of these facts in the natural history of politicians we are having abundant illustration and to spare, just now. Stern patriots, who denounced Abraham Lincoln as a tyrant and a usurper for suspending the *habeas corpus*, that intestine treason might be held in check, and seizing traitorous presses that it might not be fomented, and for exerting the dictatorial powers necessarily inherent in the head of the nation, who was at the same time commander-in-chief of the army and navy, in time of civil war, have undergone a change of heart. The scales have fallen from their eyes, and they now see powers which Lincoln never exercised nor claimed, and which have not the excuse of the nation's extremity to palliate them, to be the bulwarks of liberty, which must be defended at all hazards against all comers. It is the difference of the point of view, or, to use the German neologism, of the stand-point. What was crime in Mr. Lincoln is virtue in Mr. Johnson, because of the different purposes, as these authorities conceive, of the two men.

Mr. Lincoln's lot was cast in the time of a civil war which threatened the very existence of the nation, and which would have destroyed it if sharp and prompt remedies had not been applied to mischiefs which would not bide the time of the processes of peaceful government. With no unseemly haste, with all fitting deliberation, he put forth the powers which are reserved in every polity for its own preservation. The times demanded an administration of affairs the very opposite of that which belongs to times of peace; but for the very same end—the preservation of the institutions of freedom, which give security to life and property and personal liberty. To secure the permanent enjoyment of these blessings it was necessary that some of the safeguards which the wisdom of ages has devised for their protection should be suspended for a season. And this as a terror to evil-doers only. The loyal portion of the population not only submitted patiently to this change in their condition, they received it gladly. We were all of us content to be arrested and put into confinement for a time if the Government, under mistake, thought it necessary so to entreat us. That was a risk which every man had to run, and was willing to run, in order that the safety of society might be secured by the confusion of its enemies. We were content to take the chance of trial by military commissions ourselves, should ill-luck so order, that parricides might also thus receive their due reward. Had it not been so, the necessary measures of the President could not have been carried out. The consent of the people was the ultimate sanction of his action.

But the North was not absolutely unanimous on this point. In every city and every village there was to be heard the voice of lamentation and woe over the downfall of our liberties. The freedom of the press was at an end. Arbitrary arrests had destroyed all the safeguards of personal liberty. Martial law was taking the place of trial by jury. The President was a despot who had usurped all the powers of government, and had centred in his own person the executive, judicial, and legislative functions of the state. The vocabulary of abuse was exhausted and a new one imagined in order to express the sense of these lovers of liberty of his enormities. With all the power claimed for the repression of treasonable language, there was never a Chief Magistrate so well abused as was Abraham Lincoln for his assumption of unconstitutional powers. And this was only because of the point of view. These egregious persons, though standing on the Northern side of the line, had such a squint in their political optics that they saw everything from a Southern stand-point. Whatever interfered with the prosperous progress of the rebellion was unconstitutional and vile. The coercion of States at all, the invasion of the sacred soil, the exercise of martial law on either side the line, the freeing of slaves that sought the protection of our troops, the employing of negro troops, and, above all, the proclamation of universal emancipation, were all things monstrous, prodigious, abominable, and unutterable. For these were all measures for the destruction of the element of the oligarchy which had held the control of the nation for long years, and of which these blatant bellowers were the menials and the parasites, watching the countenances of their masters, doing their dirty work, and rewarded by the broken meat of their tables.

But time goes on. This very poisonous breath of treason filled the soul of the assassin with the spirit of murder. The great citizen, the daily beauty of whose life made more ugly all that hated him, fell at the moment of victory. Another and a different man reigns in his stead. In course of time it gradually comes to light that the new President inclines to reinstate the rebels, red-handed from the fight and breathing hatred and revenge against the nation they had failed to destroy, in the fulness of their political rights. His pardons shower down on the rebel region like the early and the latter rain. He claims that no laws should be made touching their political status as long as they are unrepresented in Congress. He vetoes the bill for providing effectual protection for the emancipated blacks until they are able to defend themselves, or the whites are willing to protect them. He attempts to crush another endeavor to include the negroes in a general recognition of the equal civil rights of all men, of all colors, within the United States, an attempt happily defeated by the response of Congress to the emphatic voice of the people. The immense weight of his official influence is thrown into the scale of rebel hopes. He celebrates the birthday of the Father of his Country by a fierce and coarse invective against members of co-ordinate branches of the Government for words and acts said and done in their places, and charges them with designs of treason, and even of assassination. All along this period of presidential development a marvellous change stole over the righteous souls of the former sorrowers for the lost liberties of their country. There is no such thing now as presidential usurpation. It was only when the despotic powers which war creates were used for the destruction of the rebels that they were of the devil. Now that these powers are employed, when the war is over, for the comfort and restoration to power of those rebels, they are the palladium of our liberties newly come down from heaven. And that these wholesome prerogatives may have no let or hindrance in their sway, it is urged seriously upon the President to drive Congress out of doors and set up for himself, with the aid of the elect rebels ready to come up to his help against the mighty!

It is lucky that these political philosophers are thus open-mouthed in magnifying the presidential office, as its incumbent holds the opinion, honestly we will not question, that he is clothed with the absolute power of dictating the terms on which the States lately in rebellion shall be restored to their rights in the national councils. It is well to know how far treason can propose to go, as we have no fear of the President's listening to its frantic outcries. Congress has, thus far, with moderation and dignity, vindicated the rights which the President himself, in his message, and repeatedly since, has declared to inhere in it. It may be trusted to continue unto the end. The people sustained Mr. Lincoln in his necessary exercise of the extraordinary powers given him by the Constitution because they were necessary. We may be sure that they will not sustain Mr. Johnson in the exertion of those powers now that the exigency requiring them is past.

THE FEDERAL JUDICIARY.

A BILL to remodel the judicial system of the Federal courts has passed the Senate of the United States. It proposes changes so great that they ought to be at least thoroughly discussed before being finally adopted.

A description of the present system will be necessary to the understanding of these changes. The system as it now stands was framed by the judiciary act of 1789. Under it the country is divided into districts, in each of which is a district court, which has original jurisdiction of all admiralty cases and of certain other classes of cases. Several districts are then combined into one circuit, and for each of these circuits there is a circuit judge, who holds circuit courts in each district. He hears all appeals from the several district courts, and his court has also original jurisdiction over almost all classes of cases cognizable in the United States courts of which the district courts have not exclusive jurisdiction. Then the circuit judges are all combined to form the Supreme Court, whose jurisdiction is partly appellate, the amount of $2,000 involved being necessary to carry an appeal to it, but which has also jurisdiction of controversies to which a State or a foreign ambassador is a party. Inasmuch as the circuit judges cannot be sitting in the Supreme Court and holding the circuit courts at the same time, the various district judges are also authorized to hold circuit courts in their respective districts in the absence of the circuit judge, or they may sit with him if required, but not to hear appeals from district courts.

This system has been in existence now for some seventy-seven years. The practice under it is quite well settled, and although there are some defects in it, yet it is doubtless true, as we once heard one of our most eminent lawyers say, that in none of the courts of the country can a cause be reached so soon or disposed of so well as in the courts of the United States.

The bill now before Congress proposes to abolish the circuit courts entirely, throwing into the district courts all the business heretofore done in the circuit courts except the appeals from the district courts. It then makes a court of appeals in each circuit, composed of the district judges and the judge of the Supreme Court for that circuit, any three of whom may hold a court. And it makes the decisions of this court of appeals final in all cases unless more than $10,000 is involved, or a construction is to be given to the Constitution, or a treaty, or a revenue law of the United States, or unless the court of appeals shall certify that the question involved is one of general importance.

The first noticeable change which the passage of this bill would bring about is that the judges of the Supreme Court will be thenceforth engaged wholly in the determination of questions of law. Now each of them in his own circuit every year holds terms for jury trials. He meets questions as they come up fresh in controversies. He sees the cases as they develop themselves on the trial. He has the witnesses before him; he sees the jury face to face. He is brought into fresh and living contact with the heart and life of the people, and his own sympathies with the people are inevitably quickened. A judge who is all his life devoted only to the examination of dry legal questions is almost sure in time to become narrow and technical, more careful of rules than of substance, tithing the mint, anise, and cummin of legal controversies rather than zealous for those weightier matters of the law, justice and equity. Moreover, these visitations of the various circuits by the judges of the Supreme Court tend to make the people better acquainted with that great national tribunal, which is one of the most important parts of the Government. They thus come to know more of the workings of that mighty machinery by which the Government of this great nation is carried on, and the relation between it and the people is made more close and living. The homes of the judges now are in the various sections of the country, and their stay at Washington during the session of the Supreme Court is transitory. They come to the performance of their duties there representing the interests and sympathies and desires of the people of the whole land, while if this change should be made they would almost certainly come to live all of them in or near Washington, and living in that atmosphere they would come to be not the great tribunal of the nation, but a tribunal in which the influences which gather round the capital would have constant and undue influence.

It is especially to be borne in mind that under our system the Supreme Court is not merely a means of determining controversies between citizens and about property—it is the arbiter among the States and between the States and the general Government; and for all those weighty questions which spring out of the complexities of our system it is indispensable that the Supreme Court shall be, and shall be understood to be, in sympathy with the whole nation. If its decisions shall come to be, or to be deemed to be, the conclusions of a small knot of gentlemen residing at Washington, knowing and caring nothing about the more distant members of this huge body politic, its influence will be gone, the respect for law which is of prime necessity in a republican government will be weakened, and a new class of dangers will be added to those which already threaten us.

If the measure in question were only to have this effect upon the Supreme Court we should deem its adoption disastrous. But this is not all. Its effect in another direction will be equally dangerous. It will give us in each of the ten circuits into which the country is divided a tribunal which has jurisdiction of great and weighty questions, and from which there is no appeal. Thus, instead of having one national system of jurisprudence, we shall have ten, whose rules and practice may be as diverse as the local interests of the different circuits. For controversies involving less than $10,000 (and by far the greatest number of litigations involve less than that) the court of appeals, composed of the district judges, is the final arbiter. For all questions arising under the laws of the United States other than the revenue laws those judges would have the power of final decision. At any time thus to divide up the jurisprudence of the country into different systems would be injurious, and would tend to increase sectionalism. But especially would this result follow now. We are coming out of times of great upturning, which have left innumerable questions for whose decisions we must look to the courts. But we are not so far out of our troubles as that the fires of sectional feeling will cease to burn. On the contrary, they are sure to burn fiercely for years. And this change in the judicial system comes just in time to expose the courts to the heat of those fires more dangerously than ever; and thus, precisely when the extension of one system over the whole land will tend to heal divisions, and to bind the sections together, it is proposed to set up a new system which shall give greater scope for sectional feeling, and assist divisions and widen separations.

Take, for instance, the cases which are to spring up involving the relations between the different races of the South. Was there ever a time in which the necessity of some great central judicial tribunal to which they shall be submitted was more apparent? And yet at this very time it is proposed to exclude them from the Supreme Court (for they will not involve the revenue laws of the United States), and to leave the determination of them to tribunals exclusively local. To cite one obvious instance: questions under the civil rights bill, except the question of the constitutionality of the act itself, will be by this bill carefully shut out from the Supreme Court.

There are defects of detail in this proposed bill, but of these we do not propose to speak. We only urge against the fundamental idea of the bill these two, as it seems to us, fatal objections. It sectionalizes the jurisprudence of the nation by setting up tribunals of final jurisdiction in each circuit; and it weakens the influence and the power of the central tribunal of the nation.

We have understood that some of the judges of the Supreme Court favor the change. If it be so, we cannot but express our surprise that they should be so short-sighted with reference to the authority and dignity of their own court and to the good of the nation at large.

THE PROGRESS OF RUSSIA IN ASIA.

DURING the last few years the extent of the Russian possessions in Asia has been continually increasing. Large accessions of territory on the river Amoor have brought Russia *vis-à-vis* to Japan, and close to the neighborhood of the capital of China. Extensive conquests and occupations to the east and south of the Sea of Aral have very materially reduced the distance between the confines of Russia and British India.

English and French ambassadors have met with and been foiled by Russian agents at Peking and Yedo; soon English and Russian soldiers may encounter each other on the slopes of the Himalayas. The knowledge of the exact extent of these recent acquisitions has been slow in reaching Europe, but such items of intelligence have been made known from time to time as strongly to excite the feelings of the western nations.

At the close of the sixteenth century the sway of Russia was acknowledged only between the Ural range and the Yenisei River—the area now embraced by the governments of Tobolsk and Tomsk, or nearly 1,200,000 square miles, between the 50th parallel of latitude and the Arctic Ocean. A century later she had appropriated the remainder of Siberia from the Yenisei to the Pacific—a territory, including Kamtchatka, of some 3,500,000 square miles, bounded on the east by the 190th parallel of longitude and on the south by the Yablonoi and Altai Mountains. In the last century, besides overlapping North America, she brought under nominal subjection the Kirghiz country lying south of Tobolsk, and containing perhaps 500,000 square miles. In the twenty years from 1840 to 1858 she pushed her military outposts to the southern boundary of this region, making her line of occupation about coincident with the 45th parallel of latitude, along the river Syr-Daria, a tributary of the Sea of Aral. At the same time, to the east, she acquired the present government of Amoorskaya, washed and accessible at pleasure by the seas of Okhotsk and Japan, and estimated at some 230,000 square miles.

The rich and fertile valley of the Amoor fell into the Russian possession by a mistake of the Chinese commissioners who ratified the treaty of Nertschinsk in 1733, by which it was agreed that the Yablonoi Mountains, in which rise the northern branches of the Amoor, should divide the two empires. The boundary marks were unaccountably placed to the south of this line, on the banks of one of these rivers. A chance discovery of the fact by the Russian Government in 1844–5 induced them to encroach still further on the Chinese territory. During the Crimean war General Muravief, who had been sent to provision the Russian fleet shut up by the allies in the harbor of Petropavlovsk, made a map of the Amoor, and occupied the mouth of it, under pretence of the necessities of war. A town was founded here, and the port strongly fortified, and vessels were fitted out, which, had it not been for the termination of the war, would have been let loose upon English commerce.

At the commencement of the Crimean war Admiral Putiatin, the commander of the Russian squadron in the Pacific, was shipwrecked on the coast of Japan, with which country he had just concluded a treaty. Cut off from his fleet by the allied ships, he was forced to stay in Japan, and for a long time had a camp at Simoda near Yedo. No European nation was then represented there except the Dutch, who were confined to their port of Nagasaki. The admiral, who was a skilful diplomat and had already thoroughly acquainted himself with China and the neighboring islands, busied himself with enlarging the influence of Russia in Japan, and left an impression which has not since been effaced. Escaping finally from the country, he sailed up the Amoor and arrived at St. Petersburg just when the Government most needed his advice, with propositions for establishing and equipping a powerful steam fleet in the East. He was followed presently to St. Petersburg by two Chinese commissions to protest against the invasion of their country. Their language threatened war, and war meant exposure of Russia's aggrandizement on the Amoor; and both might have happened except for the opportune alliance of England, France, and the United States for the forcible protection of their trade with China and for an extension of their commercial privileges. Russia agreed to join in the demonstration, for the general advantage of civilization; and as nobody understood this so well as Admiral Putiatin, he was given the command of a fleet and ordered to proceed by way of Siberia to join in the negotiation of the three other powers.

While they, from explanations and menaces, had come to open war and had occupied Tien-tsin, the admiral, without a fleet, was secretly negotiating through the monks of the Russian mission, the only Europeans residing at Peking. He managed so adroitly that without striking a blow he was the first to sign a treaty, and one that surrendered to Russia the whole territory on the left bank of the Amoor, and all on the right bank from the sea coast to the Usuri, one of its principal affluents. Simultaneously General Muravief with a large army entered into negotiations with Chinese ambassadors on the upper Amoor, and only two weeks later effected the treaty of Aigun, by which Russia obtained other and considerable possessions in this region and the right of navigating all the southern branches of the Amoor. These were both confirmed by another treaty ratified at St. Petersburg, September 10, 1858, and at Peking August 24, 1859. By this treaty the Russians also gained possession of the Chinese part of the island of Saghalien, and were assured the same privileges and commercial advantages that might at any future time be granted to the western barbarians.

When the allies entered Peking they found that the Emperor and all the officials had fled, and they were quite disposed to use the mediation of General Ignatief, who had come out as the successor to Admiral Putiatin. He greatly facilitated the conclusion of a peace between the belligerents, and, of course, reaped his reward by a new treaty, in which China ceded still greater possessions on the Amoor, and recognized as the frontier in Mantchooria the little river Tumen. By this means Russia gained a port open all the winter, and the boundary was transferred in five years from 62° north latitude in the Sea of Okhotsk to 42° north latitude in the Sea of Japan. A city has since been founded in this harbor, destined to be the great commercial centre of that region, and called Vladi-Vostok, *the ruler of the East.* Corea remains to complete the ambition of Russia in this direction. Its possession will enable her to make the Sea of Japan a closed sea at her discretion.

With Japan the Russian policy has been one of great conciliation, totally unlike that of the western powers. Instead of retaliating for injuries, Russia has extenuated them. She has never opposed the Japanese Government, but has always given it good advice in straits, and has encouraged opposition and resistance to the demands of other nations. Ambassadors dealing on these principles would find themselves much embarrassed by the presence of other European agents. Therefore, when Admiral Putiatin went to Japan after the treaty of Tien-tsin, where he was received most cordially as a former guest, he had inserted in the new treaty which he made that the Russian legation should reside at Hakodadi, a small northern port, but able to command the northern entrance of the Japan Sea, and not at Yedo, where were the representatives of other nations. Here the Russian embassy is situated on a mountain in the small island of Matsmai. It is strongly fortified, and contains houses, barracks, hospitals, and a school where young Japanese learn to read and write Russian, and act as unconscious missionaries of Russian influence, gaining as they do all their knowledge of Europe from Russian sources. Connected with this are docks and all the material and conveniences for repairing ships. In fact, Hakodadi is now the chief naval station of Russia in the Pacific. From its situation it can easily be rendered a second Sebastopol. A sufficient index of the powerful influence of Russia in Japan is found in the recent arrival of several Japanese youths in St. Petersburg, to be educated in the Russian military and naval schools.

Meanwhile extensive conquests have been made in Central Asia. We all remember a rectangular-shaped patch on our maps called Independent Tartary, with its three cities of Khiva, Bokhara, and Khokand, and with the Sea of Aral in its centre. Nearly two-thirds of this region are now within the Russian boundaries or subjected to Russian influence. We have already indicated the successive steps by which the empire had advanced to the Sea of Aral and the Syr-Daria or Jaxartes, and held the line by a chain of forts. Not content with this barrier against the Osbegs, it was preparing, in 1863, to invade Khokand, when the Polish war brought matters to a stand-still. The next year, however, the plan was carried out in the capture of Turkestan and Avlietta, by which the Russian frontier was displaced several hundred miles to the south. The Khokandians, worsted in subsequent engagements, fortified Chemkend to the best of their ability and made a stubborn but a futile resistance. The line of 1864, however, was still unsatisfactory to the conquerors. Pretending that in self-defence they had no other resort, they threw themselves still further up the Syr-Daria, close to the city of Khokand, enclosing in their lines the populous and flour-

ishing city of Tashkend, the key of Central Asia, and one of its principal marts. Its possession by Russia will not only develop the resources of the valley of the Syr-Daria, but will greatly stimulate trade, which henceforth will pass through Russia rather than through Turkey or India. Bokhara, another large trading city, is likely to follow the fate of Tashkend, and the Russian occupation to extend to the Oxus. In fact, an army is now acting against Bokhara, ostensibly to obtain the release of Struve, the Russian ambassador. Already there are Russian steamboats on the Sea of Aral which sail up the Oxus to Kungrat in the immediate vicinity of Khiva, and the whole country west of the Aral is Russian territory. From Khokand to Peshawur, in India, is but a thousand miles at most.

Vast as is the region thus held by Russia in Asia, it is her purpose to bind it together by roads and forts so as to present a consolidated front to attacking powers. A railroad is in progress from Moscow to Astrakhan and another projected from Moscow to Orenburg, and thence to the Sea of Aral. The immense advantages of such a position in case of a war with England are evident at a glance. With a telegraph connecting St. Petersburg with the Pacific fleet, and another, already partly completed, to Tashkend, British colonies and British commerce the world over would be exposed to sudden and perilous assaults before reinforcements or scarcely information could arrive from the mother country. Such a deplorable contingency we are sure the United States has not the heart to invoke, but it has of all countries the least to fear from the aggrandizement of its mighty neighbor, and is absolutely free from the jealousy of competition; which cannot be said of our cousins across the water.

QUARE TRISTIS?

Why shun, my soul, with downcast, cowed behavior
The strife that lowers?
Man's lot is pain; shall Satan or the Saviour
Attend on ours?

Still in the van is found thy conquering Warden;
And flight is loss.
The soothing angels of the grievous garden
Still haunt his cross;

And if, accomplished all thy craven fears,
That cross be mine,
On high the martyrs sing, Faith grows in tears
As pearls in brine.

If 't were not for the world, that comes between
With cares unmeet,
O, child of God, by thee the stars were seen
Beneath thy feet!

Thou, Father, fallest into no mistake.
We judge amiss,
And often choose the sordid things that make
Ignoble bliss.

Then bless us—but for this, with bended knee,
On Thee I call—
As we should pray that Thou shouldst bless if we,
Like Thee, knew all.

E. Foxton.

IMPORTANT UNPUBLISHED TESTIMONY AS TO THE CONDITION OF THE SOUTH.

The following report of the examination of a distinguished Southern general before Mr. Johnson and one or two members of Congress, at the White House, has not, for obvious reasons, as yet found its way into print. It has been furnished to us by a gentleman in whom we have the utmost confidence, but whose name we, of course, cannot reveal.

When General A——z had been examined before the Committee of Fifteen, the President sent him a note to say that he would be glad to see him in the evening to meet a few Congressmen. In the evening he came, and the following conversation ensued:

Q. By Mr. Howard: What is your name? A. Major-General A——z, late f the army of the Confederate States of America.

Q. What is your occupation now? A. Well, sir, I have n't had much time to do anything since the war ended; I have been looking after my family; my children were taken with the measles shortly after the fall of Richmond.

Q. By Mr. Doolittle: So your children have been having the measles, have they? A. Yes, sir.

Q. Has there been much measles in the South since the close of the war? A. A great deal.

Q. More than usual? A. Yes, sir.

(Mr. Doolittle makes a note on the destitution of the South.)

Q. By Mr. Stevens: Well, general, you need not answer, if you do n't think it 's a fair question; but have you got the measles yourself? A. I do n't think so; but I have n't much experience in such matters, and I may be mistaken.

Q. How are you living now? A. Well, it costs a good deal to live, now that prices are so high; I pay five dollars a day.

Q. By Mr. Doolittle: "Five dollars a day?" A. Yes, sir. (Mr. Doolittle takes another note of the destitution of the South.)

Q. I suppose that includes rent? A. Yes, but only for one room; every one who lives in the same house with me has to pay the same.

Q. Are you very crowded? A. No, there is quite room enough.

Q. How many of you live together in this way? A. Several hundred.

Q. Why, you must be living in a hotel? A. Yes, I always find it most convenient to do so when I come to a city for a few days.

Q. What are you speaking of? A. Willard's Hotel; I have been staying there for a few days.

Q. Oh, pshaw! That 's not what I mean. How are you living in the South? A. Oh, I must have misunderstood your question. As well as could be expected.

Q. Where is your home? A. Albany, Georgia.

Q. What is the state of feeling among the inhabitants of Albany with reference to the United States? A. Well, sir, I have not had much opportunity to observe the feelings of the people, as the measles in my family have kept me very much at home.

Q. What is the general feeling throughout the State about the result of the war? A. I think I may say, without hesitation, that the people generally seem to feel as if they have been whipped; but I do n't wish to express an opinion definitely on this subject, as I do n't take any newspapers.

Q. You do n't see any newspapers? A. No; I have felt it my duty to keep aloof as much as possible from politics since the close of the war, and have felt that it was the duty of the Southern people to attend to their private affairs and not interfere any more than was absolutely necessary with public matters. But I 'm only an old man, sir; you must not attach too much importance to what I say.

Q. What is the feeling with regard to the negroes, as far as you know it? A. The feeling to them is, as it always has been, very kind. Their old masters feel sure that they cannot do so well free as when under proper restraint, and, on that account, feel a kind of pity for them, which increases their kindness.

Q. You do not know of any ill-treatment to negroes since the war ended? A. Not at all. It has been found necessary in some cases to administer a little correction, because they were found to ask exorbitant wages; but there has been no cruelty whatever.

Q. Do you mean that they have been whipped? A. I do not know about that. I said before that I had thought it better to keep very much at home. I merely heard once or twice that a little correction had been administered; I do n't think I enquired what kind had been given. But I 'm only an old man, sir; you must not attach too much importance to what I say.

Q. What is the feeling to Northern men in the South, as far as you know? A. I do not feel qualified to speak distinctly on that point. In fact, I have only known of one Northern man passing through our town during the past year.

Q. And how was he received? A. Well, he was a correspondent of a Boston paper, I believe, and the inhabitants assisted him in his journey through the South as soon as they knew his circumstances. (Mr. Doolittle takes another note of the hospitality of the South.)

Q. How do you mean "assisted him?" A. I do n't know, sir, exactly; I did n't see him myself; I tell the story as I heard it from one of my acquaintances.

Q. How do you think a Northerner would be treated who openly advocated qualified negro suffrage on an impartial basis in Albany? A. Do you mean how he would be treated by the negroes? Q. No, sir, by the whites?

A. Well, sir, I have never thought of that question before, and I should want more information before I could answer it. Strangers are generally treated very hospitably in the South.

Q. Do you think that a negro could have a fair trial by a Southern jury now? A. Why, I suppose so, sir; juries are generally fair, I believe; I do not see why they should not be. They have been accustomed to trying negroes for a great many years. I think I may say that a Southern jury would understand better than any other men could the peculiarities of the negro character, and would probably, on that account, give him a fairer trial.

Q. What, in your opinion, is the capacity of the negro for education? A. According to my experience they have a considerable desire to learn; but, gentlemen, the fact is, that you can do nothing with the negro unless you thr——

Q. What, sir? A. Unless you educate him, sir.

Q. I suppose the white population of the South is hard at work? A. Oh, yes; every one is hard at work.

Q. Well, what are they doing mostly in Albany? A. Well, I think they are mostly assisting each other along.

Q. Do you know of any secret organizations at the South to break up the Union? A. No; I have not heard of any.

Q. Suppose that the Southern States could now secede from the general Government, would they do it? A. Well, I hardly know how to answer that question. I do not think that their opinion on the right of secession is changed very much, though it may be. But I 'm only an old man, sir; ou must not attach too much importance to what I say.

Q. Perhaps my question was not plain. In the event of a foreign war, and the invasion of the United States by a foreign power, would the Southerners take sides with the invaders or with the United States? A. Well, now, sir, you must really allow that 's hardly an easy question to answer. I think I may say that the course of the South would, under such circumstances, depend somewhat on circumstances. For instance, if Portugal was to invade the United States, I think it hardly likely that there would be a civil war; but, then, if England and France were to come, it would be hard to say what would be the result. I do n't know. I do n't really think I can answer your question distinctly.

Q. Well, in such a case, what would your own course be? A. I think that circumstances might make a decision very difficult. I have generally found a decision very difficult. But in such an event I should like, if possible, to remain neutral.

Q. What is your own opinion on the constitutional question of secession? A. I do n't think any of the Southern States have seceded. I think they are still in the Union.

Q. What I want to know is, what you think about their constitutional right to secede?

President Johnson.—You need n't answer that question if you do n't want to, general. Such a question as that should not be put.

A. Oh, I have no sort of objection to answering it. I have n't seen the Constitution for some years, and, as I understand it has been amended a good deal lately, I do n't feel that I can have an opinion on that subject.

Q. Did you take an oath to support the Confederate States while in their service? A. Well, I do n't exactly know, sir. I have taken a good many oaths during the past few years, and I do n't remember whether I took any on entering the Confederate service. I suppose I did take such an oath if anybody asked me to; but then I rather think it must be neutralized by two or three I have taken lately to support the United States. But I 'm only an old man, sir; you must not attach too much importance to what I say.

Q. What, in your opinion, has been the effect of the Freedmen's Bureau at the South? A. My feelings are too strong, sir, to sp-eak on tha-t sub-ject. Oh, Mr. Johnson—(the general's emotions here became so strong that the subject was dropped and coffee served).

SERVANTS FOR HIRE AND SERVANTS FROM DUTY.

In a country where poverty is oftener the result of imprudence than of misfortune, and where it is more difficult to keep wealth than to amass it, any attempt to inflame the poor against the rich must be set down to unworthy motives. There are, indeed, very excellent men among us who believe that property, when it has exceeded a certain limit of accumulation —a limit, by the way, which it is no easy matter to determine, even for the reformers themselves—becomes robbery; and who are accordingly in favor of sumptuary laws to prevent this excess. There are also individual instances not a few of men who, having moderate and of course definite notions of a proper competence, give over increasing their estate beyond the successful attainment of it, and perhaps are apt to think not harshly but compassionately of others whose notions are a little more extended than their own. There is a very just public disesteem of those with whom money-getting is an end rather than a means, and no exception can be taken to an earnest protest against mammon-worship. It is impossible that, with the examples of our Coopers, Bateses, Cornells, and Peabodys, comparisons should not be made that will be odious to less munificent millionaires. There exists, moreover, an altogether natural jealousy of the growth of a plutocracy which shall be able to elude or overawe the laws, and secure for itself substantially the privileges and immunities of an aristocracy of birth. Certainly it is not more equitable than democratic to demand that Ketchums in broadcloth and Ketchums in rags should receive and expiate the same sentence without favor or prejudice. These are not the appeals which we would expose as base and dangerous.

Within the past three weeks a representative whose seat was contested in Congress accused his competitor of owing his advantage to his wealth, and the House of oppressing the "poor but honest" choice of an equally poor but honest fragment of the sovereign people. Almost in the same hour an aspirant to senatorial honors was engaged in fastening odium on a rival (but not self-nominating) candidate because, forsooth, the latter was a gentleman of independent means, doubtless partly acquired during the war, possibly, as charged, by Government contracts, and therefore presumably through fraud, while he, the virtuous opponent, had an empty pocket which was a charm against the temptations of the world, the flesh, and the devil, and—what must be supposed relevant and to the purpose—had never betrayed the people and never would. In each case it was sought to be shown that the people, who are also called "the masses" and "the honest masses," were the victims, actual or contemplated, of a conspiracy of wealth impertinently pretending to represent their interests. Happily, the demagogism of these disappointed politicians was too transparent to be pernicious. It was notorious that the outraged constituency in the first instance had, in the most atrocious riot in the history of the nation, resolved itself into a band of thieves; and that the ousted member, having at first opposed the $300 exemption clause of the bill which regulated the draft of 1863 as a discrimination in favor of the prosperous, afterwards denounced its repeal as a discrimination against the poor. It was more than suspected in the second instance that the pocket so ostentatiously turned inside out for the public inspection, had a lining in preparation by an eminent professor of the sartorial art.

But the question may merit consideration that does not belong to the persons who have proposed it: Is the safety of our institutions imperilled by the office-seeking and office-holding of affluent men? Is our legislation likely to suffer in impartiality, purity, practical efficiency, or political soundness because of the great possessions of certain lawgivers?

Nothing is more certain, by our republican reasoning, than that the equality which we assert precludes us as much from disparaging a fellow-citizen for his superabundance as for his lack of this world's goods. In comparing candidates for a district or a State, there is no presumption one way or the other to be drawn from their pecuniary condition merely. As well insist that because Boston is rich enough to buy up the whole State of South Carolina, its representatives are better or less qualified than hers to direct national affairs for the good of the nation. Go one step further: enquire the history of this one's ease and that one's neediness. You have now, perhaps, a valuable test of character, which may or may not contradict your *à priori* conclusions. For there is such a thing as dishonorable poverty as really as ill-gotten gains. The destitution of the South, in contrast with the fatness of the free North, for example, has been a crime and in no sense an accident. So it may well happen that a Congressman's best warrant for the place he occupies consists in the fact that his income surpasses the aggregate of the salary of his compeers. The capitalist may be as good a republican as the workman, and a better political economist. Great professional success, accompanied by its profits, will anything but discredit the lawyer's exposition of constitutional law or incapacitate him for framing a bill. In short, wealth, acquired or inherited, is not incompatible with eloquence, loyalty, energy, wide experience, administrative capacity, along with the most thorough sympathy with the feelings and aims of the people.

What we have, in fact, to deplore is not the alarming number of rich politicians in quest of office, but the too great number of respectable, well-to-do men who studiously avoid all share in the conduct of the government. This is due to two great causes—the first, a neglect to exercise the right of suffrage scrupulously and on every possible occasion, or to recognize the obligation which it owns in common with every other right. Hence, especially in large cities, those long periods of misrule culminating in a crisis, when official knavery and delinquency must be voted down and out,

or the municipal life becomes intolerable. The men of standing and property, without regard to party, rally to the polls and help to fill the trusts which have been so abominably abused. But the spasm is soon over. At the next election the same class rally more feebly; the reluctant incumbents decline a second term of office; and the reins slip quietly back into the hands of those whose idea of public service is like Mayor Gunther's definition of patriotism—enlightened self-interest.

The second chief cause of indifference to politics on the part of moneyed men is the absence of any inducement, apart from an ambition for distinction, to accept office even when freely tendered. It would be a positive sacrifice to interrupt their business for a salary which would hardly pay their butcher's bill; and it is small blame to them if they generally decline to entertain the proposition. Commissioner Whiting abandoned a highly lucrative practice to assist the Government with legal advice, and returned his entire salary to the Treasury. President Schultz, of the Metropolitan Board of Health, relinquishes an income many times as large as his salary. Here and there one sees similar instances of high devotion, just as during the war all degrees of fortune stood shoulder to shoulder in the ranks. To censure those who decline to do likewise is certainly preposterous. Yet the spirit which induces this sort of political self-immolation deserves to be imitated as it is almost beyond praise. Because it is not more prevalent; because the salaries of office are so inadequate and untempting; and because office is to a greater or less extent a means of enriching the occupant—our legislatures are entered by veritable *chevaliers d'industrie*, or by venal politicians, whose only care is to vote according to their pledges on those public issues which divide parties and determine elections. The quarrels of corporations, the competition of private schemes, the thousand and one intrigues of a corrupt lobby, do not come before the people, and in the nature of things can neither be watched nor understood by them. They do not know how often a legitimate enterprise has to purchase a legal sanction for itself; how often an unsuspecting interest finds itself attacked by some filibuster in or out of the legislature, who expects to be bought off. They do not know with what comfortable consciences men can in this way bribe their enemies and outbribe their rivals, who would scorn to tell a lie or to pick a purse. We do not say that the simple remedy for this disease (whose symptoms are truly formidable) is to send none but rich men to the legislature; but we submit that they would if there be likely to head the list of the incorruptibles.

THE SOUTH AS IT IS.

FROM OUR SPECIAL CORRESPONDENT.

XXXVI.

BOSTON, April 11, 1866.

I WAS not able, in the space afforded my last letter, to complete the résumé of my observations in the South. I undertook then to describe the feelings of the white population there; to-day I wish to speak of the blacks.

The present condition of the negroes in the States which I have been visiting, if it be compared with their condition during the summer and fall of last year, will be pronounced prosperous. Though it is often denied, there must have been a great deal of anger and dislike in the feeling with which the Southern people regarded the newly emancipated slaves. The newspapers did now and then print an editorial article recommending a kind and generous treatment of the freedmen, and praising them for a faithful adherence to their masters through all the war. This I learned to look upon as being very often only an indirect expression of the Southern theory that the system of slavery was not hated by the race subject to it. For constantly, in almost every issue of almost all the newspapers, sometimes even in the columns of advertisements, were many contemptuous and injurious flings at the negroes, and the talk of the people among themselves showed that their opinions were better reflected in the correspondence and local paragraphs than in these occasional editorials. They were very ready to hear and repeat any story that made against the freedmen. The ignorance, the viciousness, the insolence of negroes, were insisted on. It was always assumed that the unknown perpetrator of any crime must be a negro; and in every way the observer was made to feel that in the South, however great in old times may have been the love for the slave, there was not much love for the freedman. He was led also to reflect that if the saying is a true one that man cannot be just to his neighbor unless he loves him, the future of the colored population, so far as the Southern whites should have power over it, would be anything but bright.

The negroes themselves were at that time furnishing people who were inconsiderate or prejudiced with an excuse for declaring that emancipation had ruined them as laborers. Impelled by various motives, many were wandering about without regular occupation or fixed abode. I met men plodding along Virginia and North Carolina roads who had come from distant parts of those States, or from distant States, seeking work or looking for relatives. One man I remember who had walked from Georgia in the hope of finding at Salisbury a wife from whom he had been separated years before by sale. In Louisiana, I met men and women who since the war had made long journeys in order to see their parents or children. I dare say there must have been thousands of such cases. Traversing the South Carolina roads in December, it was common to see parties of hungry, ill-clad negroes moving towards the coast country, whence, during the war, thousands had been removed for safety's sake, when it was feared that the lower districts would be invaded. They wanted to get back to the region with which they were familiar, or they thought to find employment in labor which they understood better than that which they were leaving, or they were set adrift by their employers, or it might easily be that no place could well be worse than the region in which they found themselves when the war closed. These were sights that seemed to fill every white Southerner with anger. A public officer of the State said to me, as we rode together in a stage, "See those d—d niggers! They think of nothing but crowding into Columbia. What do they want there?" Next day, in the office of the Freedmen's Bureau, I found an answer to his question. I saw there one of the men whom we had passed upon the road, and whose laziness had been bitterly condemned. He was old, half naked, foot-sore, and hungry. They had given him some army biscuits and promised him transportation by rail towards Georgetown District. "He could get work on a rice plantation there," he said, "and rice was his work; he did n't know cotton very well. He had been discharged by the man who hired him that year and had received no wages for all his work, except some bushels of corn, which he and his family had brought away on their backs. He had lived in the up-country three years, ever since his master moved him, but had been born and raised in the Pedee rice country." Of such cases as this too there must have been many thousands. I saw them occurring in all the months between August and January.

Undeniably the negroes were at that time somewhat ignorant of the right use to be made of their freedom, though the extent of this ignorance has, in my opinion, been much exaggerated. At no time, I think, has anything like a majority of the negroes thought that freedom meant exemption from labor. I have never met one who seemed to think so, and certainly at no time has the behavior of a majority of them shown that they entertained such a notion. Yet many of them were idle for weeks together, and were too apt to be lazy and refractory, to violate the contracts which they had made, and to set too high a value on their services as laborers. I remember talking with an old negress in Louisiana, who spoke contemptuously of the stupidity of the negroes living on the great plantations; they knew "nothing but just crop," she said; they stared at every little thing; it made her laugh. She accounted for their ignorance by saying that they were never allowed to go anywhere except on to the levee in front of the overseer's house, and so never saw anything. That such a people, and almost all were such to some degree, should have taken advantage of their new liberty to go away from the plantation and see what the world outside was like, is not strange. Moreover, on many plantations their freedom was only a name, a rumor. In many cases to leave the plantation of their birth was to leave a tyrannical master. In the towns they could see the Northern troops, and talk with the agents of the Freedmen's Bureau. So for months the negroes were restless, and got the ill word of every one incapable of making allowances for their peculiar position.

It is to be remembered, too, that most of the farmers and planters were cultivating but little land in 1865, and confined their attention to the raising of breadstuffs, so that many laborers were necessarily idle. In the summer and early autumn of that year, then, the popular Southern opinion of the negro was, very probably, lower than it had ever been before, and the negroes, without the aid of the Freedmen's Bureau, would have been more nearly defenceless before their enemies than at any previous time. The almost universal judgment was that laziness and improvidence were inherent in the negro nature, and that in much less than a century the negroes as a people would be extinct. The more hopeful saw in emancipation a great blessing to the South; white laborers would come in, and the black race would perish. The despondent thought that their country was utterly ruined by emancipation, the long heats of the Southern climate precluded the employment of white laborers, and the black race in a state of freedom was sure to perish. I may remark, in passing, that most Southerners who were much interested in the question seemed rather to look upon the

expected immigration of white men as a means of supplying Southern land-holders with a laborious and obedient peasantry than as the incoming of a class of men who soon would cease to be hireling laborers and become land-holders themselves.

Before January was gone the condition of the negroes began to improve. The operations of the Freedmen's Bureau, of which the influence was felt in almost every county, had at least familiarized the minds of the negroes and their former masters with the fact, not learned at once, that the slaves had been really emancipated. Numberless instances of wrongs redressed, of misconceptions cleared away by reiterated instructions, had taught both classes of persons much that both needed to learn, for it is true that the master has been found as much in need of enlightenment and advice as the freedman and more in need of close watching. Not infrequently, too, the master has needed assistance and protection, and I have never, I believe, known assistance to be withheld. I think the Bureau to have been of the greatest value to the South. Not that I have not met with officers belonging to it who were unfit for their positions. Some that I have seen were unfit to hold any office which would require judgment or character in him who administered it. But most of these officials whom I saw were laborious and tolerably competent public servants, and even in the rare instances where I found them disgracefully unqualified to discharge the duties of the post, it was impossible for me to deny that, on the whole, it was better that even they should be there than that no one should be there. Both the white and black population of the South are, in my opinion, incalculably better off than if the Bureau had not assisted in the passage from the old system to the new. Even some Southern men admit this to be true; but, of course, to the mass of the white people the Bureau is odious.

As the public mind became accustomed to the new order of things and was able to look forward instead of around, the planting community found itself in better courage than the planters themselves six months before would have thought possible. The change came over them about New Year. It often encouraged me, after the hopeless and truculent talk that I had been hearing about the worthlessness of the niggers, and the speedy extermination of the niggers, to observe that the actions of the speakers belied their words. For example, a man would say in the hotel parlor that no free nigger could be made to work, that the country was ruined, that the extinction of the whole race of niggers was a certainty and very desirable, and an hour afterwards I would perhaps learn from him that he was getting a vast farm under cultivation, that he was expecting to earn his living and probably make a fortune from the paid labor of some sixty or seventy freedmen, and that his intentions, so far as I could judge, were to treat his laborers with reasonable kindness.

This practical and humaner view of the matter was much more the general view in those States where I was travelling after January than it had been during the summer in the more northerly States. I ascribed it mainly to the fact that the negroes held in their hands, if no other power, the one power of freely selling their labor in open market. No doubt the existence of the Bureau and the consequent absence of State legislation in reference to this question had much to do with keeping the market an open one. Judging from what I saw in Georgia, Alabama, Mississippi, and Louisiana, I should say that a great majority of the freedmen are now receiving tolerably good treatment and tolerably good wages. To pronounce whether or not their wages are good enough I am not competent, and when I say that they are well treated, I speak of them merely in their character of men hired to labor. That there is any general desire or even any general willingness on the part of the Southern people to aid the negro in becoming as valuable a member of society as he might become, in educating and otherwise elevating himself, I do not believe. Whether or not the ability which just at the present moment he possesses, to secure for himself fair wages and exemption from bodily hurt, is to be taken as proof of the further ability to extort from his employers a fair chance in life for himself and his children, may well be doubted. It has not always been found the fact in other countries that a laboring class, because its labor is honestly bought and paid for, necessarily obtains all its social and political rights. And no such class in other countries, at least in modern days, has been opposed by prejudices so strong as those against which the negro will have to contend. Indeed, in my opinion, what he has gained already cannot yet be regarded as his permanent and secure possession.

I did not find the freedmen taking much interest in topics of this nature. They are, of course, very deficient in all knowledge of the life outside of their own painfully narrow experience. I speak now of the mass and not of a considerable class of negroes who seemed to me as well informed and as clever as most other men of my acquaintance. The majority are densely ignorant, and comprehend nothing of the meaning of politics. I suppose it may be called a deficiency of knowledge merely. Certainly I did not come away from the South believing that there was any body of men there unfitted by nature for exercising any rights that are exercised by American citizens. During the war the negroes, of course, sided with the North. They believed that if the North should be successful they would be freed. And to-day, so far as they can understand the questions which agitate the people, they are of the Union party. But I hesitate to apply the name of loyalty to their feeling towards the Government. They have never had a country.

Leaving out of view the present fitness of the freedmen to exercise the elective franchise, one who sees the condition of the South and perceives the general feeling of hostility to the Government is forced to consider the expediency of proclaiming universal suffrage. There is little doubt in my mind as to the side on which the negro vote would be cast. Years from now, it is possible to conceive, every planter may control the votes of all his negro laborers. But so far as this is a question of expediency at all, it is a question of to-day, and the pressing problems of American politics at the present time are such as touch the negro so nearly that they may be said to be his own personal, concerns. As regards these matters he would not remain in ignorance as to what men were his friends, and what men were not. The class-leader and preacher, the intelligent house-servant, the black men who are able to read, would save the voter from the deceptions of his employer. In the minds of the negroes there is always a secret distrust of the white man, and especially of the Southern white man. The coercive power of the employer, the coercive power of bitter prejudice among the great mass of Southern white men, would be obstacles more formidable. I think that the negroes unprotected by the military authority of the general Government would hardly be able to cast votes enough to alter the elections of any one Southern county. Yet I found some men, Northerners mostly, and negroes, who seemed to believe that the competition of parties would soon produce a favorable change in this regard, and they took a more hopeful view of the matter than I was able to take. I found the Union men nearly or quite as unwilling to see negroes voting as the secessionists are. All parties, I think, would agree that the first step must be taken by the general Government, or the desired end is many years distant.

I say nothing of the more general aspect of the grant of the franchise as a means of gradually elevating the freedman by giving him a power which might be as efficient to elevate him in other respects as the new power of selling his labor has been efficient in improving his condition as a laborer. As a means of aiding the loyal people to retain what has been won by war, it would, in my opinion, be powerful at the present time only when joined with the other means of doing the same thing—the military occupation of the South until she gives guaranties which cannot be revoked.

The work of teaching the freedmen, which is now going on, will not greatly affect the adult negroes. No great number of them, I should say, are under instruction. I found that the children, wherever it was possible for them to reach a school, were docile pupils, regular in their attendance, more laborious in application and more rapid in their progress than white children accustomed to the regular routine of school life. I think the parents are anxious to have their children taught, and may be expected to make sacrifices for the sake of educating them. It is not in their power to do much. It will be interesting to watch the course of affairs in Louisiana during the current year, where, since February, the colored people have been required to support their own schools. They believe that learning is to raise them to an equality with the white race, and are, therefore, eager for schools. I do not know why this feeling should not be of permanent operation.

I see that encouraging accounts of the industry of the freedmen are coming in from all parts of the South. My experience in the South, both as a traveller and as a resident and an employer of negroes, was such that I needed no reports of this sort to convince me that a negro fairly paid and otherwise justly dealt with, living under the same restraints of law which are found necessary for white men, is a satisfactory laborer.

ENGLAND.

LONDON, March 31, 1866.

SINCE I wrote last the reform bill discussion has entered on a new and somewhat more exciting stage. Gradually the Government has perceived, what any man with a clear head could have told them from the first, that the idea of passing a reform bill without agitation was as absurd as that of turning a windmill without wind. Up to the end of last week the chances of the bill passing seemed to be growing daily less and less; as each day went by without any indication of popular feeling on the subject of reform, member after member on the ministerial side began to feel the way for a secession to the opposition ranks. Then Mr. Gladstone, jealous as he is of

all antagonism, resolved to show his supporters he was not disposed to be trifled with. On the last night of the session he taught the House of Commons that, however languid in his advocacy he may have been at first, he was now in earnest about reform. Turning round upon the opponents who badgered him, he taunted them with their horror of admitting the working-men to the franchise, as if they were alien enemies, instead of being "our fellow-subjects, our fellow-Christians, our own flesh and blood." In fact, he adroitly transferred the issue before Parliament from the narrow one of whether the particular bill was good or not, to the broad and general one whether the working-classes were entitled to their due share of electoral power. On this issue he knew—and the House of Commons knew—he would have the Liberal party with him; and forthwith a number of the parliamentary malcontents resolved to defer any idea of deserting their cause till they knew how far the appeal would be responded to out of doors. The Government, as a witty critic said, has at last found a cry, the "citizen against the aristocrat." It is not a bad cry to go to the country with. The *mot d'ordre* has been sent down to the constituencies to get up demonstrations in favor of reform; next week Mr. Gladstone himself goes down to Lancashire to address meetings in the chief towns; Mr. Bright has thrown off the uncongenial moderation which has characterized his late utterances, and has written a letter to the Birmingham reformers in the true old Cobbett style, denouncing the "dirty conspiracy" of the Tories and Whigs, and expressing his conviction that the bill could be carried at once if its enactment were demanded by such a London mob as that which gathered together two years ago to welcome Garibaldi to England.

The fate of the bill and of the Government depends upon the response to this appeal. So far, the result has hardly corresponded to the hopes of its authors. In several of the larger towns meetings have been held in favor of reform; in many more they are announced as about to be held. But, as yet, the whole agitation has an artificial air. It takes a long time to raise public feeling in England. Next week we have our Easter holidays, when half the working-classes are more or less intoxicated; and the week after, Parliament meets again, and the struggle recommences. I do n't know whether the term is a common one in American political jargon, but I remember once seeing a politician described in your country as "being on the fence." Now, at this moment the Whigs are "on the fence;" and whether they step over into the field of reform or throw their feet into the field of opposition, depends entirely upon the amount of outside pressure exercised upon them. The common gossip of the clubs is that the bill will be allowed to pass the second reading by a very narrow majority, and will then be so mutilated and delayed in committee as to lose its claim to existence; in other words, as the author of "Eothen" is reported to have said, "it will be smothered instead of being strangled." But, then, I should add, I have invariably found the prognostications of the London clubs to be at fault about any question into which popular feeling enters as an ingredient.

Moreover, I cannot see that the liberal reformers are even yet prepared to state openly what they hope to effect by a more democratic Parliament. There are numbers of reforms, social, perhaps, rather than political, which an assembly elected in large measure by the working-classes would certainly effect; but to propose them, or even to suggest them, would be so unpopular amongst the governing classes that the advanced Liberals themselves are afraid to do so. For instance, anybody acquainted with rural life in England would admit, if he were honest and unprejudiced, that the system of administering justice by unpaid magistrates belonging exclusively to the land-owning class, is a very real and serious grievance. Of course, like all bad systems, it has something to recommend it. The exercise of their magisterial duties is one of the many inducements to English gentlemen to live upon their estates; and it is a popular theory in our ruling class that the whole frame-work of British society depends upon the residence of the "squire" on his estates. Moreover, the system, like other radically false ones, does not work *quite* as badly in practice as you would suppose it did in theory. The "gentlemen" are certainly more lenient to the laborers, when brought before the bench, than the farmers would be themselves. But this is about all that can be reasonably said: as between laborer and laborer, the country magistrates administer justice with substantial fairness, if without much regard to law. But in cases where class feeling is involved, a laborer meets with scant justice from a magisterial tribunal. A case which has lately excited some interest in England, seems to me to convey a juster impression of what our country life really is than a volume of dissertations. The vicar of a little village, Inkberrow, near Birmingham, is also a magistrate of the peace and the chairman of the petty sessions at the neighboring market town. The clergyman in question is, I believe, very active in his parish, and very zealous if not very wise. Two or three Sundays ago the children of the village school began playing during the service at the game of pitch half-penny. I should tell you that in an English parish, where the clergyman is at all active, any laborer who wants to stand well with the "gentle-folks" must punctually send his children to the Sunday-school; whence they are marched twice a day to church, to sit on benches where their feet cannot touch the ground and where they are frozen in winter and baked in summer. This, however, is a parenthesis. To resume: The wicked little Inkberrow school-girls not only tossed up half-pence in church, but they quarrelled about the payment of their losses. One child had lost a penny, and after some wrangling it was restored to her by another juvenile delinquent, who discovered she had a penny too much. Somehow the scandal came to the ears of the vicar, and he resolved that a dire example must be made. To the clerical mind irreverence in church is the worst of sins; I can recollect, when I was at school years ago, certain ill-conditioned boys kicked a hassock out of church as we were leaving the sacred edifice. I can remember that our master, who was a clergyman, gravely informed us that to the sin of disobedience we had added the crime of sacrilege. A similar opinion was probably entertained by Mr. Gray, vicar of Inkberrow. The chief offender in the squabble was a little girl called Aunty Ballard, eleven years of age, who had returned the penny the other child had lost. Her family were not, in Mr. Gray's opinion, well-conducted people; and she herself had had complaints made against her by her school-fellows. If her ears had been soundly boxed, no more would have been said about the matter. But Mr. Gray had resolved that the terrors of the law must be employed to convert the infant criminal from her wicked ways. So, on the following morning the village constable presented himself, by the vicar's orders, at the cottage of the Ballards, and walked the child off a distance of some miles, crying all the way, and consigned her to the lock-up on a charge of having stolen a penny in church. The keeper of the lock-up took her out of the cell because she cried so bitterly and gave her into the custody of his wife. The parents applied to get the child out on bail, but the vicar-magistrate refused to listen to any such proposition as calculated to injure the effect of his moral lesson. So this unhappy little child was kept in confinement till the following Friday, when the petty sessions met under the chairmanship of her persecutor. When the case was called on, the vicar announced that his object was attained. He admitted with a delightful candor that he knew he had no evidence to support the charge, that he never intended to press it, that he had caused the child to be arrested without a warrant or any formal deposition whatever, and that his only object had been to punish her for her general misconduct. In ninety-nine cases out of a hundred nothing more would have been heard of the matter. The parents of the child would have been told from the bench they ought to be grateful to the vicar for his kindness, and that they had better chastise the offender themselves; but, happily, some Birmingham people happened to hear of the case, and so public attention was called to it. The result will probably be the dismissal of Mr. Gray from the bench of magistrates, but beyond that nothing will be done. A child is always an object of sympathy; but of the country gentlemen who condemn Mr. Gray most strongly not one in a hundred will perceive that the general principle on which he acted was one indefensible in itself. To assert that the laboring class has a right not only to kind treatment but to perfect equality and independence, is still counted a heresy in our agricultural districts.

The other day a certain number of Kent laborers met together and founded a sort of trades union, pledging themselves not to work for farmers below a certain rate. If the union should prosper, a fact about which it is too early to express any opinion, this meeting would be the commencement of a social revolution. Practically, farm laborers are still to a considerable extent *adscripti glebæ*. Some few years ago I had an interest in certain mining works started in one of the home counties. The company which proposed to work the mine paid fair though not extravagant wages—about fourteen shillings a week. This was above the average rate of wages paid in the district; and forthwith the farmers assembled, and agreed not to re-employ any men who left their service to work for the company. The consequence was that they had to import laborers from a distance, and, as the enterprise failed, the neighborhood derived no benefit from the competition. The truth is, nobody can really understand England till they learn to what an extent the feudal system still exists in our counties. The majority of our Liberals are born and bred in the towns and the manufacturing districts, and know very little personally of English country life. It was my fortune to be born and brought up in one of the most agricultural of our counties, and therefore I think I know more about the real strength and weakness of England than many persons who would be looked upon as far higher authorities. One reminiscence of country life let me tell you here. In our

village there was a gentleman who had made his fortune in trade, who was not a man of much refinement or high culture, but who hunted with the hounds, and held his own in country societies. Like most self-made men, he was somewhat touchy about the respect paid him, and he noticed with surprise that his laborers when they passed him on the road never touched their hats to him. He remonstrated with them, and was told the reason was, that though he was a good master he was not a "gentleman born." He threatened to dismiss them, but the threat had no effect. They were very sorry, they said, to leave him; but touch their hats they would not for love or money. And so long as the passion of any Englishman is to become a landed proprietor, and so long as any instinct of country life is aristocratic in its tendency, I do not believe in this country becoming really democratic in its institutions.

PARIS GOSSIP.

PARIS, March 23.

DUELLING seems once more to be the order of the day. M. Brame, a deputy and a member of the *tiers-parti* in the Corps Législatif, in the course of a speech delivered lately in the chamber, cast some very severe reflections on the Paris press, which he described as the most venal press in Europe. A gentleman connected with the press sent him yesterday a challenge, and negotiations are still going on at the time of my writing. M. Paul de Cassagnac, son of M. Granier de Cassagnac, a deputy and journalist, who in his various speeches most strenuously opposed the liberty of the press, has also sent a challenge to one of the editors of *Figaro* for having, as he complains, spoken in disrespectful terms of his father. This affair is also still unsettled. Another rumor has spread of a dispute likely to be settled by the sword in the highest rank of society, but I should not be justified in giving you the names at present.

The young Prince of Denmark has made quite a hit in Paris. The *beau monde* say, "qu'il est brillant et spirituel." Every day some new *bon mot*, either really his or manufactured for him, is attributed to him and eagerly passed from salon to salon.

Speaking of illustrious visitors reminds me of the popularity of the young King of Portugal during his stay here. You will probably remember that while in Paris he paid several visits to the celebrated maestro Rossini. On one of these occasions, it appears, the young King promised Rossini that on his return to Portugal he would send him as a present some port wine such as he had never tasted. It appears, also, that on his return to Portugal the King forgot his royal promise, till the musician, tired of waiting, and determined not to lose the promised gift, wrote the following letter:

"You promised me some port wine, sire, and I have not yet received it. Your Majesty cannot surely have forgotten this promise. Kings forget nothing; but permit me, sire, to remind you that I am an old man, and that at my age one grows impatient at waiting."

I do not know whether the plain-spoken reminder had the desired effect. Very probably it had, and no doubt Rossini has already made himself familiar with that august wine, the flavor of which must have reminded him of *Don César's* famous monologue:

"Goûtons d'abord ceci—c'est une œuvre parfaite
De ce puissant poëte appelé le soleil!
Xères-les-Chevaliers n'offre rien de pareil."

Although we are in Lent, most of our fashionable saloons are still open for music and dancing. The soirée given by the Duchess of Fitzjames was most brilliant. The Princess Dadiani had a grand reception at the Hôtel du Louvre. There have been three official dinners at the Tuileries, and a ball on a large scale is contemplated by the Empress, but as yet no day is fixed. Finally, to wind up the winter (I mean, of course, the winter of the *monde élégant*), two fêtes are to be given by the Minister of Foreign Affairs for the benefit of the works of the schools of Saint Joseph. These fêtes are to be superintended by the Countess Tascher de la Pagerie, and are to come off on the 18th and 20th of next month. The unusually splendid scale upon which they are to be got up is already the talk of our fashionable faubourgs, and it is supposed that Madame Tascher, who lives at the Tuileries, will shortly be quite besieged with applications for tickets.

Prince Napoleon will leave Paris in a few days for Naples. He has succeeded in selling his hotel in the Avenue Montaigne, known as the Maison de Diomède, to M. de Quinsonas for nearly £50,000. This gentleman is also the proprietor of that magnificent hotel built by Prince Sothkoff which is contiguous to that of Prince Napoleon.

Our amateurs of dancing are anxiously awaiting the arrival of an *artiste* who surpasses everything that has as yet been witnessed. This young lady's name is Woronsoff. M. St. Léon has composed a ballet in order to show off the superior choregraphic abilities of this Russian *danseuse*, who has been engaged by the Académie Impériale de Musiqu

A new ballet was brought out the day before yesterday at the Italiens called "La fidanzata valacca," music by M. Maximilian Graziani. On the same evening the new opera of "Crispino e la Comare," by the maestri Ricci, was admirably well performed. The brothers Ricci are now in Paris, and superintended the rehearsals.

Within the last week we have lost two of our celebrated musical composers—M. Pacini and M. Clapisson. M. Antonio Pacini was born at Naples in 1778. He studied music under Cimarosa, Fenarolli, and Paesiello. In his younger days he was a great patriot, and joined Championnet in his attempt to establish a Parthenopian republic. He was one of the defenders of Castelnuovo at the time when it was besieged by Cardinal Ruffo and Ferdinand IV. in the presence of Nelson. The band of patriots commanded by Admiral Caracciolo were ultimately compelled to capitulate after an heroic defence. Notwithstanding this Caracciolo was hung and the prisoners decimated. Pacini made his escape and eventually reached Marseilles. Deprived of all resources, he made his way to Nismes on foot, where he literally fell down in the street through sheer exhaustion. Whilst in this position he happened to hear somebody standing near say that the theatre was in want of a violinist. He stood up and, as if encouraged by the remark, offered himself and was accepted. He soon became the general favorite of the town and eventually married a French lady. Finding his reputation on the increase, he came to Paris and brought out at the opera "Isabelle et Gertrude," which was performed for seventy-five nights consecutively. Shortly after this he was appointed music master and accompanist to the Princess Borghese, the Queen of Sweden, and several other high personages. He is the author of those popular songs, "Portrait Charmant" and "Mi giuri che mi ami." In those days foreign music was copied, not engraved, and it was Pacini who first published engraved copies. This maestro very soon became one of the most eminent of our music publishers. Rossini entrusted his works to him. His select evening parties were composed of all the most celebrated musical composers of the day—Rossini, Bellini, Donizetti, and Niedermeyer. On his general reception days were to be seen such men as Field Marchangy, Soumet, Duret, Emile Deschamps, and Chopin. Pacini never returned to Naples, but brought up all his children in the love of Italy. He lost his wife some two years back.

Clapisson, who was buried last Wednesday, was one of our sweetest composers, and wrote the opera of "Baron Trenck." He was also the author of several popular ballads and one of the professors at the Conservatoire of Music.

M. Cesare Cantù, the illustrious Italian historian, is expected in Paris at the beginning of next week. This gentleman was one of the deputies of the Italian Parliament, and lately visited Rome, where he had several audiences with the Pope and Cardinal Antonelli. It is said that his visit to Paris is connected with the Roman question.

The subscription for the erection of a monument to the memory of General Lamoricière has already reached 150,000 francs. Of this sum 100,000 francs are to be spent for a monument to be placed in one of the public squares of Nantes, and the remainder is to be devoted to charitable purposes and the erection of a monument to General the Marquis de Pimodan, who was killed at the battle of Castelfidardo, September 18, 1860.

Yesterday I paid a visit to the Champs de Mars to see what progress had been made in the building for the universal exhibition of 1867. I cannot say I was delighted so much as I was astonished. There I found a regular army of workmen amounting to some thousands, the greater portion of them dirty and ragged. Nearly every language in the civilized world was to be heard, and, for the first time in my life, I realized to my mind what the scene must have been at the building of the Tower of Babel. As to the works, one would imagine that pyramids were to be raised or several cathedrals built. Those who have not lately visited Paris would find a difficulty in recognizing the Champs de Mars. On all sides buildings are rising and the ground fetches enormous prices. But notwithstanding all this busy move ment one can form no idea of what the building will ultimately be, for as yet it has hardly risen above the level of the ground. This much is certain, however, that it will be opened in the month of May, 1867.

Correspondence.

ROBERT OWEN'S PHILOSOPHY.

TO THE EDITOR OF THE NATION:

In the number of THE NATION for March 8th appeared a notice of "The Life of Robert Owen," recently published in Philadelphia. The author begs to assure the reviewer that he takes his strictures in good part.

Indeed, he feels under a positive obligation to him for supplying so conclusive a reply to his own question, "Why was this biography written?"

If it is true, as the reviewer intimates, that "the philosophy which teaches that man is a creature of organization and circumstances—the subject of conditions and the result of law"—is the philosophy of Buckle and Draper, and that in combating it these are the men, and not Owen, who are to be met, the author of the biography readily admits that he is not "the man for that."

But, creeping comes before walking. While Buckle and Draper are moving among the savans, Owen is seen among the hard-fisted, bare-armed occupants of the workshop and factory. His theory is mature enough for the grade of mischief which it is designed to do, and his doctrines are strong enough to overturn the foundations of society, if once adopted; and why should a common, plain man like the author of the biography ascend to the uppermost seats of the synagogue of modern "sociology," where Buckle and Draper receive honor?

Far better that he should concern himself with the A, B, C of the science contained in Owen's "immature theory." And this is his apology for the book. Buckle and Draper are theorists; Owen applied his principles to living men, and the biography shows with what success. Out of Owen's egg will infallibly come Buckle and Draper's chicken, however difficult it may be to recognize one in the other. If a man is satisfied, from Owen's experiment, that in all social reforms reference must be had to the supreme law of Jehovah, which governs alike the motions of the planets and the falling of a sparrow, that man will never be a disciple of the Buckle and Owen school.

[We doubt whether the writings of Robert Owen are exerting the injurious influence upon the working-classes in this country that the writer of the above letter supposes. But, if they are, he is perfectly right in assailing them with all possible vigor wherever he finds them. We have no more sympathy with the drift and tendency of those writings than he has. We still believe, however, that his work would be better done if done with less of the theological, and more of the ethical and scientific, animus. His book does not sufficiently meet practical issues. We sincerely trust, nevertheless, that it will do good. —Ed. Nation.]

Literature.

LITERARY NOTES.

Mr. Alexander Strahan, of the firm of Strahan & Co., an English publishing house which opened a branch here last year, has something to say in a late number of "The Bookseller" concerning the way in which his firm has been treated by the authorities of the New York Custom House, and by several New York publishers, who sat like a jury on his invoices, and rendered some extraordinary verdicts. The facts of the case are that, in November last, Mr. Strahan sent three consignments of books to the agent of Strahan & Co. in New York, the market value of which books was £374 8s. 2d. They arrived here, but were not delivered to the consignee on the payment of the regular duty of twenty-five per cent., being detained by somebody in the Custom House until some New York publishers should have an opportunity to examine them, and to judge whether or no they were honestly invoiced. It was after the middle of January that the books were subjected to such examination, the result of which may be guessed from the fact that the first item which came up, one thousand copies of a little book published by Strahan & Co., and sold by them for eighteenpence in boards, and invoiced at the rate of sixpence a copy, was declared to be worth one shilling and ninepence in London! The consignee showed that the book was sold there in dozens, at eightpence halfpenny a copy; which led to the enquiry why it was invoiced at sixpence, whereupon he stated that it was sold for much less in thousands than in dozens, and observed also that Strahan & Co. had some time previously manufactured for an American firm one thousand copies of a three-and-sixpenny volume for tenpence a copy, which gave them a profit of ten per cent. This circumstance had no weight with the judges, one of whom declared that the transaction could not have been a regular one, and that, even if it were, it should not be made a rule. On a final appraisement the one-and-ninepence a copy, the pretended value of an eighteen-penny volume, was reduced to ninepence, with the intimation, however, that all the books were confiscated. The Custom House authorities offered to sell them to the consignee for £800, and then for £600, both of which offers were declined. The books being in demand, he made an estimate of the price at which they could be manufactured here, and offered that sum for them. It was accepted, as well, indeed, it might be, being just £400 in excess of the original duty of twenty-five per cent. Such, in brief, is the substance of Mr. Strahan's statement, no one particular of which has been, or attempted to be, disproved. The judgment which all fair-minded men will pass upon this case is not likely to be a favorable one, either for the American publishers who concerned themselves about Strahan & Co.'s books, or for the authorities who confiscated them. As regards the first, one of two things is evident, either that they were ignorant of the low rates at which books can be manufactured in England, which it is not easy to believe, for many reasons, or that they were determined to do what they could to keep English books out of the American market. A subsequent attempt on their part to have a double duty imposed upon foreign books, viz., a tax of twenty-five cents a pound in addition to the duty of twenty-five per cent., favors the last supposition, which is a discreditable one in whatever light it is looked at. For the Custom House authorities something can be said both for and against their action. It was their business, of course, to see that the Government was not cheated of its dues by the means of fraudulent invoices; but it was equally their business to know the value of what they were to collect duties upon. They attempted to arrive at this knowledge in the case of Strahan & Co., but did not succeed, not much to their regret, we may suppose, since the Government was benefited to the extent of four hundred pounds. The office of appraiser of books, if there be such an one, demands a familiarity with books, new and old, and a remembrance of prices possessed by very few men, and scarcely to be expected in one at all likely to attain such an office. It is not too much to say that neither the present incumbent nor his predecessor possessed these requisites. The former was much complained of for the delays which attended his examination of books, especially old books, which we have known to be detained for weeks in his department. How unfitted for their places ordinary appraisers of books sometimes are may be gathered from the fact that one of these officials once seized the reprint of the first folio of Shakespeare, which was invoiced at £5, its full value, for the first folio itself, which, he justly observed, was worth £100. He had to be shown the date of the reprint, which was some two hundred years later than that of the original edition, before he could be convinced that the Government would not be defrauded by his passing the volume at the price it was invoiced. To return to Strahan & Co. They have been hardly treated by the Custom House and the trade, but they must not confound these interests with the expression of American feeling towards them. They publish good books and good magazines, both of which we need, and there is no reason why they should not succeed in New York as they have done in London.

—The list of new books in press by Messrs. Ticknor & Fields promises an unusual amount of good reading for the summer and fall months. It is as follows: "Life of Josiah Quincy, of Massachusetts," by his son, Edmund Quincy; "The Origin and History of the Books of the Bible," by Calvin E. Stowe, D.D.; "The South Since the War," by Sydney Andrews ("Dixon," of the Boston *Daily Advertiser*); "Biglow Papers, Second Series," by James Russell Lowell; "Royal Truths," by Henry Ward Beecher; "Summer Rest," by Gail Hamilton; "The Picture of St. John," by Bayard Taylor; "Life and Letters of James G. Percival," by Julius H. Ward; "The Masquerade and Other Poems," by John G. Saxe; "The Yankee in Canada," by Henry D. Thoreau; "The Complete Poetical Works of Miss Muloch;" "Fifteen Days," by the author of "The Record of an Obscure Man;" "Spare Hours, Second Series," by Dr. John Brown; "Drift, a Sea-shore Idyl, and other Poems," by George Arnold; "Journal of Travels in Brazil," by Professor and Mrs. Agassiz; "Treasures from the Prose Works of John Milton;" "Companion Poets, Volume Second;" "The Complete Prose Works of John G. Whittier" (new edition); "Rainbows for Children," new edition; "Breathings of a Better Life," edited by Lucy Larcom; "Lectures on Greece, Ancient and Modern," by the late President Felton; "Boys' History of England," by Charles Kingsley; "Christina Rossetti's Poems;" "Stories of Many Lands," by Grace Greenwood; "Mrs. Aker's Poetical Works;" "Character and Characteristics," by E. P. Whipple; "Dante's Vita Nuova," translated by Charles E. Norton; and "The Divine Comedy of Dante," translated by Henry W. Longfellow.

—Messrs. Hurd & Houghton have in preparation a complete and uniform edition of the works of Lord Macaulay, based upon the last English edition, edited by his sister, Lady Trevelyan. It will be comprised in sixteen or seventeen volumes crown octavo, the first instalment of which, the "History of England," will be published early in May. It will be followed, at

intervals, by the speeches, the essays, the poems, and the introductory report on the Indian penal code, with the notes appended to that code, explaining and defending its leading provisions. The letters of Lord Macaulay to the Bishop of Exeter, touching that divine's criticisms in regard to some of his statements concerning the Church of England, will be given in an appendix, when they will see the light for the first time in this country; and a number of notes will be added showing the main points of the controversy between Lord Macaulay and the defenders of Penn.

—Autographs of Gray, the poet, are not of common occurrence, and when in the market they usually command high prices, as witness the sale of the original manuscript of the "Elegy," twelve years ago, for £131. They occasionally turn up, however, at reasonable rates, three now being on sale in London. The first, which is in the catalogue of John Waller, dealer in literary curiosities, is a collection of holograph extracts containing love songs from the French, among which is the famous one of Henry the Fourth, "Ma charmante Gabrielle," and a satire on Rousseau, mentioned in the correspondence of Gray and Mason; selections in Greek, Latin, and English; besides a long list of biographical extracts upon Italian history, curious pamphlets, etc., in the library of Cambridge University. This manuscript, which consists of seventeen pages, may be had for two pounds ten shillings. The second and third relics, which are books that once belonged to Gray, are in the catalogue of Francis Harvey. They are, first, "London and its Environs Described; being an account of its Publick Buildings, Gentlemen's Seats and their contents, and whatever is most remarkable for Grandeur, Elegance, Curiosity, or Use," six volumes octavo, filled with illustrative and corrective notes in the handwriting of Gray, relating to antiquities, pictures, people, and things, all of which is set down at nine guineas; and, second, two pocket-books of the years 1755 and 1760 filled with Gray's notes, mostly concerning his studies in botany and natural history, which pocket-books are not dear at the five guineas demanded for them. Mr. James T. Fields, of Boston, who was in London when the Gray collection was sold, has one or more of his books in his possession; and a collector of this city has the good fortune to own Gray's copy of a collection of old voyagers and travellers, Marco Polo, Mandeville, Benjamin of Tudela, and others, in French—a splendid quarto filled with notes in the neat, punctilious handwriting of the poet, and of great interest as showing the extent of his reading on out-of-the-way subjects, as the geography of ancient Asia and the dynasties of Turkish and Tartar kings. This volume, which was printed at the Hague and is adorned with fine engravings on steel, formerly belonged to Gray's friend, Mason, whose book-plate it has, and, later, to William Mitford, the editor of some of Pickering's "British Poets." How it was allowed to cross the Atlantic is a mystery which we have never been able to explain.

—There appeared fifteen years ago at Allahabad the first part of "The Life of Mohammed, from Original Sources." This work, which brought the history of the Prophet down to his arrival at Medinah, two months later than the Hejira, was written by Dr. A. Sprenger, who had had access to many old and curious manuscripts which were not known to the Arabic scholars of Europe, and whose value was at once recognized by them. Ten years passed and no further instalment of it was published, but at the end of that time Dr. Sprenger brought out, at Berlin, the first volume of a German work on the same subject, the third and last volume of which was recently published, the whole being the best life that we have yet had of the founder of the Mohammedan faith. The view taken by Dr. Sprenger of Mohammed is, that he was not the creator, but the creature, of the circumstances that surrounded him, the force of which led him to assume the character of a prophet, and so to become the founder of a new faith. He removes him, in short, from the pedestal of good or evil on which previous biographers had placed him, and brings him, as he should, within the pale of history, where his life and character are at least intelligible.

—The volume of monographs of the Palæontological Society for 1864 will shortly be issued, and the volumes for 1865 and 1866 are in preparation, many of their illustrations being already printed. Among other subjects they will contain five new monographs: "The Crag Foraminifera," by T. R. Jones, W. K. Parker, and H. B. Brady; "Supplement to the Fossil Corals," by Dr. Duncan; "The Crustacea of the Older Formations," by H. Woodward; "The Silurian Brachiopoda," by Mr. Davidson, with an introduction by Sir Roderick Murchison; and "The Fishes of the Old Red Sandstone," by R. Lancaster and J. Powry. Four monographs will be continued from earlier volumes: "The Cretaceous Echinodermata," by Dr. Wright; "The Trilobites," by J. W. Salter; "The Belemnites," by Prof. Phillips; and "The Pleistocene Mammalia," by B. Dawkins and W. A. Sandford. The two new volumes may be looked for before the close of the present year.

—Mr. John Russell Smith has lately published, under the title of 'Shakespeare's Jest Book," that famous old collection, the "C. Mery Talys." An edition of this work was reprinted in 1864 by Mr. W. C. Hazlitt, the editor of Marston and Lovelace, from the only copy then known to exist, which was discovered in 1819 by Mr. Conybeare, and reprinted at the time by Mr. Singer. This copy was imperfect in several places, twenty-six of the tales wanting whole lines, while six were too much damaged to be deciphered at all. A perfect copy has since been discovered by Dr. Herman Oesterley in the University Library at Göttingen, bearing the imprint of Rastell, and the date of 1526; but whether that or the previously discovered fragment is the original has not yet been settled. The difference between the two copies is considerable; Dr. Oesterley's, while it omits three tales, contains four tales, and three "morals," not included in Mr. Hazlitt's reprint.

—The last number of Trübner's "American and Oriental Literary Record," which has now completed its first year, contains a summary of the number of works recorded therein during that time, amounting in all to 4,360 in different languages. Of these 1,775 were published in the United States, 110 in Canada, 22 in Mexico, 69 in Cuba, 135 in Peru, 128 in the Argentine Republic, 40 in China, 78 in Holland and India (relating to the Dutch possessions), and 55 at Constantinople. The number of English books published in India and catalogued in the "Record" is 343, which is considerably less than those in its native languages and dialects, amounting to 411 Sanscrit works, 29 Gujarati, 78 Hindustani, 92 Hindi, 105 Marathi, 369 Bengali, 28 Malay, 13 Malayman, and 25 Canarese, most of which have now been for the first time introduced to Europe. The "Record's" list of works on special subjects is much the largest ever published, its fifth number, for instance, embracing 122 on the "Zendavesta and the Zoroastrian Faith," and 186 on our late civil war. The Dante celebration of last spring brought forth a literature of its own, of which the "Record" chronicled 134 specimens, in Italian, French, German, and English. Thus much for what the "Record" has already done. In future numbers we are promised a full account of Mexican literature during the last ten years, and details of the works published in Guatemala, Chili, Venezuela, New Granada, Ecuador, and Bolivia; an important list of works relating to Persian, Arabic, and Turkish literature, besides an interesting account of Jewish literature in Hebrew. Altogether the "Record," brief as it is, is the most valuable work of the kind ever published, and one which no person interested in Oriental studies should be without.

—The difficult feat of two men writing novels, as Beaumont and Fletcher wrote plays, and with the success which crowned the joint authorship of those brilliant masters of our early drama—a feat never attempted, we believe, in England, and but once in this country, when the late G. P. R. James and Mr. Maunsell B. Field produced between them a forgotten novel, "Adrian, or Clouds of Mind"—this remarkable feat, we say, has been, and still is being, accomplished in France, by two writers of repute, Emile Erckmann and Alexandre Chatrain, who have written together at least six novels within the last four or five years. These novels, which are published with the names of both authors interlinked on their title pages—"par Erckmann-Chatrain"—are worthy of being better known than they appear to be in England and America, redeeming, as they do, the character of French fiction, which is at present under a cloud outside of France, and against the sins of which they are at once a protest and a corrective. They differ as widely from the common run of French novels as Freytag's "Debit and Credit" did, and does, from those of Germany, showing the possession of certain qualities which are rather English than French, and which, so far, have found their fullest fruition in the author of "Waverley." The earliest works of the Erckmann-Chatrain firm, "L'illustre Docteur," "Contes Fantastiques," "Contes de la Montagne," "Maître Daniel Rock," and "Contes des Bords du Rhin," attracted but comparatively little attention, although they prepared the way for the large circle of readers which these writers can now command. It was not until the appearance of "L'Invasion, ou le fou Yégof," four years since, that they began to have a name. This novel, which originally appeared in the "Revue des Deux Mondes," is a history of the invasion of 1814, related by an old huntsman of the Vosges, who witnessed it, and the desperate deeds of a handful of peasants who attempted to resist it, headed by a visionary and madman, "le fou Yégof." It was followed the next year by a volume containing "Confidences d'un Joueur de Clarinette," a simple but most pathetic story, told by its hero, a poor village musician who had been crossed in love, and "Les Amoureux de Catherine," a vivid and truthful picture of village love. Then came "Madame Thérèse," the history of a *cantinière* who followed the republican armies or

1792, and was left for dead after an engagement with some Austrian troops in a village of the German Vosges, where she was found and borne to the house of the village doctor, who restored her to health, fell in love with her, embraced her republican notions, and finally married her. Within the last three years the greatest of the Erckmann-Chatrain novels have been published—"Le Conscrit de 1813" and "Waterloo (suite de Conscrit)," which describe the incidents of a soldier's life, and with such vividness and truthfulness that it is not easy, while reading them, to regard these works as fictions. The air of *vraisemblance* is admirably kept up, the authors never for a moment forgetting the personality and surroundings of the young soldier whose autobiography they are writing, and whose condition they realize perfectly. Never before in fiction was the story of the latest of the Napoleonic wars so well and so effectively narrated; every page is a picture; and what a lesson runs through all, if only the French people had the wit to see it! The subsequent works of Erckmann-Chatrain are "L'homme du Peuple," a story of the Revolution of 1848, issued last year, and "La Maison Forestière," which was recently published. Of the authors of this remarkable series of novels we know little, except that they were born in one of the eastern departments of France, and were brought up together from childhood. Like the gallants in the old comedy who always "hunted in couples," they never write except together. "We hold the pen by turns," they have said, "and we should be sorely puzzled, as regards many pages of our works, to say by which of us they were written." It will not be long, we fancy, before the Erckmann-Chatrain novels will be translated and republished here. At any rate, the two best could not fail to be successful.

—A strange and wild, but remarkable, genius was Alexander Petöfi, a Hungarian poet, whose writings have been lately translated into German by K. M. Kertbeny. The son of a poor butcher, Petöfi learned nothing at school, from which he ran away to become an errand boy, a soldier, a bad actor, and, what is much the same thing, a vagabond. He managed, however, to pick up one or two modern languages, and to be a poet. An Hungarian newspaper, whose "poet's corner" he probably filled gratis, having encouraged him, he set out one day in the middle of winter to walk from Debreczin to Pesth, with his manuscripts under his shirt, a stout stick in his fist, and only three shillings in his pocket. Reaching Pesth, he introduced himself to the leading poet, Vörösmarty, who, after hearing him recite his poems, said, "You are the only lyrical poet that Hungary has ever had, myself not excepted. We must take care of you." From that time Petöfi was a made man, his mind and his poetry refining with wonderful rapidity; the latter, indeed, flowed from him with marvellous fluency and ease. He became a journalist and a politician, and when the Hungarian Revolution broke out served as an aide-de-camp under General Bem, disappearing at the battle of Schässburg, where Bem only saved himself by plunging into a bog. Petöfi's body was never found; no trace was left of him except his poetry, which has left its mark in Hungarian literature. It is by turns like that of Byron and Burns—like Byron's in energy and fire, though much inferior to it in feeling and thought; and like Burns's in its intense nationality. Petöfi seems indeed to have been to Hungary what Burns was to Scotland—the poet of the land and the people. So far as we know, none of his poems have yet been rendered into English.

THE PROTESTANT CHARITIES OF EUROPE.*

When a book begins its travels, *paucis ostendi gemens*, an ambitious title is often as unfortunate for it as for the human traveller to whom Horace compared it. "James Prince, of Boston," making the grand tour, found that he was served and charged at the hotels according to the common estimate of a prince's revenue, and it was not until he changed the equivocal title that he was allowed the exemptions of an ordinary guest. In styling this book "The Charities of Europe," the publisher has secured a taking name at the risk of a keen disappointment on the reader's part when he finds that it is only a dozen of the *Protestant* charities of the *Continent* of Europe that are here described. Nothing is said of the great English and Scotch charities, nothing of those of Belgium, Italy, Austria, or the other Catholic countries; and of the Protestant establishments of France, Holland, Switzerland, and Germany, which certainly are to be counted by the hundred, only fourteen are here included. Nor does the writer attempt to give any general view, or even a list of those which he omits to describe.

Indeed, this book is but a chapter in the history of the charities of Europe, a history which still remains to be written or compiled by somebody tolerant enough to do justice to Catholic and Jew, Greek, Armenian, and Mohammedan. Mr. De Liefde is not such a man. He looks upon all who are outside of his church as enemies or insignificant persons, and takes frequent occasion to gird at Papists and Pantheists. Yet we owe him many thanks for the book which he has written. It is not perfect nor all-embracing, but it is a good beginning, and we apprehend that the author himself will see the importance of continuing it. He has the credit of writing the most complete and recent account of several of these establishments which has appeared in English, and of having collected more information of a personal nature in regard to their founders and managers than could easily be found in any language.

The plan of the work is simple, and, perhaps, the best for the author's purpose, though not the most instructive to the collector of statistics. We have, first, some little description of the place where the establishment is; then a minute account of the life, character, and religious experiences of the founder and his friends; then some details of the history and management of the establishment; then a few statistics; the whole being interspersed with observations and reflections such as would naturally occur to a person telling the story of such an institution. In this way the interest of the reader is kept up, his love of personal incident and dramatic situations is gratified, and he learns to admire and love the benevolent characters who appear and disappear as the story goes along. But he does not always get a clear impression of the working and results of each establishment, or how it is related to the others, or what is necessary to complete its usefulness. Nor is there much method in the arrangement of the chapters. The first establishment described is that of Herr Wichern, near Hamburg, for neglected and vicious children, founded in 1833; the second is Pastor Fliedner's Deaconess House, at Kaiserswerth, also founded in 1833; but the same volume contains Father Zeller's School at Benggen, founded in 1817, the Deacon House at Duisburg (1844), the Asylum for Discharged Prisoners at Lintorf (1850), and the Orphan Home at Neuhof, opened in 1825. It is evident that neither the order of time, nor of classes, is here followed; nor does it appear that the establishments are described in the order in which they were visited by Mr. De Liefde. In the second volume there is greater uniformity, several establishments of the same class being treated successively; but among the eight there described, there are at least six different classes, and the dates of foundation range from 1819 to the present time.

Indeed, the whole arrangement of the volumes, as well as the style of writing, shows an artless desire to get the facts before the public, without the slightest regard to any method—logical, chronological, or practical. This entire neglect of rhetoric, as we Anglo-Saxons understand that art, is sometimes laughable enough; but, on the whole, it gives a pathetic charm to the recital, in which good faith, humanity, and good sense are at least as conspicuous as bad writing and the lack of an index. This latter deficiency, indeed, is, in part, made up by the running titles at the head of the pages—a style of printing which we would recommend to American publishers.

The best known of all the establishments described by our author is, probably, that of Herr Wichern, commonly styled the *Rauhe Haus*, a name emended by Mr. De Liefde into *Ruge Hoos*. His readers, we fancy, will keep to the old name, but they will learn much that is new from the author's chapters.

We could wish that he had noticed more fully the strong opposition existing in Prussia to the peculiar brotherhood founded by Wichern, in connection with his original enterprise. There must be some reason in the censures passed by Dr. Von Holtzendorff and others who have attacked this interesting order, and we would gladly have seen the matter discussed by Mr. De Liefde.

It will at once occur to persons familiar with American reformatories, how wide is the difference between all these and the multiform establishment of Wichern. Perhaps that which resembles it most closely is the Reform School of Ohio; and this not only in its family system, but in the religious tone of its instructions, and the brotherly relations of the teacher to the pupils. No girls, however, are received at Lancaster, Ohio, while they have been long taught at the *Rauhe Haus*. Our House of Refuge at Randall's Island receives both boys and girls, and so do those at Pittsburgh, Baltimore, and Providence; but, we think, the feeling against associating vicious boys and girls in the same reformatory is growing stronger in the United States. Mr. De Liefde favors their association under proper restraints, and we commend what he says to our countrymen.

We cannot notice, in detail, all the establishments described by our author; we must pass over Fingado's, at Lohr-Dinglingen; Pastor Heldring's, at Hemmen; Suringar's "Dutch Mettray," at Zutphen; and others, of which we would gladly speak. But we cannot omit all mention of Pastor Bräm's unique colony at Neukirchen, in Rhenish Prussia. We call this a colony, not because it is a farm school, like the French Mettray, and its Dutch copy, but because its plan is to colonize neglected children in the families of

* "Six Months Among the Charities of Europe. By John De Liefde. Volumes I. and II., pp. 433, 490." Alexander Strahan, publisher, London and New York.

a wide district without a long previous residence at a reformatory. This has been for twenty years the favorite plan of Bräm, as it was, also, that of old Zeller at Benggen.

"I thank God," wrote Father Zeller, in 1829, "that so many refuges have been opened from the Baltic to the Lake of Geneva. But, dear friends, the establishments are not sufficient, and *but for God's gracious care they might even turn hot-beds of corruption. I therefore beseech you not to rely on them, and least of all on the large ones.* To strike at the root of the evil, the rescuing of neglected children *must become a concern of the Christian family*, and their education must be carried on in the Christian family circle. If in each community only two or three of the poorest children were trained by a Christian schoolmaster, or some other head of a family, something good would be effected. . . *Gradually all existing establishments for training poor children would be superseded.* What is the reason there are no children from Steinthal in our establishment? Because, so long as the Spirit ruled in Steinthal, through that man of God, Oberlin, no child was neglected in the community. And how was it that there were no neglected children at Steinthal? Because there were always some married couples there who voluntarily took the orphans of their deceased neighbors."

During the eighteen years from 1845 to 1863 nearly 300 children were provided for by Bräm, on the principles of Zeller, and with very successful results. The cost of supporting these children has been about fifty dollars a year for each. This is considerably less than their cost in large reformatories, either on the Continent, in England, or in America; while the system itself is believed to be much better for the child, provided the visiting agent (*Diaspora-Pfleger*) attends faithfully to his duty. Such a system has been recommended in Massachusetts, but, apparently, without any knowledge of the Neukirchen experiment.

We wish we had room to speak of Jean Bost's establishments at Dordogne, in France; but we can only refer our readers to the book itself, and to an article which appeared last April in a London magazine, called "Meliora." In some respects this article is more full than Mr. De Liefde's chapters.

The typography and illustrations of the volumes are good, and the work itself deserves a faithful reading by all philanthropists.

NORTH OF THE ZAMBESI.*

It would probably not be an easy task to decide whether Dr. Livingstone's sixteen years' continued residence in South Africa (1840–1856), during which he explored the region of Lake Ngami, discovered the Victoria Falls, and traversed the interior of that continent from the Cape of Good Hope to Loando on the Atlantic, and thence to the mouths of the Zambesi on the Indian Ocean, or his more recent series of African journeys, embracing chiefly the valleys of the Zambesi and its tributaries and Lakes Shirwa and Nyassa, has been more productive of important or interesting results. Nor would a judgment of that kind strictly belong to the sphere of a literary review of the book before us. The results of both the great travelling periods of Dr. Livingstone's active life are almost universally known as a part of the record of African exploration. What we cannot refrain from stating here by way of comparison is that, as a book of travels, the "Narrative of an Expedition to the Zambesi" is, in many respects, greatly superior to the "Missionary Travels and Researches in South Africa," which described the explorer's earlier labors. The new narrative, owing perhaps in part to the co-operation of the younger brother, both as observer and writer, is so rich throughout in lively, terse, and graphic sketches of tropical scenery, of vegetable and animal life, of human savagery in its manifold forms, and of endlessly varying incidents, and so replete with interesting observations, instructive natural comparisons, and piquant or humorous remarks, that we would fain declare it a masterpiece, were it not obviously an unartistic as well as unsystematic mass of details, descriptions, and reflections. But this *négligé* forms one of the principal charms of the book, though it also diminishes its scientific value. The freshness, though not the form, of a diary is preserved throughout. We are made to accompany the traveller from the beginning to the end of his journeys. We observe and study with him everything in its parts, rarely anything at once in its entirety. The characteristics of tribes, individuals, regions, towns, or animal species are seldom presented to our eyes in connected sketches; we must slowly learn them ourselves, so to speak, by repeated glances. We are nowhere troubled with scientific disquisitions—geological, historical, ethnological, or philological. No attempt is made by our guide at the solution of problems.

Dr. Livingstone appears in this book almost exclusively as an exploring traveller; his character as a missionary seems but accidental, though the zealous Protestant is everywhere visible. The more gratifying are the earnest philanthropic spirit and ardent love of liberty which pervade every chapter of this narrative, the subject of which is a part of the world teeming with many blessings of nature, but also scourged with the worst of evils—ferocious beasts, venomous reptiles, desolating droughts, and, worse than all, brutish ignorance, internecine feuds, and a remorseless slave-trade, the latter being carried on alike by Christian Portuguese, Mohammedan Arabs, and heathen natives.

In order to give the reader an idea of the character of the country which forms the scene of the traveller's new explorations and discoveries, we will condense in the following, as far as possible in his own words, a part of the narrative of his earlier excursions into the valley of the Shire, the principal northern tributary of the Zambesi.

The first trip to the Shire was undertaken in January, 1859. A considerable quantity of duckweed floated down the river near its mouth, but was insufficient to check the ascent of our explorers' boat. As they approached the villages the natives collected in large numbers, armed with bows and poisoned arrows, some dodging behind trees and taking aim, the women being sent out of the way. At one place at least five hundred were assembled, and the boat was ordered to stop. Dr. Livingstone went ashore, and explained to the chief, Tingane, a well-made, grey-headed man, over six feet high, that they were English, and that their object was neither war nor slaving, but to open a path for peaceful intercourse and exchange of goods. The chief at once became friendly, called his people together, and made the declaration of the explorers known to them. The presence of the steamer, and some information, already gained by the natives, of the efforts of the English at sea to stop the slave-trade, the terrible scourge of the country, contributed to this favorable result. The belief of the natives in a supreme being, the creator and ruler of all things, facilitated here as well as elsewhere the communication by the missionary of some of the rudimentary tenets of the Christian religion, the interpreter indulging in his habit of winding up with, "The book says you are to grow cotton, and the English are to come and buy it," an addition which, considering the practical side of English philanthropic enterprises—we beg Dr. Livingstone's pardon—was not an empty joke.

The party followed with delight the meanderings of upward of two hundred miles of the river, now explored for the first time. All its lower part was at least two fathoms deep, but it became shallower higher up. Care was now necessary to avoid the suspicions of the African crowds watching on the banks day and night. At 15° 55′ south latitude further progress with the steamer was arrested by magnificent cataracts, which, in honor of the president of the Royal Geographical Society, a generous patron of the expedition, received the English name of "The Murchison." To risk a land journey was, under the circumstances, deemed imprudent, and the steamer, aided by the current, soon rapidly glided down the Shire on its return to the Zambesi. The hippopotami always got out of its way; the crocodiles, on the contrary, mistaking it for some huge swimming animal, sometimes rushed at it with great velocity, keeping about a foot from the surface, raising the head out of the water when only a few yards from the expected prey, and then, without touching it, suddenly going down to the bottom like a stone.

The second trip on the Shire was begun in March of the same year. The natives were now found friendly, and readily sold rice, fowls, and corn. Amicable relations were entered into with Chibisa, the most intelligent chief by far of the Cataract region, a remarkably shrewd African. He spoke in terms of high self-consciousness of his past career of battle and dominion. He had done a great deal of fighting, but it was always others who began, and he was invariably in the right. Awed by his power and wisdom, the people feared and reverenced him. He spoke as if he fully believed in himself; the people, too, believed in him, and, trusting in his medicines, bathed in the river without fear of crocodiles.

Opposite Chibisa's village, Dr. Livingstone and his companion, Dr. Kirk, left the vessel and, accompanied by a number of Makalolo Africans, started on foot for the discovery of Lake Shirwa. Their way led them through a mountainous country. The people were ill-disposed, some of the guides treacherous, others ignorant. At last they pushed on without guides, or only with crazy ones; "for, oddly enough, they were often under great obligations to the madmen of the different villages. . . . These poor fellows sympathized with the explorers, probably in the belief that they belonged to their own class, . . . and often guided them faithfully from place to place, when no sane man could be hired for love or money."

The Manganja who inhabited that region, at the time unscourged by slave-hunting, showed themselves independent, defiant, and threatening; but the friendly bearing of the travellers prevented a collision, and their

* "Narrative of an Expedition to the Zambesi and its Tributaries; and of the Discovery of the Lakes Shirwa and Nyassa. 1858–1864. By David and Charles Livingstone. With map and illustrations." New York: Harper & Brothers. 1866.

perseverance was finally crowned with success. On the 18th of April they discovered Lake Shirwa, a large body of bitter, slightly brackish water, without an outlet, abounding in leeches, fish, crocodiles, and hippopotami. It appeared dotted with islands, some rising out of it like hills and covered with trees. The shore near the place of discovery, which was the base of Mount Pirimiti, was covered with reeds and papyrus. The country around was very beautiful, and clothed with rich vegetation, and the waves, breaking and foaming over a rock on the south-eastern side, added to the beauty of the picture. The length of the lake may be sixty or eighty miles, its breadth twenty. Lofty mountains, called the Milanje range, perhaps eight thousand feet above the sea level, stand near the eastern shore; on the west stands Mount Zomba, a little less high, and some twenty miles long.

The object of the explorers being to gain the confidence of the people by degrees, they soon returned, by another way, to the Shire, and down that river to the Zambesi, and it was not before August that they again steamed up the former stream. The object of this journey was Lake Nyassa, of which they had already gained some information. We now receive a fuller description of the Shire and its environs. This river is narrower and deeper than the Zambesi. It drains an exceedingly fertile valley of from fifteen to twenty miles, bounded on both sides by ranges of wooded hills. Those on the left bank, for the first twenty miles, are close to the river; then comes Morambala, a detached mountain about 4,000 feet in height, and wooded up to the very top. A small village peeps out from its slope, perched above musquito-range, in a pure and bracing atmosphere. The mountain was covered here and there with numerous species of ferns, lemon and orange trees grew wild, and pineapples had been planted by the mountaineers. Horn-bills, hawks, monkeys, antelopes, and rhinoceroses sheltered among large trees at the base. A hot fountain boiled up near the north end, sending off a fine flowing stream of water clear as crystal. A few clumps of palms and acacias appeared west of Morambala on a plain rich in all sorts of game.

Beyond Morambala the Shire winds through an extensive marsh, a broad expanse of fresh green grass. Further north stands the dome-shaped Mount Makanga and then several others with granite-looking peaks, forming the eastern boundary of the valley; another range of metamorphic rocks bounds it on the west. A broad belt of palm and other trees crossed the fine plain on the right bank; marks of elephants and other large game were abundant. Two pythons lay coiled together among the branches of a tree; they were both shot. The banks of the marsh were here and there fringed with gardens of maize, pumpkins, and tobacco, belonging to the natives on the hills. Higher up a deep stream emptied into the Shire, flowing from a broad lagoon which sends off the duckweed of the latter river. At different parts of the stream men were busy filling their canoes with the lotus root, which is extensively used as food.

The little steamer could not carry all the hands needed; to lighten her some were put into the boats and towed astern. In the dark one of these was capsized, and one African perished. This happened on the first day. It cast a gloom over the travellers. Besides, the steamer leaked badly, the cabin floor was almost always wet, and the cabin a breeding-place for musquitoes.

The country improved as they ascended; the rich valley became less swampy and adorned with trees. Both banks were dotted with hippopotamus traps. One of these animals, frightened by the steaming vessel, ran directly under a beam-trap, was immediately struck by the poisoned spear-head, and, in its agony, plunged back into the river soon to expire, furnishing a feast to the natives.

Tingane's village was now reached again. His war-drums could speedily muster some hundreds of warriors, armed with bows and poisoned arrows of superior workmanship. Of these the slave-hunting parties of the half-caste Portuguese Mariano, the desolators of the country, stood in great awe. Tingane's people were friendly, and covered the banks with a variety of articles for sale. A little above the village the Ruo joined the Shire. A short way beyond it lay Lake Mukulu, called by our explorers Elephant Marsh, on account of the vast herds of those animals frequenting it. Some eight hundred of them were in sight at once. A majestic mountain, now surnamed Mount Clarendon, loomed in the distance, and further north the end of the Milanje range rose in form of an unfinished sphinx, looking down upon Lake Shirwa.

The following descriptive paragraph, the fullest, we believe, of the book, may serve to complete our scanty extracts, as well as to show the sketching power of the author or authors:

"The Shire marshes support prodigious numbers of many kinds of water-fowl. An hour at the masthead unfolds novel views of life in an African marsh. Near the edge, and on the branches of some favorite tree, rest scores of plotuses and cormorants, which stretch their snake-like necks, and in mute amazement turn one eye and then another toward the approaching monster. By-and-bye the timid ones begin to fly off, or take 'headers' into the stream; but a few of the bolder or more composed remain, only taking the precaution to spread their wings ready for instant flight. The pretty ardetta, of a light yellow color when at rest, but seemingly of a pure white when flying, takes wing, and sweeps across the green grass in large numbers, often showing us where buffaloes and elephants are by perching on their backs. Flocks of ducks, of which the kind called 'Soriri' is most abundant, being night-feeders, meditate quietly by the small lagoons until startled by the noise of the steam machinery. Pelicans glide over the water, catching fish, while the scopus and large herons peer intently into pools. The large black and white spur-winged goose springs up and circles round to find out what the disturbance can be, and then settles down again with a splash. Hundreds of linongolos rise on the wing from the clumps of reeds or low trees, on which they build in colonies, and are speedily high in mid-air. Charming little red and yellow weavers remind one of butterflies as they fly in and out of the tall grass, or hang to the mouths of their pendant nests, chattering briskly to their mates within. These weavers seem to have 'cock nests,' built with only a roof, and a perch beneath, with a doorway on each side. The natives say they are made to protect the bird from the rain. Though her husband is very attentive, we have seen the hen-bird tearing her mate's nest to pieces, but why we cannot tell. Kites and vultures are busy overhead, beating the ground for their repast of carrion; and the solemn-looking, stately-stepping marabout, with a taste for dead fish or men, stalks slowly along the almost stagnant channels. Groups of men and boys are searching diligently in various places for lotus and other roots. Some are standing, in canoes, on the weed-covered ponds, spearing fish, while others are punting over the small intersecting streams to examine their sunken fish-baskets."

THE WAR MUSE.*

POETRY of the war—not *the* poetry of the war, as if Mr. White had gathered up either all the verse that was not poetry or all the poetry that was not verse which the war produced. His purpose was a different one from that, and a better; it was to select all that appeared worthy of preservation on any account. Merit has not been the only consideration. Verses that at all worthily or spiritedly celebrated any important event in the war, which expressed truthfully any mood of popular feeling, or which embodied any type of character, whether enduring or the transitory creation of the circumstances of the day, have been deemed peculiarly fit for this collection. We cannot agree with him when he says that "no poem of conspicuous worth elicited by the war will be found lacking in these pages;" but we can give him credit for a sufficient variety of all kinds to express every phase of emotion that came to the surface during that eventful period of civil strife. The pieces have been culled from kitchen and from flower garden alike. Volumes, monthly and weekly magazines, daily papers, street ballads, have been ransacked, and the characteristic specimens are put together in true democratic order. Longfellow's poem, "The Cumberland," is in close proximity to Brownell's "All We Ask is to be Let Alone," which is immediately preceded by Francis J. Child's droll version of Lilliburlero. Clarence Butler's "Apocalypse," William Ross Wallace's "National Anthem," and Bryant's "Our Country's Call," are followed by Fitz James O'Brien's rollicking lines, entitled "The Seventh," set to the tune of "Gilla Machree." This is as it should be, for this is as it was. The call, the rally, the charge, the retreat, the victory, the disaster, the wail for the dead heroes, the widow's lament, the mother's broken-hearted sigh, poured out simultaneously, and were mingled with the wild chorus of the soldiers, the rude camp song, the hoarse laugh of the populace, the mad rhyme of the fanatic, and the ribald doggerel of the satirist. There were noble strains and strains that were exceedingly ignoble, and the noble and ignoble alike bore the burthens of the people's heart in those years of prayer and passion, of inspiration and demoniac possession, of wrath and the praise that God brings out of wrath. All the chords of feeling were swept at the same instant by the same swift hand, and the effect was not harmonious on the human ear. The prevailing spirit, however, was grand and high, and we think Mr. White was no more than just to the popular sentiment when he included in his collection so many of the solemn hymns which expressed the undertone of the national feeling. He was right in printing a fair proportion of the effusions of the Southern bards, too, for they were inspired, or perspired, by the war as much as ours were; and if, in point of intellectual, moral, and literary character, they are far below the productions of the Northern minstrels, they serve to declare the more forcibly the immeasurable difference in the source from which the inspirations came.

Mr. White includes in his little volume "The Present Crisis," by Lowell, which was published many years before Sumter fell. This, also, is well; and it

* "Poetry of the War. By Richard Grant White." American News Company. New York. 1866.

would have been not unfitting to admit one or two more pieces of the same period; one or two of Whittier's, for instance. For the war did not begin in April, 1861; then it came to the arbitrament of arms; but the moral warfare had been raging for a generation before that; and that ideal strife found poetic expression in some of the noblest lyrics that the heart of America has put in words. The later war, the battle on the field, has not, it must be confessed, given birth to much poetry of a high order. It has created no poets; it has brought few poets into prominence; and it has touched no poets of eminence to issues finer than they had attempted already. The war-pieces of Longfellow and Lowell fall far below those that were prompted by a different muse. Even Whittier's war poems are no better, to say the most, than the best things he had done before; in our judgment, they are not as good. Mr. Boker, excellent as he was now and then in description, did not surpass himself; and Mrs. Howe had earned high fame as a poet years before she wrote the "Battle Hymn of the Republic." Mr. White concedes this fact, and accounts for it by saying that great events are no pledge of great inspirations, and that the poet does his best when his material does not oppress his genius, but stands in easy relations to it for mastery and manipulation. This is no doubt true; but it is also true that no inspirations of an exalted order come from war. Its terrific forces, its passion, its violence, its hideous noise and smoke, the fierce brute elements it stirs up and lets loose, are fatal to all free and beautiful expression of poetic feeling. Only one species of poetry, and that not the highest, is born of the war spirit—the poetry of description; and that owes its charm to the same rush and breathlessness that characterized the battle itself—though to this there are exceptions, such as the "Marseillaise," "Mourir pour la Patrie," and others. Brownell's "Bay Fight" and "River Fight" are splendid things in their way, but they are simply fights finding voice in words. They reproduce the actual conflict at the moment of its raging; the thunder of the cannon, the shouting of the captains, the crash of the timbers, and the flame of the conflagration roar and glare in every line. They are powerful pieces; but they can hardly be called poems.

In a war like ours, especially, where the people themselves fought, and the poets were among the combatants, the poetic spirit had the least possible opportunity for expression. Tennyson may sit in his study in the Isle of Wight and celebrate the charge of the Light Brigade, the rumors whereof came to him from the other side of the world. Campbell could sit quietly and at his leisure pen the "Battle of the Nile." But our poets were trembling for their homes; the battle was raging in Pennsylvania; they could almost hear the noise of the guns; their wives and daughters were ministering to the wounded men; the telegraph had one end of its wire attached to their heart-strings, and with an incessant vibration made their whole being throb and shake. It was impossible, under such circumstances, to obtain the needful calm for thought. The imagination was bewildered, the fancy distracted; incidents could not be sifted; poetical events could not be detached from the rest; the sentiment of history could not be disentangled from the occurrences of history; still less could those occurrences themselves be distilled or transfigured into sentiment. There will be better poetry after the war than there was during the war. When the full results of the war shall appear in a new social order marked by industry, peace, and fine intellectual development, among the loveliest products of that better era will be a poetry as much sweeter and grander than that contained in this volume as that hoped-for time will be blessed above those gloomy days. Nevertheless, we thank Mr. White for his collection, and his publishers for presenting it in such an attractive form.

LUCY ARLYN AND THE STORY OF KENNETT.*

ANY one who happens to read "Lucy Arlyn" and "The Story of Kennett" within a short period of each other, will be likely to notice many points between them both of resemblance and contrast. In our own mind, the thought of one is almost sure to suggest the other. In the first place, they both treat of peculiar phases of American life, of two peculiar religious beliefs, and of narrow localities which these beliefs have stamped with a sharp individuality. Then, both books are written by popular authors who do not handle their unusual materials now for the first time. Mr. Trowbridge has long been accredited as one of the best delineators of New England character, while Mr. Taylor, dwelling in a Quaker community in the heart of Pennsylvania, has opportunities for observation and study of his surroundings which would entitle him to speak of them with the highest authority. Furthermore, in each case the story is of rustic life—arcadian and poetical, yet with a strong admixture of grotesque, absurd, and even tragic elements. Each conceals the denouement of its plot until the end, with equal success, while the plots themselves both turn on the same virtue, woman's patience.

Beyond these respects we do not pretend that the two novels have any connection. "Lucy Arlyn" is much longer than "The Story of Kennett," it is crowded with characters, intricate and elaborate in invention, and, in spite of its fidelity to nature in certain parts, is a thoroughly "sensation" novel, with many of the defects inherent in that kind of literature, while "The Story of Kennett" is simple in plan, moderate in tone, with a more artistic proportion of *dramatis personæ*. But these natural differences are not the contrasts we alluded to; they lie in the manner of treatment of those portions already pointed out as bearing a likeness to each other.

"The Story of Kennett" is laid in the end of the eighteenth century, in the neighborhood of Kennet Square, Pennsylvania. This village contained then, as it does now, a controlling population of the Society of Friends; and, according to Mr. Taylor, an outside class of a liberal sort of people who affiliated with the Friends, and yet belonged neither to them nor to any other denomination, a class which has actually arisen out of the latter-day divisions of Orthodox, Hicksite, and Progressive Friends. The prologue assures us that the reproduction of the manners and customs in Kennet in 1796 is quite genuine. Except for this explanation, and the description of costumes, with certain other outward appearances, we confess we should not have been stirred from this present 1866. It was not so with Judd's "Margaret." There one was torn willy-nilly from the nineteenth century and planted in the eighteenth, so that when he lifted his eyes from the page once more to face the world around him, the reality had become unreal, and the vision of the old time was the only true thing. And yet "The Story of Kennett" does not seem to be a picture of to-day either. Except outwardly, as before, we do not see Kennet. We do not see real Friends. Perhaps we do see *Quakers*. Quakers are the sect beheld from the outside; but the Society of Friends can be known only by the most delicate interior affiliation, by spiritual *rapport*, or by the highest refinement of appreciation. Mr. Taylor's handling of them ever since he first began to weave them into verse or romance has effectually proved him to be one of the "world's people." He sees them externally, perhaps, well enough. He says that they wear drab, have placid faces, and unruffled manners; which is not to be disputed. He knows some of their habits—that they generally sing through their noses in preaching, that they sit with oppressive quietness in their meetings, which they bring to an end by shaking hands, and that their women are educated with a certain peculiar independence. This is also quite correct. But of the main point, that inner life which makes the society the distinctive one that it is, and has given it all the influence it ever had, rendering it worthy the most honorable place in the world's esteem, Mr. Taylor never seems to have any comprehension. He alludes to it, but does not understand it. What admiration and love for Quakers he does possess, we are forced to say has always seemed to us to have been cherished in the way of business—as unique *matériel* for stories, and which he treats with a kind of fondness, as he does the landscape, the different weathers, the birds, and all those things which combine to make a nice picture. In nothing does this lack of appreciation show more than in those passages intended to be humorous. There is a want of delicacy and tenderness about them which a true Friend must feel with an unaccountable resentment, as if some foreign and profane hand were meddling with his Penates. Not that his own sense of fun is not frequently stirred to the depths by the oddities of some of the "dear old Friends" in the gallery, and that he would not relish keenly a close reproduction of the peculiarities which have so stirred his sense of the ridiculous; but he requires that whosoever undertakes the task should have ears to hear more than the mere nasal twang which the minstrels mimic, and eyes to see something besides "drowsiness" and "luxurious satisfaction" beneath the row of broad-brims on the elders' seat. Such a scope as there was for a varied group in that Kennet meeting! And yet Mr. Taylor used only his two unvarying moulds, a better and a worse one, into which he pours all his conception of Quaker character.

The scenes of "Lucy Arlyn" are enacted in a New England village not named, in which there is a small band of "spiritualists" daily adding more and more to their numbers. The descriptions of the meetings and "circles" of this sect are as vivacious and vivid as may be. It is impossible to read them without being moved in some sort. The majority of people will, of course, cry out at their heresy. Those who have never seen any "manifestations" will set down the whole as pure fabrication—characters unnatural—occurrences impossible. Those who are not without some similar experi-

* "Lucy Arlyn. By J. T. Trowbridge." Boston: Ticknor & Fields. 1866. Pp. 364.

"The Story of Kennett. By Bayard Taylor." G. P. Putnam; Hurd & Houghton, New York. Pp. 418.

ences will marvel at the power which has made the page glow with life, even though they may differ in the conclusions which the author has drawn. Mr. Trowbridge exhibits all sides of the picture with the confidence and power of one who has not only seen but felt what he is talking about, and we are forced to recognize with alternate laughter and wonder his Murk, and Archy, the Burbles, and Miss Lingham, and, indeed, almost every member of the "circles," despite some blemishes of high coloring and occasional inconsistencies. It must also be added, in discrimination, that the comical aspects of the system supported by "Lucy Arlyn" are given with more ability and certainly more agreeableness than the serious ones; for, while in the former the author is master of his subject, in the latter it is master of him, and, although he draws with ever so much fidelity the immense and awful side of the mystery which rises up before him, he injures it by failing to resist the temptation of presenting the reader with his inferences along with his facts, and thus creating a general confusion between his realities and his doubtful sequences. It is here that Mr. Taylor, if he has not achieved a success, has avoided a danger: the discussion of the doctrines of the religion which colors his story—performance difficult to weave into narrative without the double reproach of being inartistic and irreverent.

Mr. Taylor gives us two practical jokers, Joe and Jake Fairthorn, who, with their young aunt, Sally Fairthorn, do the active jesting, as one may call it, for "The Story of Kennett." It is difficult to refer to these characters with a smile; it was impossible to read of their dull and coarse antics with anything like one. They are utterly dead and cold to all that is funny. The two boys tumble about, get into the mud, play rough and cruel tricks, and do innumerable violent and disagreeable things for which nothing could excuse the chronicling except the power of infusing into them a humor entirely beyond and apart from themselves. Even with that we can scarcely imagine them laughable. Miss Sally Fairthorn's charm seems designed to consist in "boisterousness." She is described as a charming young brunette with endearing impulses, such as kicking her horse, "urging her heavy horse against" a young man in order to snatch a fox's brush from his hat; striking, boxing, and snatching generally amongst the rustic youth of the neighborhood. She catches her clothes on every projection as she rushes wildly about, sometimes tearing them half off her; she tumbles down on the least provocation, and, when he is present, is assisted to arise by a young carpenter who loves her and who takes advantage of these little occasions to put his arm around her waist. Miss Betsy Lavender is a degree better than the rest of the "comic cast," but she is only very rarely and very feebly amusing.

Now there *is* such a thing as low comedy, and we have even heard *coarse* jokes that, spite of disapproval, we were obliged to laugh at. Mr. Trowbridge gives us some very rough humor, but humor it is, of the genuine ring. Compare Archy's lamentable adventure with the "bunting corset" with any of the Fairthorn performances; yet the Fairthorns are perpetually "shrieking with laughter," while Archy is generally in a state of woe. Recall the philosopher Murk by the brookside "impressed" that he would be invited to breakfast on the trout his own conscience would not allow him to catch. Recall the same sublime ward, as you may dub him, of Socrates and Swedenborg, operating unbidden on the paralyzed legs of the helpless and indignant colonel, while Dr. Biddikin near by rises on his toes, joins his thumbs, and talks about "invisible intelligences." Recall the whole of the first "spiritual circle," Archy's astonishment at "jerking," Ann Mari' and her mother with their questions to the spirits: "Swedenborg, be you here?" etc., etc. These and other scenes are so rich in laughter-provoking qualities that we can afford to forget, if not to forgive, the whole Biddikin underplot, which is violent and painful, as it is theatrical and distorted.

Narrowing space forbids us to carry the parallel further than a few brief words in conclusion. If we were forced to find the distinguished traveller somewhat soporific, and to question if novel-writing were his true vocation; if, since he draws from life, as the prologue tells us, we are not to cavil at the truth of his sketches, and may only wonder why a history so singularly unlovely as that of Mary Potter and Alfred Barton was presented for the delectation of the public,—we cannot condemn him for the monstrous faults of which "Lucy Arlyn" must stand accused. Mr. Trowbridge permits his hero to neglect his wife and child, to become involved with another woman in a sort of "spiritual" flirtation—which he justifies him in concealing from his wife because "women never understand such things"—and to ignore common sense and common virtue in various ways, for the sake of pursuing his "spiritual" investigations; finally restoring him to his wife not only still in the character of a hero, but of one exalted by great experiences and fitted to teach others, instead of a penitent, humbled and enlightened. If Mr. Trowbridge proves that an earnest seeker after the truths of "spiritualism" may innocently do those things which would warrant the charge of moral obliquity in another man, he deals a heavier blow at his system than any of its enemies could. For the general reader, then, his book, being of doubtful tendency, can scarcely be recommended. For whoever would study American, and particularly New England, society and character, it has an unquestionable historical value. No corresponding worth, we apprehend with all deference, can be ascribed to "The Story of Kennett," which, for the rest, is to "Lucy Arlyn" as the material to the unspiritual.

DRAPER'S CHEMISTRY.*

THIS is an enlargement of the manual published by Dr. J. W. Draper in 1846, a manual which "satisfied so completely the public wants that it passed through more than forty editions." It can hardly be doubted that the enterprise of the publishers will give a like success to this new edition. The book is of convenient shape and size, is profusely, though coarsely, illustrated, contains as much physics, besides as much chemistry, as medical students and other smatterers expect to learn, and is provided at the bottom of each page with a series of questions well calculated to reduce to a minimum the amount of thought to be devoted to the subject-matter, whether by teacher or student. In short, the book is a very fair one of its class, and, if anything is to be regretted, it is that American schools and colleges should be content with manuals of chemistry of this description. The objections we make to the book would equally apply to most of the other American text-books on chemistry.

Chemical phenomena and principles often involve and depend upon the laws and facts of physics and the mathematical sciences, but the science of chemistry has its own peculiar laws and phenomena above and beyond the laws and phenomena of the antecedent sciences on which it in part depends, and these peculiar chemical laws and facts it is which form the proper subject of a text-book on chemistry. Dr. Draper has given two-fifths of his book to pure physics, to an exposition of some of the most familiar principles of heat, light, and electricity. If he had placed a few chapters on arithmetic and geometry at the beginning of his book he would only have begun a little further away from his proper subject, and the book would have been still more convenient for those students who have no knowledge of the elements of the sciences whose principles are necessarily assumed in the study of chemistry. "Text-book on chemistry" is a misnomer for a book which is two-fifths physics.

The evils of this unseasonable association of physics with chemistry appear very strikingly in the lecture on the laws of combination. We are told that "it has been shown in the first lectures that material substances possess an atomic constitution." Now, in the first place, the proposition that matter is composed of indivisible particles is one which is and always must be incapable of demonstration; and, secondly, the phenomena and experiments explained in the opening lectures are purely physical in their nature, and have nothing whatever to do with the atomic constitution of matter in the chemical acceptation of that phrase. The experiments refer to cohesion and to the expansion or contraction of bodies under the influence of heat or pressure. But Dr. Draper proceeds:

"*It follows, therefore* [that], when substances combine with each other and give rise to new products, the union takes place by the atoms of the one associating themselves with the atoms of the other; and as these atoms possess weight and other properties which are specific, there are certain circumstances, easily foreseen, which must attend such combinations. 1st, The constitution of a compound body must always be fixed and invariable. . . . 2d, The proportions in which bodies are disposed to unite with each other can always be represented by certain numbers; these numbers being, in fact, the relative weights of their atoms. . . . 3d, If two substances unite with each other in more proportions than one, those proportions bear a very simple arithmetical relation to one another."

An inexperienced student would inevitably infer from this statement that the laws of chemical combination followed from the atomic theory, and that the atomic theory had enabled chemists to foresee the circumstances of chemical combination. This is the absolute inversion of the historical and logical order of events. Chemists observed the definiteness and immutability of chemical compounds, and the simple multiple proportions in which such elements as form more than one compound with each other unite, and they subsequently invented the atomic theory to give distinctness and expression to their views of the sensible phenomena. Dr. Draper makes that appear to be antecedent which was consequent, and represents the atomic constitution of matter as a positive fact, from which resulted the fundamental laws of chemical combination, whereas the atomic theory is a mere imagination, incapable of proof, but useful because it en-

* "A Text-Book on Chemistry. By Henry Draper." New York: Harper & Bros. 1866.

ables us better to classify and interpret the phenomena of chemical combination and decomposition. To implant in the student's mind such a misconception of the logic of chemistry on the very threshold of the subject is a grave error.

It is not often that the experiments are so described that an inexperienced student could repeat them without assistance by simply following the directions of the book. Those who believe that chemistry can only be learned tools in hand will find this a serious objection to this text-book. They who hope for the universal introduction of the French system of weights and measures will be sorry to find Fahrenheit's thermometer and English weights and measures used in a new text-book which is likely to have a wide circulation.

The memory of the student will be sufficiently tasked with holding fast the most important facts and best methods of chemistry. An elementary text-book should never contain descriptions of obsolete experiments, antiquated apparatus, or inaccurate methods; nor should it even mention unimportant facts and insignificant details. In the chemical portion of his book we cannot think that Dr. Draper has been always fortunate in the selection of his matter. Thus, why describe at length Thilorier's clumsy and dangerous carbonic acid apparatus when Natterer's condenser has completely superseded it; or why describe the making of hydrogen with potassium when every chemist would use sodium, because the latter metal is five times cheaper? By dwelling on Davy's experiment for the isolation of the obscure metal barium, our author is led into two misstatements, viz., that barium is grey and that its specific gravity is 1·5; the facts being that it is gold-yellow and that its specific gravity is about 4.

The order in which the elements are studied is in many respects most extraordinary. Thus ammonia and the hypothetical metal ammonium are treated of in connection with boron and silicon, substances to which they have not the remotest resemblance. Cadmium, tin, and chromium are discussed together in one lecture, although three more unlike metals, in their chemical aspect, could hardly be selected. Arsenic and antimony are widely separated from their congeners, nitrogen and phosphorus. In short, no attention whatever seems to have been paid to the natural groups into which we are now able to divide the chemical elements.

Dr. Draper not only uses the old dualistic formulæ throughout his book, but he also gives to his students, in the few remarks he makes on the unitary system of notation, an unfair bias against this new method. In the present confused state of chemical nomenclature and symbolic notation, while professional chemists are divided between two opposing systems, we hold that the author of an elementary manual is entirely justified in giving the preference to either system; but that he will do well, whichever system he himself adopts, to explain the other so fully and clearly that his students may be able to read understandingly chemical treatises which are expressed in the symbolic language and notation which is not that of their text-book. A faithful and thorough student of Dr. Draper's book will find, when he has finished it, that he is not in a condition to understand a very important part of the chemical writings of to-day.

Upon the pages of this most elementary manual the name of Draper occurs much more frequently than that of any other philosopher, living or dead. A text-book on the bare elements of a science may, in our opinion, be very properly written without a single citation of authorities, or allusion to the contributions of any particular man or men; but if the names of discoverers and inventors are to be coupled with the mention of their labors and results, if original memoirs are to be occasionally referred to with conspicuous particularity, it is important that due discrimination between great things and little should be observed, and that proper care should be exercised lest the student acquire an altogether distorted view of the relative magnitude of chemical lights. In Dr. Draper's book this care does not seem to have been taken.

Our author sacrifices one out of the fifteen pages devoted to the important subject of animal chemistry to an irrelevant explanation of Prof. J. W. Draper's theory of the circulation of the blood, which is thus stated: "The cause of the circulation of the blood is to be found in the chemical relations of that liquid to the tissues with which it is brought in contact. . . . . The systemic circulation takes place because arterial blood has a high affinity for the tissues, and venous blood little or none." Prof. Draper has a perfect right to hold this speculative opinion, which is a pure hypothesis without a shadow of experimental proof, but our author has no right to say of it that it "is now generally admitted to be true." The contrary is the case. Sharpey and others have demonstrated experimentally that the heart is the *primary* and *sufficient* cause of the circulation of the blood, and this is the opinion almost universally held by physiologists. What shall we say, then, of Dr. Draper's sweeping assertion: "It is now on all hands conceded that this organ [the heart] discharges a subsidiary duty?" It is to be regretted that the introduction into a text-book on chemistry of a page of utterly irrelevant matter should lead our author into such serious misstatements and his many readers into the corresponding errors.

A NEW VERSION OF SOPHOCLES.*

THE biographical essay with which Mr. Plumtre prefaces his translation of the seven great tragedies of Sophocles presents in a modest, attractive way such incidents as are known and knowable in the poet's life. They are few and unimpressive, but they show us, against the background of the lovely Athenian sky, a very noble and beautiful form, splendidly developed by gymnastic training, exquisitely chastened by temperance and purity, and sweetly transfigured by thought. The poet lived in great times, and with us it is thought essential that the events of the time he lives in should appear in the life and works of an earnest man. But in Sophocles the events of his time appear only as sublimated in lofty and serene ideas. He led the chorus of victory in celebration of the battle of Salamis when a youth of fifteen. In the course of his life the greatest social and political revolutions occurred: sacred wars; the Samian war; the Peloponnesian war; the Sicilian expedition, with the destruction of the Athenian army and navy; the Council of the Four Hundred, of which he was a member; the banishment and the recall of Alcibiades; Socrates was born; Æschylus was at the height of his fame; Pericles rose to his full glory; Athens was devastated by plague and torn by political convulsions. Ever and anon the form of the poet is seen towering up as general or as counsellor, but his genius remained unseared by the heat of the conflict and unstained by the smoke. His plays bear scarcely a trace of the fierce disorders or of the fitful glory that marked the epoch of his long career. The critic's search for political allusions is almost wholly in vain. Even such outward occurrences as the plague at Athens, which caused an awful destruction of human life, pass like mere shadows across his mind. Yet his plays could have been written only when they were. His age is in them, but the incidental part, the personal strife, the partizan bitterness, the local rage, are all strained out and we have nothing but the sublime faith, hope, and love of a great soul sweetened by sorrow and humbled by meditation. This imparts to the tragedies of Sophocles their undying charm. These plays are eternal. To read them is like bathing in cool waters at midsummer's noon; it is like walking in shady groves melodious with the songs of birds; it is like sitting in the company of serene ideas clothed in translucent forms. The firmness of the thought, the calmness of the judgment, the depth of the reflection, the perfect balance and ease of the intellectual movement, the exquisite art which allows no indistinct or needless word, exercise, all combined, a fascination not over the mind alone, but over the heart, help to exalt our ideas and make them palpable at the same time.

Mr. Plumtre's translation deserves great praise. We have not examined it minutely, but we have taken it up at some of the most familiar passages and found it accurate, easy, dignified, and poetical. It is done in blank-verse, simply and unpretendingly; the language is well chosen, so as to be clear and intelligible to the reader while preserving as much as possible of the quiet antique cast which befits the old tragedies. No scholastic notes encumber the pages; no pedantry obtrudes itself between us and the poet. The version is left to attest on its own part the faithful scholarship of the translator and the loving spirit in which his task has been performed. The volumes are beautiful specimens of the book-maker's art.

THE NORTH AMERICAN REVIEW FOR APRIL.

THE number of the "Review" before us is, it may be safely said, the best that has ever appeared. Whether a better one can, with the materials at the command of the editor, be produced for a long time to come may fairly be questioned. The only fault we feel tempted to find with the "Review" in general is that it is apt to contain, as it seems to us, a superabundance of what may be called purely narrative articles, such as "Our Diplomacy during the Rebellion" and "International Arbitration"—articles which owe their value almost entirely to their skilful and accurate arrangement of facts with which the public is already tolerably familiar. We are far from doubting the value of articles of this kind; but a review should, we think, aim, as far as possible, at supplying either the philosophy of subjects, or facts in relation to them which the mass of readers cannot readily find elsewhere. We do not mean to say that any quarterly has ever come up to this standard, but we feel satisfied that all quarterlies which fall short of it fail, *pro tanto*, to perform their proper function.

* "The Tragedies of Sophocles. A New Translation, with a Biographical Essay. By E. H. Plumtre, M.A." 2 vols. Alexander Strahan, London and New York.

"The Error of De Tocqueville" points out the extent to which De Tocqueville's views of the impossibility of coercing into obedience to Federal authority any State which chose to resist, affected European opinion of the events of the late struggle. De Tocqueville's mistake is, of course, now patent; but the reasoning which led to it was sound enough. The error which crept into his conclusion was due to his ignorance of the character of the people, an ignorance which in him was excusable, inasmuch as a great number of Americans shared it, as was seen at the outbreak of the war.

The article on "Military and Martial Law" distinguishes between two codes which are often confounded. The latter is defined by the writer to be "the will of the commanding general, exercised in accordance with the laws of war and the usages of civilized warfare." To it belong military commissions, as distinguished from courts-martial, the extreme extension of whose jurisdiction, though pardonable in the extraordinary exigencies of the late rebellion, was injurious to civil liberty, and will be still more so if it comes to be cited as a precedent in the law of nations. Nevertheless, the writer believes that history will give a general approval to the acts of our Government in its desperate strait, and will wonder at the moderation with which it exercised that vague and formidable authority, "the war power." The contradictory functions of the judge-advocate are very forcibly set forth and the appointment of a military judge recommended. The power vested in the President of dismissing with disgrace any officer without a trial, although it has been confirmed by Congress, is deprecated by the writer as involving much injustice and being discordant with the whole system of military law. The question, we would suggest, is akin to that of removing civil officers in the same summary manner, whereas they also were appointed not simply by the President but by the Senate in concurrence. One of the most useful checks upon the patronage of the Executive would be to oblige him to give his reasons for revoking his own nominations and to solicit the necessary permission.

Under the heading "Character," Mr. Emerson invites us to read about nature and spirit, morals and religion, ecclesiasticism and theology, Judaism and Christianity and Paganism, the English religion and the American religion, and many other things besides pertaining to the condition of the world at large. With him all these things have their root in character. "Character is the habit of action from the permanent vision of truth." "There is no end to its sufficiency." "Whenever the sublimities of character shall be incarnated in a man, we may rely that awe and love and insatiable curiosity will follow his steps." "The moral sentiment puts us at the heart of nature." The essay reminded us all through of the wonderful address delivered before the senior class of the Cambridge Divinity School, in 1838. It is less poetical and imaginative than that, less spontaneous and intuitive; it is the work of the scholar who has read many books and the thinker who has tested many theories, rather than of the youthful seer whose eye followed the flight of ethereal principles. But the thoughts are essentially the same. Observation, reflection, experience, toil, confirm the prophecy of the young enthusiast. The conservatism which is supposed to be inevitable in man after forty appears at its minimum in one or two sentences like these: "We must have days, and temples, and teachers;" "the Sunday is the core of our civilization." Those who have apprehended that Mr. Emerson, in his late studies of scientific books, had been falling away a little from his high faith in the immutable verities of the human conscience and spirit, may feel entirely re-assured by this most recent expression of his thought. More deliberate statement of the transcendental philosophy on its moral side has never been made. The merit of the essay, in a philosophical point of view, is far greater than it will appear to a casual reader. Worlds of reading and speculation are packed away in these fine, incisive sentences, consisting of a few short English words. The meaning lies deep, layer on layer, and the deepest meaning is the most spiritual; the intellectual discernment is keen; the moral discernment is surpassingly far-reaching.

"The New York Herald," by Mr. Parton, is very interesting, but the concluding portion hardly fulfils the promise of the opening. The early struggles of "James Gordon Bennett, Editor and Proprietor," are ably sketched, and Mr. Parton's analysis of that distinguished person's character is an excellent lesson in morbid anatomy. The conclusion he draws from Bennett's course is not novel, but is well put, namely, that success in journalism in this country is only to be achieved by the supply of accurate and early news; and that any editor who does this well, may snap his fingers at the public and the moral law, and feel sure of being able to live like a duke. We should, however, have liked a more detailed account of the various outrages on decency committed by the *Herald*, partly from pure curiosity and partly as an interesting contribution to the study of human nature.

In "Dante and his Latest English Translators" we have an interesting review of the efforts which have been made to render the "Divina Commedia" into our own language, from Milton's version of three or four lines to Dayman, Ford, Rossetti, and Parsons's more or less complete translations, of last year. Mr. Rossetti and Mr. Parsons seem to have pleased the reviewer most, who, while admiring the ingenuity displayed by Dayman and Ford in their triple rhyme, expresses his very decided opinion that the undertaking is futile because of the constraints of a measure to which our tongue cannot bend. The triple rhyme, according to the list on page 519, was first attempted in 1843, and, spite of its undeniable difficulties, has found no less than seven adherents. We do not gather, however, that any of these went so far as to preserve the with one or two exceptions invariable female rhyme of the original, of which the following (Inf. XV., vv. 43–51) may be taken as a specimen:

> "I had not courage, from the path descending,
> To walk beside him, but my head I lowered,
> Like a man reverently his journey wending.
> 'What fortune,' quo'th he, 'or what fate untoward
> Netherward hath brought thee, ere thy summons sounded?
> Or who to keep the way hath thee empowered?'
> 'Above ground,' answered I, 'while naught confounded
> My tranquil life, I wandered in a valley,
> Before the fulness of my age was rounded.' . . ."

"Carlyle's Frederick the Great" is not so much a review of the book as an analysis of the author's character, and is the ablest attempt to furnish the rationale of Carlylism we remember to have seen. "The President on the Stump" is a keen and brilliant criticism of the President's recent public performances, and incidentally of his policy of reconstruction. The speech put in Mr. Johnson's mouth at the close, as the one he *ought* to have delivered to the first Southern deputation which waited on him, is a masterpiece in its way. The whole number is one of extraordinary interest and excellence. The literary notices are still better than the essays; one or two of them—such as that on Swinburne's "Tragedies," Bushnell's "Vicarious Sacrifice," and Higginson's "Epictetus"—have never, we believe, been surpassed in this country as pieces of critical writing.

The Border Rifles. By Gustave Aimard. T. B. Peterson & Bros., Philadelphia. (F. A. Brady, New York.)

Fine Arts.

WHAT IS ART CRITICISM?

There is much writing about art which is not criticism, and is nevertheless called by that name. Of this there have been several forms to be seen in American periodicals, succeeding each other after a fashion, but not wholly independent of each other; in fact, rather confused with each other. It will be well to name these forms of non-critical writing upon art. The primeval newspaper notice—which announced that so-and-so had painted a remarkably fine picture and had invited the editor to see it, and which was followed by the announcement that somebody else had raised mammoth strawberries this year and had sent the editor a basketful—was not criticism. The painter and the gardener had each the gratified journalist's best bow; that was all. Everybody understood it who noticed it at all; friendly

interchange of little civilities, but certainly not criticism. The affectionate laudation, unquestioning about relative merit or positive good result, admiring the painter as an "artist" and the picture as a "work of art," was not criticism. It might have answered partly, it might have sufficed to make the necessity for criticism a little less imperative, if it had been accompanied by some love of the things suggested or represented by works of art. In times when painting was natural to man, people were not very critical. Probably Cimabue's compatriots admired him and his works, if without affectation, without discrimination as well, and the "Joyful Quarter" became so without rigid examination into the merits of the picture that caused the joy. But then the people cared a great deal about the subject of that picture and the subjects of all such pictures. Such unquestioning admiration as theirs would be good if we could have it again, but it would not be criticism. The patriotic congratulation which identified two or three painters dead and two or three sculptors living with the glory of America, and glorified them in company with two or three poets, two or three inventors and a novelist, was not criticism. It answered as well as self-praise generally answers, and, being the very reverse of true criticism, has made the need of that criticism even more pressing than it would otherwise have been.

These forms passed away; they were of the primal type; they were succeeded by something that looked like criticism and partook of its nature, namely, discussion of art and works of art according to the principles of this or that school. One writer took this ground, another writer took that; they differed widely in their views of art in general and works of art in particular; they were alike in one thing only, that each looked at all things from an avowed or easily guessed stand-point. This would have answered well enough if only the people had known enough about the matter to judge of the schools themselves. This plan of discussion does answer pretty well in (say) theology and in politics. In all such controversies the speakers or writers are known to occupy such-and-such platforms of principle and are not expected to quit them. But in these controversies the listeners or readers are apt to have such a knowledge of the platforms that they know how to judge the arguments put forth from them. In suits at law there are two speakers occupying very different positions in regard to the argument, each trying to prove something, and it is expected of a very miscellaneous public of a dozen to get at the truth; but then this public has some knowledge of the matter and knows what to expect and what allowances to make. It is not so in matters of art, and therefore there are serious objections to this plan of discussion when applied to questions of art. But, in any case, it is not criticism. It is not the advocates but rather the jury who are critics; the latter, at least, do not take sides to begin with.

Criticism does not take sides, but sees all sides and all opinions with absolute evenness of perception. Criticism must recognize all the contradictory facts and all the apparently irreconcilable data, and must see all with equal clearness. It is the business of criticism to look into the matter, to examine all the facts in order to ascertain the essential facts, and to proclaim these when ascertained. Inasmuch as printed criticism can seldom be exhaustive, except in the case of very important works indeed, a printed criticism of a work of art should occupy the space allowed for it with the statements of those facts concerning that work of art which are the most necessary to state. It may be that a more thorough preliminary examination must have been made before a short paragraph is written —the paragraph being critical in its aim—than before an extended review. The exigencies of the periodical press in most cases forbid extended reviews and call for briefest paragraphs. It seems, then, to be true that there is no case in which "to be sure you're right" is more important than in writing brief critical notices for a weekly or daily journal.

In the case of critical remarks upon pictures and statues, there are many things about which criticism concerns itself—many chances to be wrong or right. If we take any single instance, we shall find that there is much room for both in the consideration of it. There is Mr. Ward's statue, "The Indian Hunter;" we spoke of it briefly when it was first exhibited, six months ago. A complete critical examination of it would involve a knowledge of the established canons of art and of their application in this case; a knowledge of the sculpture of the human form that already exists in the world, and of the condition under which it has all been produced, for only so can the importance and merit of this sculpture be rightly judged; a knowledge of the external aspect of the human body, of the peculiarities of race which distinguish red men from other races of mankind, and of the relative importance of these peculiarities to the central type; a knowledge of the way of representing in art the abstraction of the form of the human body; a knowledge of the nature of the process of modelling, and so on—it would be hard to make the enumeration logical, and harder to make it complete. And even accurate knowledge of one point does not suffice. The requirements of criticism are vastly more general than the requirements of production, besides being very different from them. It will help judgment very little to be able to pronounce positively upon the truth of modelling of a knee or a wrist—very little, to be sure whether it is a true Sioux or Blackfoot face.

It is pleasant to see, at the stage of development in respect to art which we have reached in America, the question often repeated, "Who is competent to be an art critic?" The question is asked with different motives. Very varying answers would be given if each one who asked were to answer it for himself. It is perhaps asked oftenest by aggrieved artists who feel sure that the writer who has found fault with them cannot be a competent art critic. But whatever prompts the question, it is a good question to ask; it is practical; something will come of it. People who have such a question in their minds will not be so easily dazzled by any elegance or vivacity of style, or so taken up with side issues as to lose sight of the main thing, the essential drift of the criticism.

The question in quotation marks above formed the title of a letter to the *Evening Post* not long ago, signed "Frank Esten." "Who can be art critic?" was the title of another communication to the same journal, in answer to the former, and signed "E. S." We mention these as the latest published remarks upon the subject that we have seen. And before going on to discuss further the matter they treat of and the questions they ask, we mention another contemporary essayist to whose words we may have to refer. Mr. Philip Gilbert Hamerton, an English painter who has written much and with very unequal success on many subjects connected with painting, has begun the publication in the *Art Journal* of a series of papers entitled "Liber Memorialis," from two numbers of which we have learned to anticipate for the completed work a value far beyond anything else that he has published.

We shall not disagree with these writers in respect to the qualification they desire for a critic. The article signed "Frank Esten," if we understand it aright, limits itself to the discussion of external physical forms of art only, and asserts that art critics ought to be educated in these. A safe assertion! We shall differ from the author only in regard to the way to gain the requisite knowledge, and in our objection to his singularly inaccurate, uncritical language, capable as it is of many interpretations. Thus, in the discussion of outline and of "color without light," the words are capable of several meanings, and what the author thought upon these matters the reader strives in vain to discover. We mention this only that we may call attention to one of the requirements in criticism—accurate knowledge of your meaning and power to express it accurately. The paper signed "E. S." considers art from the side of sentiment and thought, and demands the consideration of these in every judgment of works of art. It shows an unusually clear understanding of this little-understood matter, and we regret that we can make no guess as to the authorship of it. But there is one fact toward which both these letters point—which merits and shortcomings alike make clear—that the duty of the art critic for many a year to come must be to teach the principles of that art which appeals to the eye. There is not a line in either letter which does not tend to show that painting and sculpture, the arts, under whatever name, that deal with form and color, are exotics. They are hot-house plants, not natives of other climes alone, but left from other times—fern-trees kept alive from that carboniferous epoch when they grew out of doors. Some men cultivate them because they love them, some because they think it a pleasant thing to have the reputation which the care of them gives; and there is naturally a good deal of difference between the results. There is a great difference between painter and painter. But, great as it is, there is a yet greater difference between the condition of painting now and as it has been.

To instruct the ignorant of art, to interest the careless of art, and especially to guide the enquirer concerning art, seem to us the great objects of art criticism at the present time. The discussion of individual works of art is likely to help in attaining those objects. It is mainly with that view that The Nation undertakes the critical discussion of pictures and statues on exhibition, and would discuss buildings erected if these were not so rarely works of fine art. The thought and feeling of our times find expression in music and in verse far more easily and naturally than in form and color; this, perhaps, we ought not to regret; but, as there is a tendency to return somewhat to those good old ways of expressing thought and feeling, there is need of such examination of their capacities and limitations, such estimate of the more and less favorable manifestations of this tendency, as will help along the needed *renaissance*.

Whatever is to be done for art, whether much or little, the artists have the most important part of it to do. For instance, in the matter of landscape painting, the most successfully practised art of all the fine arts in

America, but which is still in its infancy, more is to be gained by the exhibition of a landscape of great merit than by the cleverest writing about the matter of landscape painting. But, the exhibition of good pictures being given, interpretation is at once needed for the people unused to such a spectacle. And, the exhibition of a few good and many valueless pictures being given, as is usual, interpretation is needed for the people *too* used to the spectacle. We want to help in the revival of art from the dry bones of the recent past, and to interest in it the world of intelligent people who now never look that way. The picture galleries afford a means of doing so.

Such, then, being the requirements upon art criticism, the best art critic is he who can best meet them, or who can adequately meet the most of them. Your student of the history of art may not be anything of a critic; make him a diligent student of nature, and he approaches it; teach him drawing, and you help him wonderfully; give him large views and general cultivation, and he is near it; bestow imagination upon him, and he is something of a critic; and, after that, the more experience and knowledge of men and purity of heart and practical skill in processes of art you give him, the better critic is he. The mistake into which many persons fall, with "Frank Esten," is in supposing the knowledge of aspects and of processes the one thing needful. It is just such a mistake as if they should consider imagination or historical knowledge the one requirement. Ruskin, having studied external nature eight hours a day half his life, and having made himself one of the first landscape draughtsmen of the time, is a better critic because of these things; but if there were question whether to take this from him or his imagination, those who value him as a critic should let the former go and keep the latter.

As few men besides painters are able to give their lives to recording aspects of nature, the painter's opinions of any picture are, and must always be, of great importance. A careful landscape painter's remark, made in earnest, upon another man's landscape, should be heeded and treasured up, particularly if he speaks of truth of representation. Mr. Hamerton is turning his attention to the recording and explaining in words, with wood-cut illustrations, some of the phenomena he sees in nature; it is probable that he will never do anything more useful. But it is seldom the mission of artists to be critical—a critical artist has seldom been seen, and if any one reason were wanted for it this one would answer: they of necessity draw their conclusions from too few and too strongly felt premises. They are greater and more important than the critics, and they have a much more delightful occupation than the critics—or, perhaps, anybody else; it is their business, moreover, to teach the critics, who, in their turn, have to try to impart some of the teachings to the outside and indifferent world.

Science.

SCIENTIFIC NOTES.

The Progress of Chemistry in 1865.—The "Bulletin de la Société Chimique de Paris" contains, besides the memoirs read before that society, tolerably complete abstracts of all the chief chemical investigations which are published in Europe and America, and notices of all chemical discoveries and facts of any importance. Its two annual volumes, therefore, present a pretty fair picture of the doings of chemists during the year, and we may learn from them who the working chemists of the day are, and what they have been studying; and we may further get a general notion of the direction in which the science is advancing, and of the number of workers in its several departments. The labors of three hundred and seventy-five chemists in all are cited at more or less length in the two volumes of the "Bulletin" for 1865. The nationalities of these men are very various; France, Germany, England, Switzerland, Austria, Italy, Russia, and the United States are all represented, Germany the most fully, and the United States altogether the most feebly. Only six Americans appear upon the whole list, and of these six four received the greater part of their chemical education abroad. The American contributions are, moreover, insignificant, and of no general scope. That it may not be imagined that this state of affairs is due to the prejudice of foreigners against American productions, it may be well to mention that to the two volumes of the "American Journal of Science" for 1865 only twelve persons contributed papers of a chemical sort, and of these twelve a large portion are rather mineralogists and geologists than chemists. The truth is that there are no positions in this country in which an advanced student of chemistry can find time and opportunity for the prosecution of original researches. The professors in our universities are hard-worked schoolmasters, who are fortunate if they have time and means to acquaint themselves and their pupils with the progress and discoveries of others. Those that grow weary in this harness are apt to turn their attention to some branch of technical chemistry, in which, at least, money is to be made. The evils which result to the community from this state of affairs cannot, however, be conveniently discussed in this connection. About two hundred of the subjects discussed in the pages of the "Bulletin" for 1865 belong to pure organic chemistry, about one hundred and twenty-five subjects relate to pure inorganic chemistry, including in this term mineralogy and analytical chemistry, and about one hundred and fifteen to the applications of chemistry to agriculture, medicine, metallurgy, dyeing and printing, sugar-making, and the various chemical manufactures. It appears, then, that nearly three-quarters of all the investigations here recorded belong to the domain of pure science; their immediate motive and direct effect is to advance and extend the science of chemistry, not to improve an art or manufacture. Of what the indirect effect of these researches upon the useful arts may or may not be, no man who remembers the time when aniline was a chemical curiosity will speak with much confidence. It is to be observed that organic chemistry seems to be the most attractive field for enterprising and ambitious students. This is because this branch of the subject has been the least studied, new principles and new substances lie nearer at hand, and any industrious explorer may find on the confines of the territory plenty of surface-ore which will yield even to the hasty and inexperienced seeker some grains of truth. A majority of the young students who do so much of the task-work of the science choose organic rather than inorganic chemistry, and they work under the lead and inspiration of a few very able men who have exclusively devoted themselves to this branch of chemistry, such as Hofmann in Berlin, Würtz in Paris, Williamson in London, Kolbe in Leipzig, and Kekulè in Ghent. These men and their associates and followers have so developed and magnified the chemistry of the combination of carbon, for this is the best definition of organic chemistry, that to a new student the principles and methods applicable to this branch of the subject seem to be the master principles, and the best methods of all chemistry, and the nomenclature best suited to the clear statement of the facts of organic chemistry seems to be the only nomenclature which can by any possibility be useful in the general science. But it is to be noticed that inorganic and technical chemistry together still claim and receive the larger share of the time and attention of working chemists; and so long as this is the case we need not fear that the theories and notation of organic chemistry will have any undue influence upon the development of the general science.

Acetylene.—Berthelot has lately demonstrated the formation of acetylene ($C_4 H_2$) during incomplete combustion of hydrocarbons. A very simple experiment will demonstrate this for gases or volatile liquids. Fill a glass tube of about 300 cubic centimetres capacity with any gaseous hydrocarbon, like ethylene or marsh-gas, for example, or pour into the tube a few drops of a liquid hydrocarbon, like ether, benzine, or acetone; then add a few centimetre cubes of the ammoniacal chloride of copper, inflame the combustible vapor, and hold the tube almost horizontally, turning it between the fingers so as to spread the cupreous reagent over the inside of the tube; there will immediately appear the red cupreous precipitate which characterizes acetylene. This experiment is an excellent lecture experiment, especially brilliant with ether. Berthelot has before demonstrated the formation of acetylene when organic compounds are exposed for a long time to a red heat, but he declares that the amount of acetylene formed by this new method of incomplete combustion is much greater than that formed from the same compounds by heat alone, and thinks it possible that a new method of preparing acetylene, more advantageous than any now known, may be based upon his observations. But not only is acetylene produced by the combustion of hydrocarbons in partially closed vessels; it is always formed when an organic compound burns in the air with a sooty flame. Berthelot procured acetylene from the imperfect, or smoky, combustion of coal-gas, benzine, turpentine, petroleum, and other less familiar hydrocarbons. These observations explain in part the peculiar smell often perceptible in a room lighted by gas. The acetylene thus carried into the air has fortunately no poisonous effect in itself, but its presence is a sign of incomplete combustion, and such imperfect combustion may generate a gas which is pre-eminently poisonous, the oxide of carbon. This formation of acetylene is, furthermore, not without an important bearing on the general theory of combustion. The hydrogen of hydrocarbons has been supposed to burn first, leaving the carbon free and incandescent. But if, as Berthelot asserts, naphthaline ($C_{20} H_8$) generates acetylene ($C_4 H_2$) in burning, it must be that a part at least of the naphthaline loses its carbon before its hydrogen. $C_{20} H_8 - {}_4 C_4 H_2 + C^4$. In reality, the combustion of hydrocarbons does not take place by a single decomposition, but by a series of decompositions. Berthelot's investigation adds acetylene to the intermediate substances already known

to be formed during the decomposition of hydrocarbons into the carbonic acid and water which are the ultimate products of their combustion.

LEYPOLDT & HOLT'S

AMERICAN AND EUROPEAN LITERARY BULLETIN,

A MONTHLY LIST

Of the most prominent English, French, and German Publications, with occasional notes on Dutch, Danish, Swedish, Italian, Spanish, Portuguese, and other Foreign Books.

Sent for one year, post-paid, to any address, on receipt of 25 cts.

PUBLISHERS AND IMPORTERS, 646 BROADWAY, NEW YORK.

At 451 Broome Street after May 1st.

THE NEW MAGAZINE.

NOW READY AND FOR SALE BY ALL NEWSDEALERS,

THE GALAXY.

AN ILLUSTRATED MAGAZINE OF ENTERTAINING READING,

PUBLISHED FORTNIGHTLY. PRICE 25 CENTS.

CONTENTS:

I.—THE CLAVERINGS. By Anthony Trollope. (With an Illustration.)
Chapter I.—Julia Barabazon.
II.—Harry Clavering Chooses his Profession.
III.—Lord Ongar.
II.—GIANTS, DWARFS, AND FAIRIES.
III.—CHILDE HARROLD.
IV.—A CHAPTER FROM A NOBLE LIFE.
V.—ARCHIE LOVELL. By Mrs. Edwards.
Chapter I.—A Vampire Brood.
II.—The Hon. Frederick Lovell.
III.—Brune Aux Yeux Bleues.
VI.—SPRING—1866. (With an Illustration by Darley.)
VII.—A WINTER WITH THE AMERICAN PERIPATETICS.
VIII.—JOHN RYLAND'S WIFE.
IX.—NEBULÆ.
Private Theatricals.
The Rebuilding of Paris.
Quaker Dress.
New Parisian Styles in Ladies' Boots.
The Glove Trade.
The World's Fair Building.
The Prince Imperial.

The opening illustration, by Mr. Darley, is one of the best from the pencil of that artist. The other full-page illustration is copied from a design by a distinguished English artist. Both of these illustrations are handsomely printed on tinted paper.

The GALAXY *may be ordered for any length of time desired*, at the rate of twenty-five cents a number, in advance.

It will always be sent to subscribers *postage paid*.

Specimen copies sent on receipt of twenty-five cents. Address

THE GALAXY,

39 Park Row, New York.

WILL BE PUBLISHED MONDAY, APRIL 16th,

THE

BOOK OF ROSES,

By FRANCIS PARKMAN.

CONTENTS:

OPEN-AIR CULTURE; POT CULTURE;
PROPAGATION; MISCELLANEOUS OPERATIONS;
GROUPS AND FAMILIES; SUMMER ROSES;
AUTUMNAL ROSES.

With a List of Roses most approved by the best cultivators of the present day, and a List of the New Roses of 1866.

Elegantly illustrated and beautifully printed on tinted paper. Muslin extra, $3 00.

J. E. TILTON & CO.,

Boston, Publishers.

Our illustrated Catalogue sent by mail, free, on receipt of stamp for return post.

CONVENTION CHORUS BOOK.

A collection of ANTHEMS, CHORUSES, GLEES, and CONCERTED PIECES, for the use of Musical Conventions, Choral Societies, etc. The object of this work is to furnish at a very low price the best pieces of music of the classes above enumerated, being those generally selected by Musical Societies, Choirs, and others for practice. It contains 14 Sacred and 17 Secular pieces from Oratorios, Operas, etc., and is, without exception, the cheapest book of the kind ever published. Price 60 cents. Mailed free on receipt of price.

DITSON & CO.,

Publishers, Boston.

S T R A H A N & C O.,

178 GRAND STREET,

HAVE JUST PUBLISHED:

HOW TO STUDY THE NEW TESTAMENT.—THE GOSPELS.—THE ACTS OF THE APOSTLES. By Henry Alford, D.D., Dean of Canterbury. In small 8vo, vellum cloth, $2.

SIX MONTHS AMONG THE CHARITIES OF EUROPE. By John De Liefde. 2 vols. post 8vo, with 44 illustrations, $6.

PROFESSOR PLUMTRE'S NEW TRANSLATION OF THE TRAGEDIES OF SOPHOCLES, with a Biographical Essay. 2 vols. crown 8vo, $5.

THEOLOGY AND LIFE: Sermons chiefly on Special Occasions. By E. H. Plumtre, M.A., Professor of Theology, King's College, London. Small 8vo, $2.

SERMONS AND EXPOSITIONS. By the late John Robertson, D.D., Glasgow Cathedral, with Memoir of the Author, by J. G. Young, Monifreth. Post 8vo, $3.

THE PARABLES OF OUR LORD. By Thomas Guthrie, D.D. With illustrations by J. E. Millais, R.A. Square 8vo, $2 50.

THE WORKMAN AND THE FRANCHISE.—CHAPTERS FROM ENGLISH HISTORY ON THE REPRESENTATION AND EDUCATION OF THE PEOPLE. By F. D. Maurice, M.A., President of the Working-men's College, London. Demy 8vo, $3.

CITOYENNE JACQUELINE: A Woman's Lot in the Great French Revolution. By Sarah Tytler, author of "Papers for Thoughtful Girls." Crown 8vo, $2 50.

GOD'S GLORY IN THE HEAVENS: A Survey of Recent Astronomical Discovery and Speculation, in connection with the religious questions to which they give rise. By Rev. William Leitch, D.D., late Principal and Primarius Professor of Theology, King's College, Canada. New Edition, with 32 illustrations. Crown 8vo, $2 50.

PERSONAL NAMES IN THE BIBLE, Interpreted and Illustrated. By W. F. Wilkinson, M.A, Vicar of St. Werburgh, Derby, joint editor of Webster & Wilkinson's Greek Testament. New edition. Small 8vo, $2.

THE FOUNDATIONS OF OUR FAITH: Ten Papers read before a mixed audience of men. By Professors Auberlen, Gess, and others. New edition. Crown 8vo, $2 50.

OUTLINES OF THEOLOGY. By the late Alexander Vinet. New edition. Post 8vo, $3 75.

TANGLED TALK: An Essayist's Holiday. By Henry Holbeach. Post 8vo, $2 50.

HENRY HOLBEACH, Student in Life and Philosophy; with controversial letters to Matthew Arnold, Alexander Bain, Thomas Carlyle, Arthur Helps, G. H. Lewes, H. L. Mansell, F. D. Maurice, John Stuart Mill, Dr. John H. Newman, and others. 2 vols. post 8vo, $5 50.

STRAHAN & CO.

WILL SHORTLY PUBLISH:

FAMILIAR LECTURES ON SCIENTIFIC SUBJECTS. By Sir John F. W. Herschel. Small 8vo.

THE RESOURCES AND PROSPECTS OF AMERICA. Ascertained during a Visit to the States in the Autumn of 1865. By Sir S. Morton Peto. Crown 8vo.

DAYS OF YORE. By Sarah Tytler, author of "Citoyenne Jacqueline." 2 vols.

WEALTH AND WELFARE. By Jeremiah Gotthelf. 2 vols. post 8vo.

LONDON POEMS. By Robert Buchanan, author of "Idyls and Legends of Inverburn."

THE STORY OF DAVID GRAY. By Robert Buchanan.

FAMILY PRAYERS for the Christian Year. By Henry Alford, D.D., Dean of Canterbury.

ESSAYS by Dora Greenwell, author of "The Patience of Hope." Small 8vo.

THE CHARACTERISTICS OF CHRIST'S TEACHING. By C. J. Vaughan, D.D., Vicar of Doncaster. Small 8vo.

Strahan & Co.'s Publications can be obtained of all respectable booksellers, or mailed free on receipt of published prices at 178 Grand Street, New York.

☞ Removing in May to 139 Grand Street.

BOHN'S LIBRARY SERIES.

NEW VOLUMES

OF PERMANENT VALUE JUST ADDED TO THIS STANDARD COLLECTION.

1.

BOHN'S SCIENTIFIC LIBRARY.

CLARK'S HERALDRY;

An Introduction to Heraldry. With nearly one thousand Illustrations; including the Arms of about Five Hundred different Families. By Hugh Clark. Eighteenth edition. Revised and corrected by J. R. Planché, Rouge-Croix Pursuivant of Arms. Post 8vo, cloth, $2 25.

2.

BOHN'S ILLUSTRATED LIBRARY.

FLAXMAN'S Lectures on Sculpture, as delivered by him before the Royal Academy. New Edition, with a brief Memoir of the Author, and an unpublished Introductory Lecture, and two Orations on Canova and Banks, with 53 Plates. 12mo, cloth, $3.

3.

BOHN'S STANDARD LIBRARY.

THE FRIEND;

A Series of Essays to aid in the Formation of Fixed Principles in Politics, Morals, and Religion. With Literary Amusements interspersed. By Samuel Taylor Coleridge. New Edition, with Portrait. Price $1 75.

SCRIBNER & CO.,

FOREIGN BOOKSELLERS AND IMPORTERS,

124 GRAND STREET, NEW YORK.

Catalogues of the Complete Collection may be had gratis, and any of the volumes sent postage paid upon receipt of Catalogue Price by SCRIBNER & Co. Special attention is directed to the fact that a *large reduction* has recently been made in the prices of this Series, rendering them the cheapest standard books in the American market.

CULTIVATION OF THE GRAPE.

BY W. C. STRONG.

This will be a complete manual of Grape Culture for every part of the country, including all recent improvements in forcing, grafting, training, etc., with directions for preserving the natural fruit in its original freshness, out of season.

WITH ILLUSTRATIONS.

TICKNOR & FIELDS, Boston,

PUBLISH THIS DAY,

ASPHODEL:

A ROMANCE.

1 volume 16mo, $1 50.

"Asphodel" is a genuine romance, written in an original vein of great purity of feeling, and portrays special character with peculiar poetic fidelity. The story is American in all its situations and experiences, and has that power of interesting the reader which cannot be resisted.

THE QUEEN MOTHER AND ROSAMOND.

BY ALGERNON CHARLES SWINBURNE.

1 vol. 16mo, bevelled boards, gilt, $2.

The author of "Atalanta in Calydon" has won to himself the applause of two continents already by his poetic genius. At a single bound he has placed himself in the front rank of modern poets, and the volume now first reprinted in America will amply sustain his reputation. It is replete with those vivid and original bursts of poetic fervor and fancy that stamp the writer as a man of genius, sure of his ground, and able to sustain himself in whatever region he may essay to soar. "The Queen Mother" and "Rosamond" are no less marked productions than "Atalanta" or "Chastelard."

THE SOUTH SINCE THE WAR.

BY SIDNEY ANDREWS,

Correspondent of the *Boston Advertiser* and *Chicago Tribune*.

1 vol. 16mo, $2.

This book discusses matters of immediate and engrossing interest pertaining to Reconstruction at the South. It is the record of observations made by the author during a journey of several months in a number of the Southern States after the cessation of hostilities. He had every opportunity to note the effect produced upon the people of the South by the complete annihilation of their military power, and to observe the change caused by the reconstruction policy of the President. He was brought in contact with representatives of all classes, from provisional governors to rice negroes, and he gives full accounts of his conversations with various persons with reference to what is called the "negro question." He describes the conventions held in North and South Carolina and Georgia to act upon the policy of the President; the present condition of things at Andersonville, Salisbury, and Florence; scenes in the track of Sherman's army; and the characteristics of social life in the interior of South Carolina and Georgia.

The work is marked by the same fairness and clearness of statement which caused the author's letters from the South to be so extensively copied and so eagerly read.

Sent post-paid on receipt of price.

FINANCIAL REVIEW.

Nation Office, Saturday Evening,
April 14, 1866.

Some small improvement has taken place in general business during the past week. The steadiness and partial improvement in gold and bills have led some merchants to believe that the lowest points have been touched for the present, and hence goods have moved more readily, though there has been no great recovery in prices. Wool is 1½ to 2 cents better than it was a week ago, though still 4 to 5 cents below cost; provisions are rather better; and there is an improved enquiry for breadstuffs at rather higher figures than those which were current a week ago. In the grocery trade no improvement in prices is quoted, but at the quotations goods move more freely than they did. The same is true of hides. In the dry-goods trade, importers complain that even at the decline they can only sell small lots.

Gold improved this week to 128½, closing this evening at 126⅝. The advance was mainly due to the news from Germany. It seems that the threatened hostilities between Austria and Prussia led to a panic on the Frankfort Bourse, and 5-20s were done at a rate equal to 69½ in London. At this price there is a profit of 5 per cent. in gold on their importation, and $1,500,000 are said to be on their way. On this expectation, so many bears in gold closed their "shorts," and so many speculators bought for the rise, that, from being worth ⅛ to 3-16 per cent. a day for delivery, gold was actually lent "flat" on Friday. Exchange felt the effect in the same degree. Before the news of the Frankfort panic arrived, bankers' bills were offered at 106. On Thursday they sold at 107¾, and an advance to 108½ was generally expected. These anticipations were not realized. The highest rates of the week were those of Thursday, and this morning good bills were offered at 107 to 107¼. On reflection, it does not seem likely that the German quarrel can exercise any lasting influence upon our markets. In the first place, it is generally doubted whether the dispute will lead to actual war; and secondly, in the event of war, the first panic over, our securities would be likely to rise in public favor as German stocks declined. As to the importation of 5-20 bonds from Europe, a very simple principle governs the case. Of bonds held in first hands—*i. e.*, in the hands of the bankers who imported them from this country—a considerable proportion may be returned to us for the sake of the profit on the exchange. Of bonds held by investors, few or none will come home. To estimate the quantity of bonds to arrive, therefore, some guess must be formed with regard to the quantity still remaining in first hands in Europe. Nothing positive, of course, can be ascertained on the subject; but German bankers here say that their correspondents have been in the habit of disposing of their bonds quite as fast as they received them, and that the aggregate amount in first hands in London and Frankfort will not exceed a very few millions. Meanwhile, several millions have been sold here to arrive. Should the next advices report an actual outbreak of war in Germany, it would be fair to expect 5-20s to arrive in considerable parcels for two or three weeks to come. Should the war blow over, none would come, and the parties who sold short here, and sent to Europe to buy, might lose money on the operation.

The United States Senate passed the loan bill on Tuesday, and on Thursday it was signed by the President and became a law. Nothing has yet transpired with regard to Mr. McCulloch's policy under the act. He regards it as insufficient, but at the same time expresses to his friends his belief that he can, even with the limited authority conferred upon him, do much towards restoring the currency to a specie standard. His first step will probably be to offer a new loan in exchange for debt certificates, deposit certificates, clearing-house certificates, interest-bearing legal tender, 7.30 notes, and ordinary legal tender. Nearly six months have elapsed since he offered a funding loan, and the market is ripe for a new issue. Opinions differ as to the probable character of the new bonds. Some expect new 5-20s, while others, claiming acquaintance with the private views of the Secretary, are confident that a very long 5 per cent. bond—say 90 years—will be offered to the public. A 90-year 5 per cent. bond would probably sell for par in large amounts. There are many, however, who, in view of the low rate of interest paid by Great Britain on her debt, would consider 5 per cent. too much for the United States to pay for a bond running for three generations. In view of the prospect, bankers and dealers in Governments are prepared to be beforehand with the Secretary, and have already bid up 7.30 notes to 100¾, and compound-interest notes to within ¾ to 1 per cent. of their nominal face value. Fortunately for the Government, Mr. McCulloch is at liberty to sell his bonds when, and as, and at the prices he pleases. Thus, if a combination of speculators bid up this or that class of securities in order to extort money from him, he may decline to receive such securities in payment of loans except at such a price as he may deem reasonable. He might, for instance, offer $100,000,000 of bonds in exchange for ordinary legal tender and debt or deposit certificates; the effect would be to bring down the price of 7-30 notes and compound legal tenders, and at the decline he might fund them at fair rates.

The following table will show the course of the stock, gold, exchange, and money markets during the past week:

	April 7.	April 14.	Advance.	Decline.
United States Sixes of 1881	104¾	104⅞	⅛	....
5-20 Bonds, old	104	103¾	...	¼
5-20 Bonds of 1865	104	103⅞	....	⅛
10-40 Bonds	91½	92	½	....
7.30 Notes, second series	99⅞	100¾	⅞	....
New York Central	92¾	92½	....	¼
Erie Railway	79	72½	....	6½
Hudson River	110	109 ex. d.	4	....
Reading Railroad	101¾	104¼	3½	....
Michigan Southern	81½	80	....	1½
Cleveland and Pittsburgh	80½	79¾	....	¾
Chicago and North-western	26½	26⅞	⅜	....
" " " Preferred	55½	55¼	....	¼
Chicago and Rock Island	116	119½	3½	....
P., Fort Wayne, and Chicago	90¾	91¼	½	....
Canton	48	52½	4½	....
Cumberland	43½	44½	1	....
Mariposa	11¾	13	1¼	....
American Gold	127¼	126¼	....	1
Bankers' Bills on London	106¼	107¼	....	1
Call Loans	6	5	....	1

The stock market continues feverish, excited, and variable. There is a clique in almost every stock, and the bears, thoroughly cowed by their defeat in Michigan Southern, appear to have temporarily abandoned the field to their opponents. Favored by the ease of money, these cliques are piling up stocks in great blocks, and borrowing money on them of the National banks. Should a speculative fever break out, such as we had in 1863 and 1864, they will be enabled to dispose of their property at a profit. Should the market continue as at present, a "brokers' market," in which the "outside public" take no interest, they will hold on until a tightening of money, or some other accident, compels them to realize, and then we shall have a panic. Speculation during the past week has run chiefly upon Reading and the light miscellaneous stocks. Reading advanced at one time to 105. It has been announced that the directors have determined to pay hereafter semi-annual dividends of 5 per cent. The announcement is of doubtful authenticity; but it is not at all doubtful that there is a large short interest in the stock, and that the bulls are going to try to bleed their opponents. The earnings of the road will naturally be smaller this year than last. An active movement has developed itself in Canton, Cumberland, Quicksilver, and Mariposa. Each of these fancy stocks has risen considerably on grounds of varying soundness. Government is said to be about to buy certain land belonging to the Canton Company, and the purchase would, if effected, enable the directors to cancel several thousand shares of stock. Quicksilver has risen on a theory that a new demand is to arise for the product of the mine. No special grounds have been assigned for the improvement in Cumberland, Mariposa, and the other light fancies. They rose simply because, to the Street speculators, they seemed to be "the fashion." Erie has declined heavily—6½ per cent. in a week. The earnings of the road for March show a falling off equal to $260,000. This decline in traffic was pretty generally expected, and it is widely believed that it will continue throughout the year. Michigan Southern lies dead on the market, and the price declines slowly. In the course of a few weeks it may again sell at 65 to 66. The litigation growing out of the recent corner is still pending before the courts. Hudson River advanced 4 per cent. on the dividend, but is now rather offered at the advance. New York Central is inactive. It is understood that the Albany bill is sure of becoming a law. It will add a trifle to the gross receipts of the road, but so much stock has been bought to sell on the news of its passage that the good news is not unlikely to be followed by a decline in the price.

1866.

TOTAL LOSSES paid - - - - - - - -	944,042

NEW FEATURES—NEW TABLES,

By which all Policies are NON-FORFEITING and ENDOWMENT, payable at about the same cost as ordinary Life and Ten-Payment Policies payable at death only. We call special attention to these Tables as exceedingly attractive and ORIGINAL with the UNION. In case payments are discontinued, after two premiums have been paid, the Company contract to pay, AT DEATH or the SPECIFIED AGE, an amount in proportion to the number of premiums paid.

The Percentage system of Dividends used by this Company affords greater protection to the family than any other plan, as in event of an early death the amount of policy paid is twice that paid by all cash Companies with the same cash outlay of premiums.

The greatest possible liberality in assisting parties to keep their Policies in force.

Liberality and promptitude in the settlement of claims.

We refer to the Massachusetts and New York Insurance Commissioners' Reports for 1864 and 1865 as an evidence of the Safety, Reliability, and Unparalleled Success of the Union Mutual.

THE BEST SEWING-MACHINES IN THE WORLD.
THE WEED MACHINES,

With all their valuable improvements, entirely overcome all imperfections. They are superior to all others for family and manufacturing purposes, simple in construction, durable in all their parts, and readily understood. They have certainty of stitch on all kinds of fabrics, and are adapted to a wide range of work without change or adjustment, using all kinds of thread. Will hem, fell, bind, gather, braid, tuck, quilt, cord, and, in fact, do all kinds of work required by families or manufacturers. We invite all persons in search of an instrument to execute any kind of sewing now done by machinery to inspect them, and recommend all parties engaging in the sale of sewing-machines to make sure they secure the best by examining the WEED before purchasing. They make the shuttle-stitch, which cannot be excelled for firmness, elasticity, durability, and elegance of finish. They have received the highest premiums in every instance where they have been exhibited in competition with other standard machines. The company being duly licensed, the machines are protected against infringements or litigation.

Reliable agents wanted, to whom we offer great inducements. Every explanation will be cheerfully given to all, whether they wish to purchase or not. Descriptive circulars, together with specimens of their work, will be furnished to all who desire them by mail or otherwise.

Improvements in Piano-fortes.

One of the simplest and most truly valuable improvements yet made in the Piano-forte is that invented and patented by

DECKER BROTHERS, 91 BLEECKER STREET,

in this city. By correcting the only imperfections arising from the use of the full iron-plate, and that, too, by not detracting in the slightest degree from its many positive advantages, the Messrs. DECKER have developed in their instruments a tone at once admirable for its purity, fulness, prolongation, and sweetness, and the high estimation in which their improvement is held is well shown in the rapidly increasing business of their firm.—*Tribune.*

MARVIN'S

PATENT FIRE AND BURGLAR SAFE:

Superior to any others in the following particulars:
They are more fire-proof.
They are more burglar-proof.
They are perfectly dry.
They do not lose their fire-proof qualities by age.
Manufactured only by

MARVIN & CO., 265 Broadway.

Second-hand Pianos at bargains, prices $60, $75, $100, $125, $150, $175, $200, and $225. Factory and Warerooms, 481 Broadway. Cash paid for second-hand Pianos.

STEINWAY & SONS'

GRAND, SQUARE, AND UPRIGHT PIANO-FORTES

Have taken Thirty-two First Premiums, Gold and Silver Medals, at the Principal Fairs held in this country within the last ten years, and in addition thereto they were awarded a First Prize Medal at the Great International Exhibition in London, 1862, in competition with 269 Pianos from all parts of the World.

That the great superiority of these instruments is now universally conceded is abundantly proven by the FACT that Messrs. Steinways' "scales, improvements, and peculiarities of construction" have been copied by the great majority of the manufacturers of both hemispheres (AS CLOSELY AS COULD BE DONE WITHOUT INFRINGEMENT OF PATENT RIGHTS) and that their instruments are used by the most eminent pianists of Europe and America, who prefer them for their own public and private use, whenever accessible.

STEINWAY & SONS direct special attention to their

PATENT AGRAFFE ARRANGEMENT,

which, having been practically tested in all their grand and highest-priced Square Pianos, and admitted to be one of the greatest improvements of modern times, will hereafter be introduced in EVERY PIANO MANUFACTURED BY THEM WITHOUT INCREASE OF COST to the purchaser, in order that ALL their patrons may reap its benefits.

STEINWAY & SONS' PIANOS are the only American instruments exported to Europe in large numbers, and used in European concert-rooms.

WAREROOMS, 71 & 73 EAST FOURTEENTH ST., between Union Square and Irving Place, New York.

JOSEPH H. RICHARDS, PUBLISHER, 130 NASSAU STREET, N. Y.

The Week.

THE overworked President made two speeches last week, one to a procession of negroes and one to a procession of discharged soldiers and sailors. The first was brief and remarkably incoherent. Eight or nine times in the course of five minutes the negroes were told that the day would soon come when they would see who had been their true friend, more their friend than any other man, and who had been riding the colored man for the sake of being carried into power. There was little else in the speech. The second, a longer one, was less rambling, but the display of ill-temper, as it must be called, was even greater than in the speech to the negroes. The policy of reconstruction which the President approves was once again explained and "the soldiers and sailors expressly" were asked to support it. The President took it for granted that the Congressmen who oppose it are not seeking a different method of "triumphantly passing through our third ordeal;" but that it is their purpose to gratify the "feelings of resentment which animated us when the excitement was running high," and "to destroy the States." Incidentally the President said that it was easy to impugn motives, and that he seriously intended to be the "tribune of the people."

IN three cases already the civil rights bill has appeared in the courts. In Baltimore, on the 14th instant, a colored man sued his employer, the captain of an oyster boat, for wages withheld from him. The magistrate admitted the negro's testimony, the captain acknowledged the debt, and the money was paid. On the 18th instant, a person of color was for the first time admitted as a witness into the State court of Maryland, at Annapolis, the counsel introducing him claiming the right to do so under the provisions of the bill. Previously, on the 11th instant, a case occurred in Indiana in which the bill seemed in a fair way to be tested in a United States court. The turn it took is worth recording. A negro had sued a white man for breach of contract. The defendant, in his answer, set up the 13th article of the State constitution, which forbids negroes to enter the State, and debars them from making or enforcing contracts. The plaintiff demurred, maintaining that for three reasons that article was void, the third reason being that it conflicted with the 1st section of the civil rights bill. The justice decided in favor of the plaintiff. The case went into the U. S. Circuit Court on appeal, and the decision of the justice was there sustained, but on the ground that by the Constitutional Amendment abolishing slavery a negro is a citizen of the United States, and as such qualified to make and enforce contracts. The civil rights bill, the judge held, had not yet been officially promulgated, and for that reason, and for that reason only, the plaintiff could not rely upon it.

IT seems to be beyond a doubt that the disease at the Quarantine is not ship fever, but the true Asiatic cholera. As yet it has not reached the city. The steamship *England* has arrived from Halifax with all on board well. The total number of deaths aboard her after she left Liverpool was 250. On the *Virginia* the deaths up to Sunday were 61, and the number of persons under treatment was 70. Both vessels and the hospital steamer *Falcon* are at the lower quarantine ground. The Board of Health is proceeding very vigorously. At the last meeting it was decided that temporary hospitals should be provided in various parts of New York and Brooklyn; that the services of physicians whose treatment of cholera was successful during its former visitations should be at once secured; that an order should be put forth interdicting the sale of certain unwholesome articles of food, including, among others, veal and other young meats, and that the underground population of New York and Brooklyn should be removed from their cellars to healthier abodes. For the moment, in sanitary matters, our unsuccessful republic of New York is a republic opportunely tempered by a dictatorship.

ON Saturday a criminal action was brought against Otto Burstenbinder, a dealer in nitro-glycerine, who is charged with violating the United States statute which makes it a misdemeanor to ship any explosive materials liable to ignite by friction without first packing them securely, and marking the name and the description of the articles on the outside of the package. Nitro-glycerine, or Nobel's blasting oil, is not manufactured in this country, and we believe that Burstenbinder is the only importer. At any rate, a quantity of it in a pine box, and without the precautionary marks, which he forwarded to San Francisco, caused the terrible accident there which cost seventeen people their lives, and which has been followed by the still more awful catastrophe at Aspinwall. There is a theory that nitro-glycerine is not subject to spontaneous combustion, and this Mr. Burstenbinder probably knew. But there is a well-known fact that a quantity of nitro-glycerine did, not long since, explode, spontaneously to all appearances, at the Wyoming Hotel, and this also he probably knew. So, unless we suppose him ignorant of the statute above-mentioned, he lies under a dreadful responsibility. All the nitro-glycerine in the city has been removed by order of Mayor Hoffman, and is now stored in a detached magazine, with a guard over it.

MR. RAYMOND, of the Committee on Foreign Affairs, has made a preliminary report on the fishery question. It appears that the treaty of 1783 gave American fishermen in colonial waters the same rights as are enjoyed by British fishermen. In the treaty of 1814 the fisheries were not mentioned; and in 1818, to allay troubles that had arisen, a convention was made under which we were debarred from fishing within three miles of land. Troubles again arose, for the English held that the line of exclusion should not follow all the sinuosities of that winding coast, but should be drawn from headland to headland of all bays, the great as well as the small. The crown lawyers maintained that the war of 1812 and the treaty of 1814 annulled the treaty of 1783, and invalidated all concessions made by it. The dispute was never settled, but in 1854 the Reciprocity treaty made the fisheries completely free. Now the Reciprocity treaty is at an end, and the question arises, What treaty defines our rights? If the treaty of 1783 was annulled by war and treaty, is that of 1818 good, which was an-

nulled by treaty alone? Mr. Raymond thinks not, evidently believing war to be no more powerful than treaties in its nullifying effect.

In a recent suit in Massachusetts, involving a promissory note, the defendants demurred to the declaration required in the writ, because on the copy of the note annexed there was no indication of the stamp which was affixed to the original. The Supreme Court, on an appeal from the Superior Court, decided that "a revenue stamp is no part of the note and need not be copied; nor is the validity of the note affected by the want of a stamp, unless it is omitted fraudulently." Judge Hoar pronounced in effect the same decision in the case of a deed to which no revenue stamp was affixed. Whatever may have been the intention of Congress in framing the internal revenue law, he was "clear in the opinion that a statute of the United States, undertaken to invalidate an instrument which by the laws of the State is valid, would be unconstitutional. The Government may exact a penalty for failure to affix the stamp, but cannot make void the instrument for lack of the stamp."

A committee of the Chicago Academy of Sciences have been examining the flesh of swine, slaughtered in that city, with a view of finding out whether the *trichina spiralis* exists in American pork. They report that 1,394 hogs were examined, and that of these twenty-eight, or more than one in fifty, were diseased. In some cases the number of worms in a cubic inch of meat was as high as 18,000. The advice given by the committee is such as the public has heard before: hogs are not to be allowed animal food; pork must be well cooked, or well smoked, or desiccated, before it is eaten; pickling does not destroy the trichina.

C. C. Clay has been released upon his parole and goes to Alabama, which he is not to leave without permission. General Grant, Senator Wilson, Mr. R. J. Walker, Mr. Thaddeus Stevens, and others recommended his liberation, none of them believing him accessory to Mr. Lincoln's murder. Mr. Stevens, it is reported, if he had his way, "would try him as a belligerent, confiscate his property, and let him go." If Mr. Stevens really made this brilliant suggestion—which we doubt—he ought to explain in what the offence of a "belligerent" consists, and before what tribunal the offender is indictable. Clay's release, we presume, disposes of the story lately set afloat by the correspondents that a mass of astounding evidence had been discovered proving Davis, Mallory, Clay, and many more to have been implicated in the assassination conspiracy.

There are many cooks at work upon the scheme of military administration, both as regards the standing army and the militia. The war proved again and again what no man with any knowledge of history required to be proved, the utter absurdity and wastefulness of an old system. There is great danger, nevertheless, that its essential faults will be re-established. The influence of private and class interests is much too evident in the discussion of the matter to allow us much confidence that an efficient, well-guarded, economical, comprehensive plan of national defense can be wrought out during the present session of Congress.

The Cincinnati *Gazette* calls attention to one or two incidents in the career of Mr. Henry S. Stanberry, who has just been nominated for the judgeship of the Supreme Court, which are worth notice. It is now pretty well known that he was the gentleman who supplied Mr. Johnson with his legal objections to the civil rights bill. But in addition to this, he made a speech at Cincinnati, in 1861, in which he demonstrated that there could be no war, because all the Government could do was to enforce the law, after indictments had been presented by the grand juries and warrants had been placed in the hands of the marshals. But there were neither marshals nor grand juries in the South, and therefore the Government could do nothing. The Union was to perish, like the Queen of Spain who was burnt up in the presence of the courtiers, owing to the absence of any functionary duly authorized by court etiquette to lay hands on the royal person. Mr. Stanberry insisted in an argument equally luminous that Sherman's treaty with Johnston was an official recognition of the restoration of the revolted States to their old status in the Union—the cessation of hostilities leaving everything as it was before the war. Mr. Stanberry is, we believe, a man of the very highest character, and a lawyer of very unusual attainments, and we confess we have on general principles the strongest objection to seeing enquiries instituted into any man's political views for the purpose of ascertaining his fitness for a seat on the judicial bench. But then the truth is that the Supreme Court does not simply declare the law; it to a certain extent shapes the polity of the country, and the opinions of its judges as to the fundamental structure of the Government are, and will be for some time to come, of the last importance. Mr. Stanberry's mind, whatever else it may be, is not that of a statesman, and a judge of the Supreme Court ought to be a statesman. His total want of humor, or, in other words, of a sense of the just relation of things, was well illustrated by his objection to the civil rights bill, on the ground that it would give citizenship to the gipsies, and might possibly lead to a legalization of mixed marriages by Congress. In the atmosphere of one-third constitutional law, one-third general jurisprudence, and one-third political expediency, in which the Supreme Court passes its time, there is some danger that Mr. Stanberry would be asphyxiated. He needs the sharp air of the common law to secure the healthy action of his mind.

The managers of the Boston theatres are said to have combined to resist prosecution under the law prohibiting them from excluding colored persons from their entertainments. The penalty, apart from the loss of custom, is a mere fine, and these gentlemen, who ought to "advertise in the New York *Herald*," believe that prejudice has not yet become too dear a luxury.

Five gentlemen one after another, ex-Governor Tod, of Ohio, being the last, have recently taken occasion to rebuke a piece of political knavery which is so disgracefully common that it must sometimes be successful. They announce that when the "Johnson National Union Club," the one with Mr. Montgomery Blair at the head of it, printed their names in its list of vice-presidents, it was guilty of borrowing them without leave. In this latest instance the trick seems to have been practised more boldly than usual, and the exposure of it is correspondingly public.

We see it stated in a Chicago paper that a tobacco firm of that city, which employs some thirty hands, is making trial of the eight-hour system. Their experience is said to show that as much work is now done in eight hours as ever was done in ten, and therefore they are paying the same wages as before. We very much hope the experiment may continue to give satisfaction to both parties, and we are glad to see it tried. Just as soon as it is proved that as much of a given kind of work can be done in the short day as in the long, we have no doubt that the wages of eight hours and the wages of ten will be the same. And whenever it is proved true of all kinds of work that as much of it is done in eight hours as can be done in ten, there will be no need of the legislatures interfering. Meantime, the movement has reached Washington, and a resolution has been introduced in the House which looks to the establishment of an eight-hour rule in the District of Columbia. The Massachusetts House rejected an eight-hour bill on Friday. It had already passed to a third reading a bill providing for an inspector of children in manufacturing establishments, and of apprenticeships.

Our French correspondent told some weeks ago the story of the seizure in Paris, by the Prefect of Police, of the whole edition of the Duc d'Aumale's "Histoire des Princes de la Maison de Condé." As our readers know, that great safeguard of freedom, the right of every citizen to prosecute government functionaries for illegal acts before courts of law, has never been enjoyed by Frenchmen, and, of course, there is as little disposition to concede it, even under the Empire, as ever before, although without it all other rights may be said to be a mockery. Of what use would Magna Charta or the *habeas corpus* be to a man

who, when a police officer choose to lock him up or seize his goods under a government order, had no better remedy than a protest? In France you may sue an official, but you must first get leave from the Council of State; which is, of course, tantamount to not being able to sue him at all. The Duc d'Aumale sought the required permission, and his counsel was heard on the point of law. The result has been a decree, stating that as the prefect who made the seizure acted under the orders of the Minister of the Interior, his superior officer, the Duc d'Aumale, the publisher, and all others concerned, may go about their business, for the prefect they may not sue.

Some idea may be had of the way in which foreign names are mangled between the telegraph and the printer, by a chain of blunders in one of our daily papers last week, in a despatch from Berlin. Instead of "the fortresses of Glatz, Casel, Neissef Forgan, Wittemburg, Spandan, and Madgeburg are to be armed," one should have read Cosel, Neisse, Torgau, Wittemberg, Spandau, and Magdeburg. The same paper once described the journey of the Tunisian embassy from Leghorn to Paris by the unheard-of route of Mt. Sinai! *Mt. Cenis* was, of course, intended. An explicable if not excusable blunder was that in which the entire press of this country participated some time ago, when the Czar (Alexander III.) was said to have declared that Lithuania was worse governed now than it had been under Nicholas. The *Czas*, a Polish newspaper of Cracow, was the author of a statement otherwise so unfilial on the one hand, and so self-damaging on the other.

Laboulaye has betaken himself to Strasburg, and written a letter, through the press, to the liberal constituency of the district. It is noted as a singular circumstance that, in a department chiefly inhabited by Catholics and Israelites, the rival candidates are both Protestants.

A co-operative society of journeymen printers, at Paris, has received the Imperial warrant, much to its surprise and to the great joy of the 24,000 printers of the city.

Italy reckons 164 public libraries and 46 not accessible to the public; 33 belong to the Government. Of these, 39 are devoted to special subjects, including literature and science (11), and fine arts exclusively (3). The 210 libraries contain 4,149,287 volumes. The taste of readers is indicated by the fact that out of 988,510 books called for in 1863, 183,528 pertained to mathematics and the natural sciences; 121,496 to history and physiology (the classification is not ours); 70,537 to philosophy and morals; 54,590 to religion; 193,927 to law. The students of the fine arts had occasion for 261,689 works.

A suppressed letter of Mazzini's has just come to light. It was written immediately on hearing of his election at Messina, but was withheld from publication for political reasons by his assumed friends. The substance of it is, that the republican of thirty-four years' standing may, for the sake of Italian unity, hold his political doctrines in abeyance, but can never stultify himself by taking the oath of allegiance to a monarchical government. He thanks the electors of Messina for their generous protest, in a spirit of firmness characteristic of Sicily—an island, he adds, in which "I was not born, and which, it grieves me to reflect, I have never visited."

The autopsy performed on the body of a young officer recently deceased of typhus at Tournay, in Belgium, discovered the extraordinary fact that the usual position of the vital organs was completely reversed with him, and that the heart, instead of being on the left side, had worked with perfect regularity on the right. One only regrets that Molière's "médecin malgré lui," who has had the laugh against him for nigh two centuries, was not able to attend this curious case. He might then have re-affirmed with gravity: "Yes, that used to be so; *mais nous avons changé tout cela*, and we practise medicine now on an entirely different theory."

The Russian nobility were repulsed last month in a firm but respectful endeavor to extend the constitutional privileges not only of their own order but of the entire country. They asked, first, that their wishes might be allowed on all occasions to go straight to the ear of the Emperor himself, and thereupon be examined by the legislative power; thence to be submitted to the administration, and considered by the full cabinet of ministers. They asked, further, that the deputies of the assemblies of the nobles and of the territorial assemblies should have the inalienable right of voting in the deliberations of the legislative power on questions arising out of the petitions of the assemblies. The Emperor replied that it was not the business of the nobility to take the initiative in fundamental reforms like this. So the nobility of St. Petersburg contented themselves with ordering a portrait of Prince Schterbatoff, their head, who had proposed the unsuccessful address to the throne.

CONGRESS.

Washington, April 21, 1866.

The week has been fruitless of legislation upon the vital and overshadowing question of restoring the Union. Instead of this, the House has occupied nearly the whole of each day's session upon the bill to re-organize the army of the United States, a very important measure, upon the details of which opinion is greatly, if not hopelessly, divided. The House Committee on Military Affairs, at the head of which is General Schenck, of Ohio, has matured a bill differing most materially from that which has already passed the Senate. The House bill proposes many radical changes and reforms in the service, the most vital one being a thorough revisal of the whole list of army officers by a board of generals, to determine what officers shall be retained in the service. Of course this feature meets with bitter if not general opposition from officers of the present army and their friends in Congress. The House bill also proposed to retain the present Veteran Reserve Corps, with its officers, as a permanent feature, constituting ten regiments, and increasing the army to a total of fifty-five regiments of infantry, instead of fifty, as provided by the Senate bill, which also dispensed with the Reserve Corps. The House has added two regiments of colored cavalry, and, by a close vote, has adopted an amendment proposed by Mr. Conkling, of New York, providing for mustering out all officers of the Veteran Reserve Corps. In fact, the bill has been so cut up and amended in all directions by the House as to be now scarcely recognizable by its own father, and it is now generally thought that it will be killed at last without becoming a law.

Whether the army bill which passed the Senate will share the same fate remains to be seen. That bill, however, has the advantage of being approved, in its main features, by Lieutenant-General Grant, Major-General Meade, and other generals of the highest rank, who have considered maturely the details of our permanent army organization.

The President's recommendation to Congress, that the test oath of July 2, 1862, be modified so as to permit officers of the Revenue and of the Post-office Department to be appointed in the rebellious States without the necessity of swearing that they have never aided the rebellion, is to be reported against by the Judiciary Committee of the House. Yet the Secretary of the Treasury and the Postmaster-General are positive in the opinion that the Government cannot get along and collect its dues at the South without a relaxation of this law.

The scheme of national telegraph lines, to be owned and operated by the Government, has got so far as the appointment in the Senate of a select committee, of which John Sherman is chairman, to investigate and report upon the subject. Such a system would unquestionably be a great popular benefit; and it is furthermore easy to see that the Government might make the lines self-supporting for greatly less than a moiety of the prices now charged for telegraphic messages, even were it found that the claim of the friends of the scheme was not wholly borne out—namely, that telegraphic communication can be reduced to the present price of letter postage, or three cents for a message of ten words or less. One principal motive which should influence the Government in favor of the speedy establishment of telegraphic lines of its own, at least over all our leading post-routes, is the present enormous cost of the Government's own telegraphing business. It is understood that

Postmaster-General Dennison is favorable to the scheme, and the present is certainly a most opportune season for carrying it into effect.

DIARY.

Monday, April 16, 1866.—In the Senate, the bill to rescind the order of President Lincoln designating the Sioux City and Pacific RR. Co. to construct a branch of the Union Pacific Railroad was discussed at length and laid over. Also, a bill for relief of certain naval contractors. A bill was passed to incorporate the District of Columbia Canal and Sewerage Company.

In the House, Mr. Hill offered a constitutional amendment to base representation upon voters. Mr. Jenckes offered a joint resolution to make elections of representatives to Congress uniform in all the States, and to provide a registration of voters, and to require loyalty as a test. Referred. Mr. Ingersoll offered a resolution looking to the establishment by Congress of the eight-hour system of labor throughout the District of Columbia. A motion to lay it on the table was lost—yeas, 15; nays, 92. Laid over.

On motion of Mr. Farnsworth, the Judiciary Committee was instructed to enquire into the propriety of confiscating lands purchased by the late Confederate States, and used for prison camps, etc.

April 17.—In the Senate, a joint resolution making an appropriation to enable the President to make treaties with certain Indian tribes was passed. The bill to amend the *habeas corpus* act of 1863, so as to save U. S. officers from prosecution for acts done by military authority, was debated at length.

In the House, resolutions of the convention of Texas in favor of a Southern branch of the Pacific Railroad were received, and referred to the Pacific Railroad Committee. The day was spent upon the bill for re-organization of the army.

April 18.—In the Senate, the bill to pay certain contractors an extra compensation for vessels of war and steam machinery was debated at length.

In the House, the army re-organization bill again occupied the day. An amendment providing that all officers of the Veteran Reserve Corps except those detailed for duty in the Freedmen's Bureau shall be mustered out of service and put on the same footing with other disabled officers, was adopted—yeas, 59; nays, 43.

April 19.—In the Senate, Mr. Wilson moved to reconsider the vote by which the Senate rejected the admission of Colorado as a State. The motion to reconsider was opposed by Messrs. Sumner and Grimes, who argued that the population of the Territory was too small for a State, and that its constitution denies suffrage to men of color. Made a special order for April 24.

In the House, a bill to regulate the terms of U. S. Courts in the Eastern District of New York was passed. A bill to increase the salary of the Commissioner of Pensions from $3,000 to $4,000 was passed—yeas, 61; nays, 51. The day was again occupied by the army bill.

April 20.—In the Senate, a joint resolution to extend the time for the construction of the first section of the Western Pacific Railroad was passed. The bill to protect United States officers from prosecution for acts done under military authority during the rebellion was debated at length. An amendment offered by Mr. Edmunds, of Vermont, to limit its operation to acts done in the rebel States, was lost—yeas, 10; nays, 29. An amendment excepting from the protection of the bill "acts done with malice, cruelty, or unnecessary severity" was adopted—yeas, 18; nays, 16. The bill was then passed—yeas, 30; nays, 4. Adjourned to April 23.

In the House, several private bills were passed, and the bill for the re-organization of the army was further debated and amended.

April 21.—The Senate was not in session. In the House, several speeches on the state of the Union were made, but no business was done. Adjourned to April 23.

THE FREEDMEN.

The event of the week for the freedmen has been their celebration at the Capital of emancipation in the District of Columbia. The actual anniversary of this great event is April 16th; but the unpropitious weather caused a postponement till the 19th, and the date thus selected was doubly pregnant with associations of freedom. We are glad to adopt the *Times*' report of the proceedings as telegraphed by its Washington correspondent:

"The colored people turned out almost *en masse*, arrayed in their very best, and entirely through their own effort arranged and carried out one of the most successful celebrations ever witnessed in this city. There were two colored regiments in the procession, fourteen civic societies, with banners and regalia, several ward clubs very strong in numbers, and a number of school and juvenile societies. The procession was over a mile in length, and filled Pennsylvania Avenue from the Capitol to the White House, and must have contained 8,000 persons. The march was enlivened by music from six brass bands and several drum corps, all composed of colored musicians. The American flag was proudly borne at brief intervals along the entire procession, and as the swarthy column moved along the Avenue, with flashing bayonets and fluttering flags and waving banners, the sight was very imposing. There were many excellent portraits of President Lincoln borne in the column, draped in mourning or wreathed in evergreens, and many grateful and touching allusions to him on the banners and devices. The column complimented the Freedmen's Bureau, Gen. Grant's headquarters, the White House, the Capitol, and all the public buildings, by marching past and cheering them. The President made them a brief speech, and the cheers of the column at the Capitol induced an adjournment of the Senate at 1:30 o'clock. The House did not adjourn, though while the procession was passing the east front of the Capitol almost every member left his seat to witness it. On returning to Franklin Square—the place of rendezvous—speeches were made by Gen. Butler, Gen. Howard, Senator Wilson and others. The whole affair has been conducted with remarkable order and decorum. Not an intoxicated or disorderly person has been seen on the streets, and the colored people have elevated themselves in the estimation of many of the prejudiced whites by their creditable conduct. So generally did they participate in the event that nearly every kitchen, laundry, barber shop, restaurant, or hotel dependent upon them has been virtually suspended in its operations to-day. The weather was very delightful, and all outward circumstances contributed to the success of the celebration."

—On the same day there was a large procession of the negro population of Hampton Roads and the surrounding country, in honor of the passage of the civil rights bill. Perfect order prevailed, and addresses were delivered by several officers of the department and the Bureau.

—On Saturday forty-eight colored prisoners at the Washington jail—men, women, and children, who all stood committed for petty offences—were, with their own consent, released and sent on their way to Louisiana in charge of Mr. C. L. Howe, an agent of the Bureau. One hundred and twenty-five other freedmen accompanied the party, with a more or less definite prospect of employment and good wages.

—Section 12 of "an act prescribing additional punishments for the commission of offences against the State [of Florida], and for other purposes," provided for stripping the freedmen of their private arms. Trouble seemed likely to ensue, when, upon the protest of the assistant commissioner of the Bureau, and the resolute opposition of Gen. Foster, Gov. Walker was induced to consult the attorney-general, who decided that the section in question was unconstitutional.

—Gen. Tillson is enquiring, through the agents of the Bureau in Georgia, whether the civil authorities are in good faith endeavoring to protect the freedmen by arresting and punishing those who abuse them; and whether the temper of the whites is so unmistakably improving as to render the presence of the Bureau unnecessary at no distant day.

—Long ago General Banks imposed a tax upon the white people of Louisiana for the support of colored schools. He imposed it, but no one collected it until Mr. Conway became assistant commissioner of the Bureau for the State of Louisiana. When General Fullerton relieved Mr. Conway, the collection of the tax was stopped, if not by order of the President, at any rate in pursuance of advice which the President telegraphed to New Orleans. But the Bureau, trusting to the income from this source, had established many schools and had been allowed to run heavily in debt to the United States quartermasters for the means of carrying them on. It became necessary to pay the borrowed money. After General Fullerton had left the State, General Canby, despite the objections of the civil authorities, ordered his provost-marshals to proceed in the work of collection. The tax had been imposed by competent authority, he said. This collection has now for the second time been stopped by the President. A correspondence has recently taken place between him and Governor Wells in relation to this matter. The governor tells the President that the people of the State are in anxious expectation of relief from him, more especially since his proclamation of peace. The President responds, that all orders for the collection of taxes by the Freedmen's Bureau are suspended. It is exceedingly doubtful, therefore, whether General Banks's favorite plan of making Louisiana educate all its ignorant population without distinction of color will ever be carried into effect.

—Another interesting decision touching the present value of former property in human beings comes from Georgia, having been read by Judge Speer at the April term of the Sumter Superior Court. In 1860, it appears, James W. Armstrong sold Columbus W. Hand and others three negroes, for whom he received the notes of the purchasers. Upon these notes the suit was brought. The plea of the defendants was that the seller had warranted the men slaves for life, and that by the abolition of slavery there had been failure of consideration and breach of covenant. The court held that the covenant only warranted the title and *status* of the slaves as the law then stood, and that the covenant was repealed by act of Government. Judgment was therefore entered for the plaintiff; but the case will probably go up to the Supreme Court.

—The text of the constitutional amendment adopted by the Texas convention on the subject of education is before us, and enables us to correct a wrong inference which we made last week from Gov. Hamil-

ton's speech. The amendment provides for a perpetual school fund by the appropriation of certain lands and other State property, but the blacks are expressly excluded from the benefit of this fund, and the legislature is forbidden to pass any law admitting them. Whenever a specific educational tax is ordered, the contribution of the blacks is to be set apart for public schools for them; "and it shall be the duty of the legislature to encourage schools among them."

Minor Topics.

A PUBLIC vice, by no means new, but we fear gaining ground, is a sentimental sympathy with criminals. The story of the Frenchman who, upon trial for murdering both his parents, besought the judge to have pity on a poor orphan, is no longer absurd, for society, taking the place of the judge, is ready to grant the desired pity. Society felt *so* sorry for pretty Mary Harris, who could not help feeling very badly at being shut up in a dirty jail, and being tried before horrid men; but society thought nothing about the other woman in the case. We are all perfectly familiar with, and can account for, the morbid feeling which leads people to gloat over details of murders and to hanker for relics of executions, from the palmiest days of Newgate down to the recent cases of Pellicier and Gonzales, photographed with the immortal Captain Waddy grasping their collars with a now-I've-got-you air, and of the murderer of the Deering family, marched to the photographer immediately upon his arrest. These are the exceptional acts of individuals, but is society really bent on becoming itself *particeps criminis?* No sooner is a criminal, by some accident, past saving by disagreeing juries and the granting of new trials, than everybody concurrently sets to work to find good reasons why, in *that* particular instance, the penalty should not be inflicted. Strange to say, the prime movers are apt to be not the professors of crime, but men of the highest standing; and, stranger still, the basis of their plea is likely to be the youth and innocence of the culprit. In the State of Vermont no man could possibly devise a murder for which he would actually be hung, for the public head has so softened there since the renegade Redding was executed by Ethan Allen that a murderer would be treated as Uncle Toby treated the fly. Massachusetts—the State where crime is supposed most certain to receive swift punishment—happening to have had an executive of weaker stuff than she had when justice, by the execution of Dr. Webster, received the most impressive vindication the country ever saw, has at last executed the Malden murderer, Green, after delaying so long that the lesson of the act is past. A prominent journal of this city prints a special account of the execution, editorially characterizing it—the account—as "painfully interesting." That it was fully meant to be so is quite evident. We quote a few sentences to show how artfully the dodge of youth and innocence is worked up:

"He was frightfully excited. Every pore of his skin seemed to be a pulse. Throb! throb! throb!

"And all the while that infernal hammer! hammer! hammering!

"The wretched man seemed to cling to me as if he had been wild for some friendly heart to lean on. I did not push him away, but fondled the poor boy. He quickly became quiet, and talked with composure.

"'I will die like a man,' he said, 'and yet I can't help feeling that I am to be executed more to satisfy the prejudice of the people than for justice. People look on me as if I was a monster some six feet high; they seem to think that their lives will not be safe if I am not executed.'

"I could not deny the statement, ridiculous as it seemed when one looked at the slight form, which quivered from time to time, as he lay quietly on my breast.

"This morning I saw him again at nine o'clock.

"He was entirely changed.

"When I asked him how he was,

"'I am happy,' he said, calmly and sincerely.

"I have not the heart to relate his religious conversation, boyish and simple and quiet as it was. He lived a boy, silent about religion; he died a boy, talking about religion."

Now we say nothing here upon the propriety or impropriety of apital punishment, but only protest against the growing sentimentalism that has only sympathy for the criminal; that holds that a man who has committed a foul deed is, therefore, proved to be lunatic or idiot; that depicts the executed murderer as a martyr, forgiving upon the gallows all his enemies—*i. e.*, the witnesses, prosecuting attorney, the jury that convicted, and the judge that sentenced—all but the sheriff, who has learned to love him during his confinement and is always his dearest friend. Is crime to be punished? that is the real question. Hanging is by some called judicial murder; but the murders which difficult convictions and pardoning executives encourage—what sort are they, theorist? Let the chances of punishment be doubtful, and crime will give itself the benefit of the doubt. Criminals split heads rather than hairs; they cannot appreciate the finely-drawn distinctions of a commission *de lunatico inquirendo.* Moral responsibility and moral insanity they neither understand nor regard; but legal responsibility they do; and if this man, who killed that man, is hung, or is not hung, they know it and infer accordingly, deriving therefrom all degrees of courage up to that degree by which a trial becomes a pleasant little excitement in an otherwise dull life.

THE scene in the Senate last week between Messrs. McDougall and Conness, in which the former defended himself against the charge of habitual drunkenness, and therefore of constant unfitness for legislative duties, by relating an anecdote in which profanity and obscenity were combined in about equal proportions, was almost as discreditable to the rest of the body as to the two actors in it. It is not greatly to be wondered that there should be States inside the vast area of the Union which send men to Congress who care very little for parliamentary proprieties, and who, in fact, have very little respect for the restraints which the usages of older or more civilized societies impose on men's tongues as well as on their fists. There will always, for instance, be of necessity a good deal of roughness in the manners of border communities, and the men they send to represent them in Congress will, in nine cases out of ten, for reasons too numerous to be stated here, oftener fall below than rise above the average of their constituents. But then it is the business of the Senate to see that they are forced to submit to the rules of the body, and that the safeguards it has provided for the dignity and decorum of its proceedings are not violated with impunity. Mr. McDougall's outbreak was very repulsive, but was it on the whole more repulsive than the helpless, passive silence in which the Senate and its presiding officer listened to him? When he had said all he had to say, and had driven the ladies from the galleries, and disgraced the Government and the country, a mild remonstrance was heard to issue from the Chair. The senator was informed that his language was improper and that he must not repeat it. The naughty man accordingly sat down, no doubt overwhelmed with confusion, and the decent Christian portion of the nation which feels the Senate's honor to be its own, will, of course, feel satisfied hereafter that drunkenness and ribaldry cannot have a hearing in what ought to be the most august assemblage in the world.

Are we never to see a Congress which will have the courage and self-respect to punish this sort of outrage by promptly expelling the offender? Somebody ought, at all events, on such occasions, to have the manliness to rise and move that blackguard language, when uttered in the legislature, be, according to parliamentary usage, taken down, and then, if not properly atoned for, move that the offender be expelled. Even if the motion were not successful, the credit of the body would be to a certain extent saved by showing that a portion of it, at least, winced under disgrace. And nothing could do more to promote care on the part of constituencies in the selection of representatives than the exhibition of more sensitiveness on the part of Congress touching the behavior of its members. If districts and legislatures knew that foul-mouthed drunkards would be turned out of their seats the first time they made a display of their weaknesses, legislatures and districts would not so often send them to Washington.

The special attention of the reader is directed to the Financial Review on another page. Its place among the advertisements is by no means significant of its value, but is resorted to only that we may obtain the latest intelligence of the market.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

THE POWER OF CONGRESS TO ENFORCE EQUAL SUFFRAGE.

WHEN Mr. Johnson was urged, a little less than a year ago, to rebuild government at the South on the basis of equal suffrage, he declared himself unable to see how it could be constitutionally done. The same objection has been raised again and again not only by enemies of the measure, but also by many of its professed friends. It has been generally conceded that the Federal Government has no power to interfere in New York or Connecticut with the right of suffrage, and it is, therefore, asked, with an air of triumph, how it can have any greater right to interfere with similar regulations in South Carolina and Mississippi.

It must be admitted that some of the answers which have been given have failed to convince the mass of the people. Mr. Stevens maintains, and with a strong array of reasoning, that the South is mere conquered territory, as absolutely at the disposal of the Government as was California in 1848. But this doctrine is almost as unpalatable to the conquerors as to the conquered, and even those who believe in it as a matter of law are unwilling to make it a basis of action. Mr. Kelley has cited good authority in favor of the power of Congress to regulate the right of suffrage for its own members in all the States. But this is too broad a doctrine for general acceptance without clearer evidence than has yet been produced. The plea of State necessity has also been raised, and some who do not believe that the Constitution sanctions such an act, have urged that the Constitution should be disregarded in view of the present necessity. This is a dangerous theory, which has been endured rather than sanctioned through the war, and cannot any longer be tolerated.

There remains, however, an argument which has, we believe, convinced a majority of Congress, but which has not been sufficiently insisted upon before the people. The great fact of the total destruction of civil government in the revolted States, by their own formal act, obliterating everything which made it possible to recognize any officer acting therein from 1861 to 1865, has been accepted as true by all parties at the North except the most extreme sympathizers with the rebellion. It has been the keystone of Mr. Johnson's policy, as well as of that of Congress. His second proposition, that it is the duty of the United States to guarantee to all the States a republican form of government, meets with the like universal acceptance. His theory that Congress has no share in carrying out this guaranty was rejected by the entire Democratic party in 1863 and 1864, and is rejected by nine-tenths, or, to speak more accurately, by one hundred and twenty-two out of every one hundred and twenty-three of the Union party now. We do not propose to discuss that question again at present.

Assuming, then, that civil government had perished in the eleven States, that the action of Congress was necessary to re-establish it, and that the action of Mr. Johnson in that direction was unauthorized and void (all of which we have endeavored to demonstrate on previous occasions), it is plain that the way is clear for Congress to adopt such measures as may seem to it advisable for the purpose of restoring these local governments. It has been settled by the most solemn adjudications that, where such a discretionary power is vested in any branch of the Government, no one can question the terms upon which it exercises that discretion, or dispute the validity of its acts by showing that the power might more judiciously have been used in another way.

Congress must provide for each of these States "a republican form of government." Not necessarily the *same* form which existed before 1861. They differed in form, and Congress is at liberty, if it chooses, to give them all one form. If no other form than the one that previously existed is republican, then all the States but one must be anti-republican in form, for they all differ from one another in their framework of government. Equal suffrage is clearly not opposed to the epublican idea, even if it is not essential to it. What, then, is there to hinder Congress from prescribing equal suffrage as the means by which civil government shall be reinstated where it has perished? *Some* kind of suffrage is necessary for the purpose, and Congress being under no obligation, according to the Constitution, to confine itself to any particular method, has a perfect right to choose the best way.

Moreover, the method which Congress would certainly choose, no matter what party should control it, would be the summoning of State conventions. No man can find one line in the old constitutions or laws of the eleven revolted States which regulates the right of suffrage in elections for a convention, and why should Congress restrict it? Why are they *bound* to restrict it, when "the people of the several States" have not done so?

Thus it seems clear to us, viewed in every possible way, that Congress has absolute power to regulate the suffrage according to its will in the reconstruction of the revolted States, as an incident of its power and duty to guarantee to them a republican form of government.

This power may be exercised upon another ground. These eleven States, having justly forfeited their right to recognition by the United States, cannot return at any moment and claim a new recognition as an absolute right. The Federal power may properly impose terms and conditions of recognition. This Mr. Johnson has constantly assumed. He would not recognize any of the re-organized States until they had complied with, at least, *some* of his conditions. If it were true that a State has the absolute right, which some claim for it, to throw up its corporate existence, and to resume it at will, together with all the privileges of the Union, then Mr. Johnson's course during the summer of 1865 would be utterly indefensible. It would have been one long act of monstrous usurpation and tyranny. Mr. Johnson's supporters are estopped from taking any such ground. It is simply political suicide for him to deny the right of the Federal Government to impose conditions upon the return of the States to the privileges which they flung away. And the right to impose one condition being admitted, there can be no limit to the number of conditions. The President made it a condition that all should be allowed to vote for delegates to a convention who were qualified to vote for members of a legislature under the laws of 1860, provided they took a certain oath of his invention, and not otherwise. If the right to restoration was unconditional, where did Mr. Johnson get authority to prescribe that any person should or should not vote? It did not follow, necessarily, that one who was entitled under former laws to vote for an assemblyman was, therefore, entitled to vote for a delegate to a convention. Still less did it follow that no one could vote for the latter officer who could not vote for the former. Was Mr. Johnson's test oath to be found in any constitution or law, state or national? So he made it a condition of recognition that the Constitutional Amendment should be ratified, and, in some cases (for he had no uniform rule), that the war debt should be repudiated. How can his friends, in view of these facts, pretend that the South had any inherent, unconditional right to resume its place in the national councils?

The report of the Committee on Reconstruction, in the case of Tennessee, plainly shows that its members are convinced of the right of Congress to impose terms and conditions upon the revolted States. Eleven members of the committee have reported a bill for the restoration of Tennessee, upon condition that she shall maintain her existing franchise laws. Two other members report that equal suffrage ought to be made one of the conditions. Two oppose all conditions and restrictions.

If Congress has a right to require, as a condition of reconstruction, that a State shall not repeal an existing law, it must have a right to require that the State shall enact a new law. Such conditions have been repeatedly imposed upon new States.

It cannot be said that our doctrines on this subject would give Congress any right to interfere with the elective franchise in the loyal States, except, of course, by constitutional amendment. All we claim is, that when a State has voluntarily broken up its government, and abandoned all its rights in the Union, it cannot resume its place and its powers without the consent of the central Government, to be given upon such terms as the latter may see fit. We concede that it is the duty of Congress to provide for such restora-

tion, but affirm that the mode in which that shall be effected is entirely in the discretion of the legislature.

It follows that a simple act of Congress, passed in the ordinary way, might constitutionally provide for the reconstruction of the revolted States upon the basis of universal suffrage. No constitutional amendment is needed for the purpose. Congress might either offer this as a condition of restoration, or set the work of re-organization actually in motion, whether the late rebels chose to accept it or not. The latter method seems to us preferable, inasmuch as it would bring the whole matter to an issue at once, and would avoid all danger of the work being undone by an accidental defeat at an election, or by any new instance of the treachery of professed friends from which we have already suffered so much. Such a measure would, of course, be vetoed, but we trust it might be passed over a veto. We are confident that it would be sustained by the great body of those who were loyal during the war, when properly explained before the people.

THE TESTIMONY OF MR. STEPHENS.

Mr. Alexander H. Stephens is a man whose remarkable career, whose special abilities, and whose unequalled influence over the people of his State, entitle his opinions to serious consideration. His early political history has been almost forgotten in the fame of his later years, and it will not be amiss briefly to review it here.

Elected in the fall of 1843 to the House of Representatives, as a Whig, Mr. Stephens was continuously re-elected as long as he would consent to serve, which was until 1859. For the first five years of his membership he was considered an ultra Whig, and a particularly earnest friend of the Union. He voted against the annexation of Texas and the war with Mexico. His course during the struggle over the Wilmot Proviso, in 1848, was so liberal as to excite suspicion at the South of his soundness upon the slavery question. He did not, of course, vote for the Proviso; but he refused to join in any factious opposition to it. In 1849, however, he suddenly changed his mode of action, and, in conjunction with Mr. Toombs and one or two other Southern Whigs, defeated Mr. Winthrop's re-election to the Speakership, and entered fully into the factious proceedings by which the business of Congress was so much retarded in 1850. It was currently reported that Messrs. Stephens and Toombs made a direct effort to bully Gen. Taylor into submission to their plans, and were severely rebuked by him. However this may be, it is certain that they were in open opposition to that brave old man, who could never be coaxed or driven into any tolerance of the Southern schemes for disunion.

Mr. Stephens was never in favor of disunion for its own sake, and though he had given much encouragement to its advocates by his action during the lifetime of Gen. Taylor, he was content to accept the subserviency of Mr. Fillmore, and the Compromise of 1850, as a sufficient consideration for the continuance of the Union. On this platform he, Mr. Toombs, and Mr. Cobb, went before the people of Georgia, and the last named was elected governor by 18,000 majority over McDonald, the secession candidate. In the following session of Congress, Mr. Stephens finally renounced his connection with the Whig party, and ever afterwards acted with the Democrats.

In 1854, Mr. Stephens took a leading and decisive part in driving through the infamous Kansas-Nebraska bill. It had been so thoroughly entangled by the shrewd parliamentary tactics of its opponents that its passage seemed almost impossible. Mr. Stephens took the reins from Richardson (of Illinois), the regular leader, and in one day put it further forward than the combined wisdom of its other supporters had been able to do in two months. He has paid dearly for his sagacity since.

The part which Mr. Stephens took in the great drama of secession is familiar to all. Opposing the project with all his power, and in words of singular wisdom and foresight, he nevertheless yielded to the decision of his State, and gave a support to the now extinct Confederacy which was invaluable. But he soon lost confidence in his superior officer, and, although his peculiar position made it unsuitable that he should publicly oppose Mr. Davis, his views were well understood. He was anxious to bring about peace, and, it has always been believed, was willing to restore the Union upon certain conditions, whereas the great desire of Mr. Davis was to prevent its restoration upon any terms whatever.

It will be seen that Mr. Stephens's course has not been always consistent, and that his opinions have vacillated from one extreme to another, varying as widely as was possible for those of a Southern man in political life. This is not necessarily discreditable to him, but it does detract very materially from our confidence in his assurances as to what his constituents will or will not do. They may be neither so loyal nor so obstinate as he thinks, and he may again go with his State in either direction.

Mr. Stephens's statements before the committee are more worthy the name of argument than of evidence. Nearly all that he says, except in regard to the negroes, consists of his own reasoning upon mooted questions of law and policy. We do not find fault with this. The questions put by the committee naturally led him to do so. But we think the people of the North have but little inclination to accept Stephens's commentaries in place of Blackstone and Story.

The legal propositions of Mr. Stephens may be summed up as follows:

1. Each State is sovereign, and has a right to secede at pleasure.

2. Having seceded, every State has an absolute right to return to the Union at will.

3. The Federal Government has no power to impose any conditions upon the return of a seceded State.

4. "The validity of laws depends upon their constitutionality."

5. The constitutionality of laws passed by Congress in the absence of representatives from seceded States is very doubtful.

The fourth proposition, like a good deal more of Mr. Stephens's "testimony," seems to have been taken from the immortal Bunsby. As to the others, it surely needs no argument to prove that a Federal Union upon such a basis would be such a mockery of government as the world has rarely seen. We know of nothing to which it may be compared save to Milton's description of Sin, into whose womb her hideous offspring might return, and from which they might go at pleasure, regardless of her resistance or her suffering. The doctrine of simple secession we can understand, but this doctrine of secession and return at will is something too sublimated for our philosophy. Add to this the conception of a government of thirty-six States which is so paralyzed by the secession of any one that the validity of all legislation had in the absence of that one is doubtful, and our faith in the existence of government at all is seriously shaken.

It is possible that Mr. Stephens does not mean exactly this. It is, indeed, probable (for he is a sane and sober man) that he does not. Yet we have in no way misrepresented his language. The cause of his falling into such extraordinary nonsense appears to have been his confusion of Mr. Johnson's ideas of constitutional law with some of his own, whereas the two are wholly incompatible. The fact, however, that distinguished Southerners should thus in one breath assert their continued belief in the right of secession, and yet claim as indisputable their right to unconditional re-admission, is significant. North Carolina, which has (though by a minority of her people only) declared the ordinance of secession to have been *always* void, may with a good grace claim restoration as a right, however mistaken she may be in supposing that ordinance to be the only obstacle in the way. But from Georgia, which has simply *repealed* that ordinance, with the avowed purpose of recognizing its validity, such a claim is a little brazen.

We do not entertain any unkind feelings toward Mr. Stephens on account of his expressions of opinion, although some of them appear to us very ill-timed as well as unsound. But it is necessary to call attention to the incongruous mixture of Mr. Johnson's and Mr. Calhoun's views which is prevalent at the South, and to point out the endless absurdities which are involved in permitting States, which will not renounce the right of secession, to claim a *right* to unconditional and instant re-admission. We suggest to Congress that whatever else may be dispensed with, no State should be restored to its privileges until it has explicitly declared the ordinances of secession to have been always null and void, nor until it has ratified this declaration by a majority of all the voters in the State. Let us have no more such evasion as was

practised in North Carolina, where, on the same day that 58,000 votes were cast for governor, only 18,000 voted to annul secession.

Mr. Stephens's views upon the questions of *policy* are, that it would probably be inexpedient for Georgia ever again to secede, and that it would certainly be improper for her to assent to any further terms as a condition of restoration to State privileges. He would not personally object to the admission of a limited class of colored people to the right of suffrage, but thinks the people of Georgia would not consent to any such measure. He is quite willing that the negroes should have equal civil rights, and claims that Georgia has conceded these, and will not seek to revoke them. How much of this would have been done without external pressure he does not say, but common sense tells us. He urges the withdrawal of all such pressure for the future, but we regret to see nothing in the past which warrants a hopeful view of such a policy.

The testimony which Mr. Stephens bears to the good order and industry of the freedmen is honorable both to him and to them. It is radically different from the ordinary Southern view of affairs, and is given ungrudgingly. The negroes "are generally at work. There are some idle, but this class constitute a small proportion." Well done, negroes, to act so! And well done, Mr. Stephens, to say so!

FACTS AND OPINIONS ABOUT THE CHOLERA.

When the cholera was at its height in Paris, and the press teemed with remedies of every description, a shrewd resident observer wrote abroad:

"The result of this deluge of communications which drowns out the few sensible instructions of sober physicians, is simply pitiable. Besides stimulating fear by inspiring belief in the exaggeration of a malady against which it is thought necessary to employ such an arsenal of remedies, it happens that these remedies contradict each other, and the public is infinitely more disconcerted, and consequently more exposed, than if it had never been taught anything at all. It is bandied from the Charybdis of laudanum to the Scylla of sulphuric acid, passing through ether, hot and cold vinegar, diacodium, alcohols, cooling beverages, and what not! It is like losing the little sense and reason that is left us."

On the other hand, the great physician Velpeau, when accused at the French Academy of imprudence in countenancing the theory that the cholera is contagious, replied that he thought no harm would come of an honest endeavor to ascertain the truth. And on another occasion, in the same place, he remarked that no one ought to consider himself, if attacked, a lost man, even if there be no doctor at hand. No need to be alarmed on that account. Without a remedy, or specific, or treatment of any kind—nay, in spite of remedies—many patients recover, more than half are cured, and by the most opposite means.

Reviewing the various discussions of the cholera which have occurred during the last six months on both sides of the Atlantic, we cannot but observe much of that confusion which is the twin sister of panic. In the present article we propose to lift out of this confusion a few conclusions which seem to be derived from an unusually large range of observations or to bear the impress of common sense.

While there is no habitable spot in our latitude to which the cholera may not penetrate, and no asylum, therefore, which is absolutely secure from its approach, it has, nevertheless, a tolerably definite range by reason of its decided preferences. According, then, as the subsoil is loose and porous or rocky and compact, the disease will be likely to rage with great or comparatively little violence. The limestone region of Ohio will suffer far more than the sandstone valley of the Scioto. Malarious districts, favorable to fever and ague, will be especially exposed. For these reasons New England will fare much better than the South and West. The cholera will haunt the level of bodies or streams of water, and the stagnant pools along their banks. On the Thames it was observed to prevail much more extensively below than above the point where the sewers discharged themselves. It will be found not far from all putrefying exhalations and all collections of filthy refuse. In the country it will follow the lines of public travel; in cities, the lines of streets; on shipboard, the various divisions of steerage, cabin, and deck.

As to whether the cholera is contagious, infectious, or simply epidemical, and so far capricious in its attacks, there is the greatest diversity of opinions, partly arising from a want of precision in using the terms in question. M. Velpeau, as already remarked, referred with respect to some observations of Dr. Raimbert, which tended to prove the transmission of the disease by bodily contact through a chain of six or seven persons. But this is contrary to the almost universal belief. Dr. Snow, Superintendent of Health in Providence, pronounces it the work of supererogation to attempt to prove that it is not contagious. In 1854 no physician, clergyman, or colored person took it in Providence. The consulting physicians of Boston unite in so strong a statement as that cholera is neither infectious nor contagious, and cannot be propagated by being near the sick *nor by handling the secretions or excretions* from the bodies of the sick or dead. It is almost invariably assumed, as a consequence of this belief, that quarantines or sanitary cordons of any sort are useless; but we apprehend that the following proposition, by Dr. Felix Niemeyer, of Tübingen, Germany, contains a juster view of the case. He says:

"It is, on the one hand, certain that cholera is not communicated directly from one person to another, even under circumstances of the greatest intimacy; but, on the other hand, it is as certainly spread only by patients afflicted with the disease."

With this help it is not difficult to explain why the cholera selects the great routes of travel; why its advance from place to place is no faster than a man may journey the same distance—a fact which Eugene Sue improved as the "motive" of his "Wandering Jew;" why its pace has been quickened since the introduction of railroads; why the common atmosphere of a ship does not ensure the sickness of all the passengers; and other similar problems. Quarantine, therefore, has its uses, but, of course, entire dependence cannot be placed upon it; and M. Chevreul has well remarked that, for scientific and prudential reasons, it is advantageous to consider the cholera contagious, and, as much as possible, to isolate patients afflicted with it.

The same doubt hangs over the nature of the poisonous principle of the cholera as of the Rinderpest. We will not stop to enquire vainly whether it be organic or inorganic, but rather who are most susceptible to its influence. Dr. Hamlin, missionary of the American Board at Constantinople, notes from a large experience that three-fourths of the attacks proceed from improper diet, the use of intoxicating drinks, or both. The rest are superinduced by suppressed perspiration, excessive drinking of cold water, great fatigue, anxiety, or positive fear. In short, the intemperate (in the legitimate sense of the word) are the chief sufferers. Speaking generally, the infirm are attacked rather than the strong and healthy, the aged rather than the middle-aged, misery and want rather than ease and abundance, timidity rather than self-possession. The best prophylatics, then, are strict temperance, wholesome food and proper clothing, uncrowded residences and lodgings, personal and household cleanliness, and composure of mind.

Before deciding on a course of treatment, it is well to ascertain, if we can, the medium of contagion—and if we avail ourselves of this word on the authority of Dr. Niemeyer, it is only in order to define it as he understands it, following other investigators. He considers it established that evacuations propagate the cholera; and by referring to the phenomena enumerated above as inexplicable, except by admitting that the disease is carried from place to place by human agency solely, it will be seen how exactly the two theories complement each other. The steerage having a common sink—a row of houses having a common sewer—it is clear why when a single passenger or a single inmate is attacked with diarrhœa, the whole steerage, the whole house, and ultimately the entire block or street, will become infected. Clear, also, why the cabin and crew, having separate sinks, escape; and why an adjacent street is untouched. Clear, again, why conveyances by water do more to spread the cholera than those by rail. Clear, that quarantines and *cordons sanitaires* have a measurable value. The poison, be it added, is at first latent in the evacuation, but develops in the vicinity of putrid animal and vegetable matter and on soils already described. Hence two very important injunctions: to avoid strange privies, and to separate from those in ordinary use the discharges of cholera patients. Those of public conveyances should be frequently and thoroughly cleansed, and in the receptacles of all such as are fixed a solution of copperas or some other disinfectant should be poured at intervals.

Sudden attacks of the cholera are rare. Generally they are preceded by a characteristic trouble in the digestive functions, the circu-

lation, etc., to which the name of cholerine has been given. These gastric disorders mark the gradual working or incubation of the poison, but the period varies from one to ten days. The symptoms of the decisive attack are diarrhœa and, in the severer cases, vomiting. Then it is well to act speedily, if at all.

And how act? The reader awaits, perhaps, an account of the countless answers to this question. But no; there is a general agreement that the first act should be inaction. Go to bed, rest quietly on your back, keep warm. Drink hot coffee or hot tea, adds Dr. Niemeyer; a vigorous sweat often wards off the cholera; but do n't check perspiration too suddenly. For cramps in the legs, use kneading and friction. To allay the extraordinary thirst which attends the insupportable drain on the fluids of the system, the throat may be gargled, the mouth washed out, or moistened with a teaspoonful of gum-arabic water, or the patient may be fed with small quantities of ice-water, or small pieces of ice almost *ad libitum*.

How to arrest the incipient or prodromatic, and how the confirmed, diarrhœa? It is here that the doctors begin to differ. Dr. Hamlin's method employs laudanum, and, besides having had currency in our newspapers, has just been published in Boston in a tract form, and hence is easily obtainable. Dr. Niemeyer is likewise an advocate of laudanum, but distrusts sinapisms. Dr. Worms, head physician in the military hospital of Gros-Caillou, doubts the efficacy of opium, and impersonates the Scylla to which the French public was tossed from the Charybdis of laudanum. He makes what he calls a mineral lemonade, by mixing from two to four grammes of concentrated sulphuric acid with one thousand grammes of pure or mucilaginous water and one hundred and fifty grammes of syrup, pure or flavored with raspberry. Of this he administers a glassful every hour, rinsing the patient's mouth two or three times after drinking. Rarely, he asserts, are four glasses needed. When the cholera has fairly taken hold, from five to ten grammes of the acid are added to a litre of water, and given every half hour, a glass at a time, and immediately after vomiting. Ice at discretion. No harm will ensue if the dose increases the vomiting.

A physician of the Royal Infirmary at Southampton, England, communicated to the *Times* a still simpler mode of treatment. This consisted of a hip-bath of hot, almost scalding, water containing three-quarters of a pound of powdered mustard—the patient having also his feet in a similar bath with only a quarter of a pound of mustard. Milk-and-water with lumps of ice was allowed to be taken, while in the bath, in any quantity; alternating with ice alone. In half an hour the patient was put to bed with hot tins on his hands and feet, and well covered up with blankets. After the reaction he was fed with plenty of weak broth and iced milk. Dr. Hamlin enumerates ice-water, chamomile tea, arrowroot, crust-water.

A typhoidal state often ensues to protract convalescence; but for this careful nursing suffices, care being taken to avoid too much drinking.

In the appendix to Mr. Catlin's curious pamphlet, "The Breath of Life," the author says:

"From the observations, with their results, on board of a mail steamer, given on a former page, together with numerous others of a similar nature, made whilst I have been in the midst of yellow fever and the cholera in the West India Islands and South America, I conscientiously advance my belief, that in any town or city where either of those pestilences commences its ravages, if that portion of the inhabitants who are in the nightly habit of sleeping with their mouths open were to change their residence to the country, the infection would soon terminate, for want of subjects to exist upon.

"This opinion may be startling to many; and if it be *combated*, all the better; for in such case the important experiment will more likely be made."

HISTORIC DOUBTS ON WILLIAM IV.

Jesting Pilate might well ask, "What is truth?" if he had made a study of history in its details. And Sir Robert Walpole, after "he had sunk," like his great rival Pulteney, "into insignificance and an earldom," might well tell his son Horace to read to him anything but history, "for that must be a lie!" One would think that all the particulars of so momentous an event in the history of England as the passing of the Reform Bill might be known with an absolute knowledge, if any past facts can be so established. Several of the actors in that great drama, including the present Prime Minister and the Lord Chancellor of the reform ministry, yet survive, and all were living, friends and enemies of the act, within a very few years. The testimony of Lord Grey, the Duke of Wellington, Lord Lyndhurst, Sir Robert Peel, of all the household of William IV., might have been had from their own lips by any man forty years old, and the occurrences of that momentous time recorded with photographic accuracy. And yet we have diametrically opposite accounts of the way in which the very cardinal act on which the great measure turned at its most critical instant was brought into play.

The dissolution of the first Parliament of William IV. on the 22d of April, 1831, was actually the crisis of the reform movement. The Tory party in the House of Commons had defeated the Grey ministry on the 19th on the motion of General Gascoigne that the number of the House ought not to be reduced. Before that the second reading of the bill had been carried, but by a single vote in the fullest House ever known. And on the 22d, by a majority of 22, the House refused to go into committee of supply. The question on which the destinies of England depended for the time was, whether the King would consent to dissolve Parliament. He was known to be most reluctant to do so, and in this reluctance he was most passionately supported by the whole force of the Tory party, which had a great preponderance in the Lords. If he dissolved and "recurred to the sense of his people," to use his own words, and if the sense of his people was pronounced in favor of the reform bill, he would be bound to obey it, even at the expense of swamping the House of Lords, if they should resolve obstinately to place themselves across the course of reform—a necessity which he did actually have to encounter the next year, when a list of eighty persons was made out to be raised to the peerage for the purpose of overcoming the hostile majority in the Upper House. Though the personal influence of the King induced a sufficient number of the Tory lords to absent themselves when the vote was taken, the precedent was established and the principle fixed that the House of Lords must give way when the people were resolute to carry any measure of reform, however odious to their lordships. It was, in fact, a revolution—bloodless, indeed, but compelled by the fear of bloodshed, and which the King might well hesitate to precipitate or to permit, if he could hinder.

Of course, the refusal of William IV. to dissolve his first Parliament would not have stopped the reform bill. It would have been carried over his head as well as over that of the House of Lords, if he had tried to block its progress. But it would have been carried in a different way from that in which it was accomplished. The English people were in a revolutionary state at that time, and would not have permitted the palace any more than the House of Peers to stand in their way. It is happy for constitutional governments everywhere that this revolution was effected by strictly constitutional means. So the history of how the King conducted himself in such an emergency becomes deeply interesting. And here the discrepancy begins. Mr. Molesworth, in his history of the reform bill, gives a version of the circumstances attending the dissolution which he states he received from Lord Brougham himself. According to this very picturesque account, the question of dissolution had not been considered definitively by the Grey cabinet until the morning of the 22d April, after the refusal of the House of Commons to go into committee of supply. Then a council was held in such haste that even the great "breeches question" was slighted, and they met, most appropriately, *sans culottes* to meditate their revolutionary plans. It was unanimously determined that Parliament must be dissolved at once. But who was to manage the King? Lord Grey shrank from the interview, and Lord Brougham had to undertake to bell the cat. The Chancellor found the sovereign, whose conscience he had in his official custody, extremely ill-disposed to comply. He was assured that he must do so, or take the responsibility of calling in a new ministry, and of the popular commotions that might follow. His Majesty yielded to the necessity, but fell back on what lawyers call dilatory pleas. Who was to carry the sword of state at so short notice? The cabinet had ventured to give the necessary orders. This was bad enough, but worse remained behind. "Who was to order out the Life Guards? It was too late to give the orders." The Chancellor most humbly informed his Majesty that the ministers had taken that

responsibility, too. "Why, this is treason! And you, my Lord Chancellor, ought to know that it is!" "Yes, sire, I know it, and nothing but the strongest conviction that the Crown and the best interests of the nation are at stake, could have induced us to take such a step." In brief, the Lord Chancellor gained the victory, and led the sovereign in triumph to the scene of action.

This statement the present Earl Grey, the Lord Howick of those times, not unnaturally thinks little flattering to the memory of the King or his late father, whatever it may be to the vanity of Lord Brougham. He accordingly makes his statement, in all important points sustained by documentary evidence. The question as to the dissolution of Parliament came up in the cabinet on the 20th, in consequence of the vote on Gascoigne's motion the night before. The cabinet recommended it. The King took it into consideration and communicated his objections in writing, but yielded to the advice of his ministers. The dissolution was agreed upon, only the time was not fixed, as it was desirable to get some money-bills through the House first. The action of the House on the 22d, virtually stopping the supplies, hastened matters. And, it may be added, the address to the King, proposed by Lord Wharncliffe, in the House of Lords, remonstrating against the exercise of his unquestionable prerogative of dissolving Parliament, has always been supposed to have been strong provocation to the King to employ it without delay. Lord Grey appears to have shrunk from no interview, but to have done his duty regularly and properly. The King seems to have acted with dignity and good sense, and Lord Brougham is nowhere to be seen. It was a memorable day in parliamentary history. The House of Lords as well as that of Commons was the scene of almost riotous disturbances. The Earl of Mansfield refused to stop speaking when the King appeared, and was pulled down into his seat and held there, while Sir Robert Peel, in the Commons, had also to be suppressed by his coat-tails for refusing to take his seat when the Usher of the Black Rod appeared to summon the House to the royal presence. Lord Campbell says of the scene: "Never shall I forget it—it might well convey an adequate idea of the tumultuary dissolutions of the times of the Stuarts. The most exciting moment of my public life was when we cheered the guns which announced his Majesty's approach." Lord Brougham's story is the more entertaining; but Lord Grey's is the more probable, and what one would prefer to believe as most honorable to the great statesman and to the Sailor King. In these days, when we have been stripped of so many striking sayings of famous men through the mousing industry of historic infidels—such as Wellington's "Up, Guards, and at 'em!" and Cambronne's "The Guard dies, but never surrenders!"—it were pity to lose the sailor-like exclamation of William IV. when there was some delay about the royal coach to go to the Parliament, "D—n the state-coach! call a hackney-coach!" It was believed at the time, and made him immensely popular.

THE MORAL OF THE CAR-DRIVERS' STRIKE.

The strike of the car-drivers, which ended, as such things are apt to do, in leaving both parties somewhat worse off than ever, affords an excellent illustration of the way in which the popular common sense disposes of all social movements which have no sound or substantial basis. The car-drivers had a perfect right to strike for higher wages, and the companies had a perfect right not to give higher wages, and to employ new men in the place of the old ones. But the old ones acted as if they really had a vested right not simply to their places, but to their places with such wages as they might themselves be pleased to fix. They accordingly assembled in great crowds at the termini of the roads, hooted and jeered the men who had ventured to take their places, threatened them with vengeance, and in some few cases proceeded to acts of violence. This intimidation was, of course, tolerably effective. Very few men will accept employment if they fear that their doing so will lead to their being mobbed the minute they leave their work. The companies were accordingly obliged to draw off half or two-thirds of their cars, to the terrible inconvenience of the public. With this the public very reasonably found fault. The differences of the corporations with their servants were no affair of the passengers, and furnished no excuse for not keeping the cars running at whatever cost. But, curiously enough, when the companies attempted to do their duty by having the cars driven by new men, they were assailed fiercely by the newspapers and a portion of the public, because the police were employed in the perfectly legitimate function of protecting honest men threatened with mob violence in the pursuit of an honest calling. More than this, they were assailed fiercely because they did not give the drivers whatever they pleased to ask as wages, not because the latter were receiving anything less than the market rate, or, in other words, what their labor was worth, but because the companies had failed to do their duty to the public. The principle on which the outcry was based would in fact justify the cook of a broker who had behaved badly in Wall Street in suddenly refusing to serve up his dinner under ten dollars, and, if discharged, in passing her time on the sidewalk hooting at her successor through the basement windows.

However, in spite of their uproar, and in spite of the sympathy for the movement expressed by the public and a large portion of the press, it died out very soon. The drivers went back to their work at their old wages, and the story of their grievances was heard no more. In fact, beyond causing some inconvenience to old persons, invalids, and lazy people, it made hardly a ripple on the surface of society, although it involved the turning loose of some 1,500 not particularly well-mannered men to inveigh against the tyranny of capital in the midst of one of the most excitable, and, as we saw in 1863, when excited most dangerous, city populations in the world. And the reason why such movements make so little commotion is, that under all the froth and foam of our political and social agitation there lies a stratum of sound common sense—the common sense of the mass of the people who neither spout on platforms nor write letters to newspapers, and which silently condemns and consigns to future oblivion all untenable claims and crazy theories and impracticable schemes. When a good and sound reform is proposed, it seizes on it and embodies it in opinion or in legislation with marvellous rapidity. But let orators or newspapers shout ever so loudly for things that neither the constitution of society nor the existing condition of human nature will admit of, or legislatures make ever so much haste to bring in bills upon it, the unseen popular instinct, the popular sense of the absurd, coldly passes sentence on the movement, it becomes a laughing-stock, and in a few days dies out.

THE POWER OF THE PRESIDENT TO REMOVE FROM OFFICE.

Everybody knows what a fertile source of corruption "rotation in office" is, how much it has done to debase our political life, and how rapidly it tends to exalt the executive above every other branch of the Government; to weaken the force of public opinion, and to fill the public service not with public servants, but with bands of adventurers, whose first allegiance is due to the party chief, and to whom "the country" and "the people" are but names to be used on the stump for the delusion of the honest and simple-minded voters. The evil is every year increasing, because the number of office-holders is increasing, and the work they have to do becoming more complicated. If the Union continues to grow as it is growing now, and no means is taken to bring officials into real dependence on the public, whose bread they eat, the President will before long find himself at the head of a large army of hirelings devoted to his will, and he will use them in such a way as to convert elections into a farce, and to make the very name of public morality a laughing-stock. The custom-house, and post-offices, and all other branches of the service, except the army and navy, are already in a most discreditable condition. The meddling of the officials in elections is a great scandal; but nothing that we have yet seen can even give us an idea of what our children will see, if we leave the President much longer in possession of that power over the bread of public servants which he now exercises.

The public has submitted to it hitherto partly because the Federal officials were, prior to the war, a comparatively small and unimportant body, and partly because it has been generally believed that the power of removal from office without cause, as exercised by the President, was a constitutional one of which there was no means of depriving him except by an amendment, which none of the great political parties would have the virtue or the courage to propose or carry.

Colonel James A. Hamilton has undertaken to expose the error on which the popular submission to the exercise of the power of removal by the President is based, in a pamphlet which lies before us. It was, we believe, written and printed five years ago, shortly before the outbreak of the war, but was withheld from circulation when the storm burst. There was little chance of attracting attention to reforms in the government as long as its very existence was at stake. But the war, which temporarily consigned the question to the shelf, has, now that it is over, bequeathed it an importance which

in 1860 it was far from possessing. Recent events have only increased its interest. It remains still to be seen whether the President will use his power over office-holders to close the mouth of the national legislature, and the eagerness of such creatures as Postmaster Cleveland to do his will only shows how faithfully he would be obeyed if he did.

We purpose making such extracts from Colonel Hamilton's pamphlet as will enable him to tell his own story, and we regret that we cannot publish it entire; but neither can we condense it, as the argument is nakedly legal.

If the Constitution confers this power upon the President alone, either directly or by necessary implication, it is a power beyond the control of Congress, it cannot be directed, limited, or abrogated, and yet we find that in May, 1820 ("Gordon's Digest," page 24, article 195), an act was passed declaring that the term of office of collectors, district attorneys, and others should be limited to four years.

The contemporaneous history of the Constitution is against the assumption that this power was conferred on the President *alone*.

No. 77 of the "Federalist," written by Hamilton: "It has been mentioned as one of the advantages to be expected from the co-operation of the Senate, in the business of appointments, that it would contribute to the stability of the administration."

"The consent of that body *would be necessary to displace as well as to appoint*. A change of the chief magistrate, therefore, would not occasion so violent or so general a revolution as might be expected if he were the sole disposer of offices."

Mr. Webster says: "The unlimited power to grant office, and to take it away, gives a command over the hopes and fears of a vast multitude of men. In the main it will be found that a power over man's support is a power over his will. When favors, once granted, may be withdrawn at pleasure, there is ordinarily little security for personal independence of character."

"The power of giving office thus affects the fears of all who are *in* and the hopes of all who are *out;* those who are *out* endeavor to distinguish themselves by active political friendship, by warm personal devotion, by the clamorous support of men in whose hands is the power of reward, while those who are *in* take care not to be surpassed in such qualities or conduct as will secure favor."

"The consequence of this is, that a competition ensues not of patriotic labors, but of complaisances, of indiscriminate support of executive measures, of pliant subserviency, and gross adulation."

"The patronage of office, the power of bestowing place and emoluments, creates parties not upon any principle or any measure, but upon the single ground of personal interest, and thus they form round a leader and go for the spoils of victory; if the party chieftain becomes the national chieftain, he is apt to consider all who oppose him as enemies to be punished, and all who have supported him as friends to be rewarded."

"Blind devotion to a party, and to the head of a party, thus takes the place of the sentiment of genuine patriotism, and a high and exalted state of public duty."

In order to a clear understanding of this subject, we proceed to present the various clauses of the Constitution touching it:

By article 2, section 2, clause 2, it is provided "that the President shall nominate, and by and with the advice and consent of the Senate shall appoint, ambassadors, other public ministers, and consuls, judges of the Supreme Court, and all other officers of the United States, whose appointments are not herein otherwise provided for, and which shall be established by Congress; but the Congress may by law vest the appointment of such inferior officers as they think proper in the President alone, in the courts of law, or in the heads of departments."

The following analysis of this clause will show what power the President has under it:

1st. It gives the President power to nominate (this is exclusive).

2d. With the concurrence of the Senate, "to appoint."

3d. What officers? "Ambassadors, other public ministers and consuls, judges of the Supreme Court, and all other officers of the United States, whose appointments are not *herein* otherwise provided for."

4th. What offices are otherwise provided for by the Constitution?

(1.) Members of the House of Representatives.

(2.) Senators.

(3.) Electors of President and Vice-President.

(4.) The President and Vice-President of the United States.

(5.) The Speaker and other officers of the House of Representatives.

(6.) A President *pro tempore* and other officers of the Senate.

5th. The President has power, with the concurrence of the Senate, to appoint [to?] "all other offices" which shall be established by law. He cannot create an office by making an appointment or otherwise, because "all other offices must be established by law."

6th. "Congress may by law vest the appointment of such *inferior officers* as they think proper *in the President alone*, in *the courts of law*, or in the *heads of departments*."

It will be admitted that, under this branch of this clause, the President alone can appoint only such inferior officers as the Congress may authorize him so to appoint.

Any other appointments made by him alone, or which are given to the courts of law or the heads of departments, would be a violation of the Constitution and the laws.

It thus appears that in every case where the Constitution gives the President power to appoint, it must be with the concurrence of the Senate. (Congress may give him power to appoint "inferior officers.") We except temporary appointments, which will be hereafter mentioned.

If the power of removal is incident to, or a consequence of, the power of appointment, it is very certain that as the *incident* cannot be more extensive than the *principle*, the power of removal must be as limited and qualified as is the power whence it is derived; and consequently, as the power of the President alone to appoint is limited to "inferior officers," and is only conferred by act of Congress, the power of removal does not extend to others than "inferior officers," and must always depend upon the action of Congress, so also the power to remove in all other cases than "inferior officers" (authorized by act of Congress) must be with the concurrence of the Senate.

But whence comes the power *to appoint* when the Senate is not in session, and the consequent power thereby to remove?

It is certainly without the authority of the Constitution or the law.

It will be said that such appointments and consequent removals during the recess are made by authority of the 3d clause of article 2, section 2, which is in these words:

"The President shall have power *to fill up all vacancies that may happen* during the recess of the Senate, by granting commissions which shall expire at the end of their next session."

Most certainly this cannot be properly said, because the clause only authorizes the President to grant commissions to fill up vacancies, whereas, in the supposed case and in practice, he grants a commission to make a vacancy.

Again—This clause only authorizes the President to fill up vacancies that "*may happen*" during the recess.

What is the meaning of the words "*may happen?*" They mean such vacancies as result from some "accidental occurrence," "without previous expectation," and certainly not by direct removal or by an appointment which creates a removal. Such an act is *premeditated*, and wants every quality of an "accidental occurrence."

In the last case there is no vacancy, and in no sense can a vacancy by removal be said to *have happened*—that is, to be a casualty. Vacancies by casualty might occur during the recess, and it was, therefore, necessary to provide for such vacancies by temporary appointments.

It may be remarked that, when this clause was formed, the convention had the subject of vacancies under consideration, and if they had supposed it possible that there could be a vacancy by removal during the recess, they would have made provision for it, or have applied this clause to it, by saying "or by removal" after the words "may happen."

From these considerations it may be confidently asserted that there can be no appointment to a vacancy occasioned by removal during the recess.

And that all appointments made to fill vacancies occasioned by removals, if such there be, are unconstitutional and void.

There is no power in Congress, in the Senate, or in the President to sanction such appointments.

As to the true meaning of the words "*may happen*," we refer with the utmost confidence to No. 77 of the "Federalist."

Article 1, section 3, clause 2, declares: "If vacancies *happen* by resignation or otherwise, during the recess of the legislature of any State, the executive thereof may make temporary appointments until," etc. The author says: "Here is an express power given in clear and *unambiguous terms* to the State executives to fill '*casual vacancies*' in the Senate by temporary appointments."

We have also the authority of the same author—Alexander Hamilton—in a letter written by him to James McHenry, Secretary of War, dated May 3, 1799 (ten years after the debate in Congress on the subject of removals), in which he says: "In my opinion, vacancy is a relative term, and presupposes that the office has been once filled. If so, the power to fill a vacancy is not the power to make an original appointment.

"The terms, which *may have happened*, serve to confirm this construction. They imply casualty, and denote such as, having been once filled, have become vacant by accidental circumstances." . . . .

"It is clear that, independently of the authority of a special law, the President cannot fill a vacancy that happens during the session of the Senate." ("Hamilton's Works," vol. 5, page 258.)

It is thus made quite clear that this clause does not authorize the President to grant a commission to fill a vacancy caused by removal, because that is not a vacancy by a "casualty," and that he has not the power to grant a commission which by appointment creates a vacancy, because that is not exercising the power to fill a vacancy which has already happened.

If the President has the power to create a vacancy by removal during the recess, he can have no power to fill up such vacancy, under this or any other clause of the Constitution.

The following conclusions are advanced as inevitable and invincible:

The President, if he possesses the power of removal, cannot exert that power by making an appointment during the recess.

If the power of removal results from the power to appoint, there can be no removal by the President alone during the session of the Senate.

If the President alone has the power to *remove* other than "inferior officers," the vacancy occasioned *thereby* must continue until the session of the Senate, because he has no power to appoint without their concurrence, except in the one case, to wit: to *fill a vacancy* which *may happen*—that is, which is the consequence of an "accidental occurrence."

These are all logical and safe deductions from the various provisions of the Constitution—whether the power of removal by the President alone be granted to him by article 2, section 1, clause 1, or whether it results from the power to appoint.

We call upon those who entertain the opinion *that removal is an executive power, conferred by the above clause*, to show whence is derived the power of the President to make *an appointment*, to grant a commission, to fill a vacancy so made.

In the first place, if this clause had been intended to be a grant of power, the Convention, governed by that wise forecast which distinguished them,

would have declared, "All executive power, *not otherwise conferred or denied* by this Constitution, shall be vested in a President of the United States."

When the illustrious men who assembled to perform that great work, "a Constitution of government for the people of the United States," [were met?] their first effort in "arranging a system of organization" was to decide how many and what departments there should be.

They decided that there should be *three great departments:* The legislative, the executive, the judicial. And, as next in order, their constituent parts, the mode of their choice, and their respective powers; and in doing this they had to deal with every variety of suggestion and opinion.

The system of organization having been thus completed, they proceeded to declare:

Art. 1. "All legislative powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives."

Art. 2. "The executive power shall be vested in a President of the United States of America" (not "all executive power *herein granted*," as in the case of the legislative).

Art. 3. "The judicial power of the United States shall be vested in one Supreme Court, and in such inferior courts as the Congress may from time to time ordain and establish."

This done, they proceeded in each case, and under each article, to declare specifically and in detail what powers were conferred on each department, and what were denied.

This allotment and detail of powers prove that the first article in each case was intended as a mere designation of a department, and not a grant of power to either of those great departments.

It is very certain the assumption that these articles were to be considered as granting, or as intending to grant, powers, would have made the Government, instead of it being, as it is, one of precise and delegated powers, one of an unlimited character, and particularly would this be the case as to the Executive, in regard to which the people entertained a morbid sensibility, and indulged an unreasonable jealousy.

On examining the detail of powers given and denied to the respective great departments, many of those which are universally recognized as executive powers are expressly conferred on the legislature.

The power "to declare war, to coin money and regulate the value thereof;" while the power to make treaties, to appoint to office, clearly executive powers, are given to the President, together with the Senate; on the other hand, the President has the unqualified power to receive ambassadors and other public ministers, to commission all officers; with one exception, to grant reprieves, and pardons for offences against the United States; to command the army and navy of the United States and the militia of the several States when called into the service of the United States; to require the opinions in writing of the heads of departments; to see that the laws are faithfully executed; on extraordinary occasions to convene both Houses or either of them, and in case of disagreement to adjourn the legislature. He has also a qualified veto.

In this enumeration of executive powers, some so very unimportant, we do not find that "dangerous power" of removal, as Mr. Madison calls it.

Can it be supposed that this was a careless omission?

The attention of the Convention was directed to one case of removal, by impeachment; it was directed to vacancies during the recess, and yet the vast power of removal by the President alone, we are told, was left to inference, to construction; and yet vacancies, occasioned by its exercise during the recess, are not to be filled until the session of the Senate.

It is surely much more reasonable to believe the Convention intended that the only removal by the President could be made by appointment, by and with the advice and consent of the Senate.

It is well known that there are other powers, as clearly executive as is that of removal, which are not conferred or denied by the Constitution, to wit:

The power to *grant charters of incorporation to cities and towns, and to associations of individuals, for the purposes of trade and commerce,* and also the power to establish "fairs and markets" (see "Blackstone's Commentaries," "*Prerogative*"), which by the same rule of interpretation must be "vested" in the President, as well as that of removal. Why not?

The argument is: the power of removal is an executive power; as all executive powers not given or denied are vested in the President by article 2d, this power of removal, the power to grant charters, the power to establish "fairs and markets," and all other executive powers, are also vested in him alone.

It is not to be believed that the advocates of this latitudinarian construction will be willing to push their opinions, at this time of day, to their legitimate and logical results.

In No. 69 of the "Federalist" there will be found an enumeration of the powers of the President, and a comparison of these with those of the governor of New York and of the king of Great Britain.

The power of removal by the President alone is not found in this enumeration, but the power to "erect corporations, with all the rights incident to corporate bodies," and to "establish fairs and markets," are referred to as clearly defined executive powers, not given to the President.

The inference is a strong one that all executive powers, if any, not denied or elsewhere conferred, are not vested in the President by the clause now under examination.

No part of the Constitution was so unscrupulously assailed during the discussion before the people, or in their conventions, as was the executive power.

And as far as our researches have extended we do not find that this dangerous power, on this unlimited and dangerous construction of the Constitution, was ever hinted at as being vested in the President, or as having been supposed to be.

Influenced by these considerations, we are compelled to believe that, in the arrangement of the system of organization by the builders of "The Great Temple of Human Liberty," the clause referred to was intended to be a mere designation of the executive office, and was in no respect to be deemed a grant of power.

If this be so, there remains no ground whatever on which to rest this claim of power, a power which, in its practical operation as exercised since 1829, has tended more to degrade the parties and politicians of our country than all other powers or practices.

It has essentially thrown all the offices of the Government into the arena of party, to be scrambled for and clutched as "the spoils of victory" by the most unscrupulous demagogues and knaves.

The power of removal was not known to have been used until 1829 to reward or punish party services or offences. The whole number of removals during *forty years*, from 1789, did not exceed seventy-three, more than half of which were made by Mr. Jefferson, as we learn from Parton's "Life of Jackson." He further says, referring to the removals in 1829: "The estimate of 2,000 includes all who lost their places in consequence of General Jackson's accession to power; and though the exact number cannot now be ascertained, I fear it will not be less than 2,000."

Admitting that the decision of 1789 and that the law of 1820 distinctly recognize the power of the President alone to remove, and that the Constitution, by article 2, vests this power in him, we aver that those laws and this article cannot confer upon the President *alone* the power to make an appointment or to grant a commission, because both of these powers are expressly provided for by article 2, section 2, clauses 2 and 3.

If the advocates of this executive power shall insist that the power of removal draws after it the power to appoint, they must admit that the power given to the Senate to remove by a sentence, upon the trial and conviction upon impeachment, gives that body the power, in such cases, to appoint.

The potency of removal, in the last case, must be equal to that of the former. Both are absurd.

If removal is an undefined power it might be reached under clause 16 of section 8, article 1, which gives the Congress power "to make all laws which shall be necessary and proper for carrying into execution the foregoing powers" (all powers enumerated in that section), "and all other powers vested by this Constitution in the Government of the United States, or any department or officer thereof."

Removal is a power vested by the Constitution in the Government.

If it is not included in the power of appointment (we think it is), if it is not vested in the President by article 2, which assumption we are confident cannot be sustained, let an act be passed declaring that the President shall have power to suspend any officer during the recess, for cause, and to appoint another in his place until the end of the next session of the Senate; and, whenever the Senate shall be in session, he shall nominate the person so temporarily appointed to the Senate, or some other, and with their advice and consent shall appoint him to office, and with such nomination he shall state the cause for such suspension; and further, that whenever the President shall nominate to the Senate a person to fill a place thus occupied by another, he shall give his reasons for the removal of such incumbent.

This course, while it would afford to the President all the power necessary to enforce the laws, would secure officers against the exercise of a selfish or capricious control.

Suspension and removal, being exceptional and for cause, would be considered disgraceful, whereas the existing practice of removal for opinion's sake removes all idea of disgrace.

The stability of administration would be secured, and the public would be much better served.

But, above all, the hope of spoils being blasted, the sordid, selfish, and degraded demagogues would be compelled to seek their bread by some other employment.

RESULTS.

First. The Constitution has not vested the power of removal in the President *alone*, expressly or by necessary implication.

Second. The second article is not a grant of all executive power not denied or given elsewhere.

Third. The power of removal is embraced by and results from the power of appointment.

Fourth. If the power of removal is vested in the President, he has no power to appoint during the recess, in order to fill a vacancy occasioned by the exercise of that power.

Fifth. The President has no power to make an appointment or issue a commission during the recess, except "*to fill a vacancy*" occasioned by an "accidental occurrence."

Sixth. Removal by the President, if he has the power, does not create a vacancy which he can fill by granting a commission during the recess.

Seventh. If the power of removal is not vested by the Constitution in the President alone, the Congress has power to repeal all laws now existing which affirm or admit such a power, and to declare that it is a power resulting from the power of appointment, to be exercised with the concurrence of the Senate.

SAISON DES SEMAILLES. LE SOIR.

FROM VICTOR HUGO'S "LES CHANSONS DES RUES ET DES BOIS."

TWILIGHT begins:
Hid in a sheltering arch, I sit and wait,
And see, how from the day which hurries, late
Brave Labor, on the threshold of the gate,
One more hour wins.

Far down the field,
Dew-bathed, I see, with fluttering rags and feeble hand,
An aged man, who casts into the furrowed land
Handfuls, in which the harvest time has hid and planned
Its future yield.

His shadow black,
Gigantic, walks beside him through the dust,
Like master! Oh, how well the sower must
Believe, that days fly freighted with no idle trust,
And turn not back!

While to and fro
He journeys, patient, on the lengthening plain,
I watch, unseen, the showering of the grain;
And, as he fills his hand, and sows again,
I marvel how,

With subtle jars
Of rustling sound, the shadow, fold by fold,
Spreads up its wings, until the sower's bold
And solemn motion seems to lay its hold,
Upon the stars.

H. H.

M. LABOULAYE'S ELECTION.

THE last discussion in the French Parliament has been followed by a most interesting incident. You remember, probably, that for the first time since the establishment of the Empire some members of the majority, uniting themselves in what they term a "third party" (*tiers-parti*), offered an amendment to the address in which they timidly and modestly claimed more liberties for France. Ministerial responsibility, the presence of the ministers in the House, the repeal of the law which has placed the press under the absolute control of the Government, the obligation of the Government to choose the mayors in every township from among the elected municipal counsellors—such was the programme of the third party. Their amendment was strongly opposed by the Minister of State, M. Rouher, who plays in our political system the part of *ministre-orateur*. He has no portfolio, but is the mouthpiece of all the other ministers and of the Emperor. Notwithstanding his rhetorical efforts, the amendment was supported by sixty-five votes, the largest opposition vote on record since the foundation of the Empire, representing, as it did, the fourth of the whole House, which is only composed of two hundred and forty members. Among the members who voted with the majority was a certain M. de Bussierre, deputy of Strasburg. M. de Bussierre's course was, it seems, not approved in Alsatia. The discontent was all the more justified as at the last elections M. de Bussierre, during his canvass, had promised to give his support to all liberal measures and ideas in the House of Representatives. He received so many reproachful letters that he sent his resignation to Count Walewski, and now he offers himself for re-election to the electors of the district of Strasburg. He has found a formidable opponent in the person of M. Laboulaye, whose name is familiar to every American. The very choice of M. Laboulaye as the liberal candidate is very significant. M. Laboulaye is not bound to Alsatia by any tie; he was not born there, and owns no property in this province. I doubt if for years he has been in Strasburg. The liberal electors of that town choose him because he represents now liberalism in its purest form, abstractedly of any dynastic or party spirit. M. Laboulaye does not belong to what the Government calls the *anciens partis;* he has never mixed actively with politics and never held office under any government. His position in France can only be compared to the position which John Stuart Mill occupied in England before he became a member for Westminster. He is a scholar and a philosopher rather than a statesman. But, under the present circumstances in France, liberals do not enter Parliament with the hope of being entrusted with office and responsibility. They have no other ambition than to protest against despotism, to claim just liberties, and to make solemn appeals to the heart and to the conscience of the nation. M. Laboulaye is admirably fitted for this mission; his liberalism is most enlightened and pure; he cannot be accused of being a revolutionist, a partizan. By his books and his public lectures he has already exercised a most beneficent influence over the new generation in France. Let us hope that in Parliament his influence may soon be extended to the whole nation.

It is no exaggeration to say that the eyes of France are all turned now on Strasburg: the electoral duel, which will take place in a few days, between MM. de Bussierre and Laboulaye, will be watched with the keenest interest. We see on one side a wealthy man, respectable in his private life and much liked for his personal qualities, but subservient to the Empire and supported by all the influence of a powerful administration, by all the officials, by all the enginery of centralization; on the other side a stranger to the country, without any influence but that of his name, his reputation, and his public virtue. I do not venture to predict which side will be victorious; but I feel quite sure that nobody in America who knows what support M. Laboulaye has given to the good cause during the American war will be indifferent to the result of this election.

I was not much mistaken when I chose as the title of some articles on the state of Europe, some time ago, these words: "The Unsettled State of Europe." Political affairs look more ominous than ever, and we are fast approaching a crisis. Rumors of war are rife. Austria and Prussia are both making preparations for a struggle. Why the two great powers of Germany should threaten each other, I am at a loss to understand. A war between them would be a stupendous folly; but that is, perhaps, the reason why it will take place. As nobody has ever gone to the bottom of Hegelian philosophy, nobody suspects to what limits can be carried the absurdity of German rulers and diplomats. Where now is concealed the phantom of German unity? It was shown for a moment to the German nation at the beginning of the war with Denmark; but it soon disappeared, and we only see hovering in the German sky the black eagle of Prussia and the double-eagle of Austria; the minor sovereigns feel themselves between the hammer and the anvil; they answer evasively to the notes in which they are asked which side they would take in case of a war. Fancy the distress of the young Bavarian sovereign, disturbed by such unpleasant questions in his enjoyment of Wagner's and Schumann's music, the trouble of mind of the King of Saxony, and of the King of Würtemberg—not to mention the many smaller stars which would vanish so soon in the night of a German war. Italy, meanwhile, is arming also; she will attack Austria on the Mincio if Prussia attacks her in Germany. And what says the Emperor of the French to all this? He rubs his moustache and is waiting for what diplomatic jargon calls "eventualities." The Danubian Principalities are left without a sovereign, since Couza, the unhappy imitator of our Cæsar, has been quietly dismissed. "O imitatores, servum pecus!" Russia is advancing an army towards the Danube, and the *Gazette* of Moscow, the organ of the old Muscovite (that is, National) party, writes threatening articles in which the occidental powers are given to understand that since emancipation has made Russia the country of sixty millions of freemen, she will no longer submit to the humiliating conditions of the treaty of Paris, and is going to resume in the affairs of Europe the position which is due to her. So matters everywhere have a very alarming look. The dogs of war are not yet loosed; but they seem to be getting impatient and restless. May America at least give to those who love peace and liberty a more consoling spectacle! May the spirit of faction subside, and the whole country, forgetting the past, or at least only remembering of it what is most noble and cheering, enter the path of moral and material progress. I would not tell my American friends, "Rest and be thankful," because rest is not the lot of human existence. I would say, "Watch and be thankful." I see no differences now in the United States which cannot be settled without violence, no wounds which cannot heal, no dangers which cannot be averted with firmness, prudence, and magnanimity.

A. L.

ENGLAND.

LONDON, April 7, 1866.

I AM afraid you will get tired of the very name of reform in my letters. Yet at this moment an English correspondent cannot well write about anything else. It is not that people are particularly excited about the matter, but that reform, like a carriage at the door of a theatre, "stops the way." Till we get rid of it, we cannot talk or write of any other political topic. Will the bill pass, or will it not? is a subject the "pros and cons" concerning which I have heard discussed till I am sick of the question. The general voice of "society" is certainly against the passage of the bill; and, as a matter of calculation, I believe the verdict is correct. Somehow or other the agitation in favor of reform appears to me not to have been a success-

There have been public meetings at Rochdale, Bradford, and all the chief manufacturing centres, which, so the reports inform us, were very crowded and very enthusiastic; but in the country at large there has been hardly any response to the demand for an expression of public opinion. There is nothing, for instance, like the popular agitation which was beginning to spring up throughout England on the subject of Jamaica just before the Government resolved to appoint a commission of enquiry. Mr. Gladstone's tone, both at Liverpool and at Manchester, was hardly that of a man fighting a winning cause, and Mr. Bright as usual damaged a good case by uncalled-for exaggeration. He stigmatized the coalition between the moderate Whigs and the Tories as a "dirty conspiracy." Now I utterly disagree with the Liberals, of the class represented by the *Spectator* newspaper, who are haunted by the bugbear of seeing "intelligence swamped by numbers;" but it is absurd to surmise that they are not honest in their opposition to the bill. In order to uphold what they believe to be right, they have broken with their party—in the case of members of Parliament jeoparded their seats—and injured their political prospects because they dread the notion of seeing political power entrusted to the working classes. I think they are wrong, but to stigmatize such men as "dirty conspirators" is a mere piece of oratorical clap-trap. The Liberal press represents fairly enough the feeling of the country, but while the *Daily News*, the *Daily Telegraph*, and the *Star* are strongly in favor of the bill, the *Times*, the *Morning Post*, and the *Pall Mall Gazette* are dead against it. However, next Thursday the bill comes on for the second reading, and before I write next we shall know more about its chances. At present the Government counts on a majority of twenty to thirty; but then no calculation can take account of absentees.

On Easter Monday we had the annual review of the volunteers at Brighton, the Prince of Wales being present himself on the occasion. Everything, I believe, went off as usual; but by this time our "civic defenders" have become a bore, and we hear very little of the great volunteer movement. I have always regarded this movement, which was called into being some five or six years ago, at the time of one of our periodical panics about a French invasion, as an essentially short-lived one. I believe it did good to the credit of England abroad, as showing with what rapidity we could raise a volunteer army in case there was any threat of invasion—though this fact could hardly have needed proving to any one at all acquainted with England; but I utterly disbelieve in the volunteer system becoming a normal institution of the country. The novelty of the thing is dying out, and the sort of romance which attended its first beginning is dying out also. Men are growing ashamed of walking about the streets in uniform and playing at soldiering. So, gradually, the movement is passing away, and will pass out of existence altogether in the course of a year or so, supposing no fresh apprehension of danger to take hold of the public mind. The only part of the movement that will live is the practice of rifle-shooting. The taste for practising with rifles is one very consonant to ordinary Englishmen's feelings, and I have no doubt we shall have in consequence a large body of good rifle-shooters amongst the civilian population. But to own a rifle and spend sufficient time on shooting to become a good marksman implies a liberal allowance of money and leisure, and the nucleus left of the volunteer army will consist practically of men of birth and fortune. The movement, in fact, has never been a popular one, in the true sense of the word popular. The cost of being a volunteer was, at the lowest calculation, twenty pounds a year, and therefore it is needless to say that the number of volunteers who really belonged to the working class was extremely small. The bulk of the privates consisted of the small farmers, clerks, and tradesmen. Oddly enough, I attribute a good deal of what is called here the "conservative reaction" to volunteering. The country squires and noblemen took very kindly to the movement, and gave not only their money but their time to its promotion. The consequence has been that the landed gentry have got an influence over the lower and middle class which they never possessed before. On the whole, this influence is beneficial; it tends, as far as it goes, to break down those class barriers that are the curse of English life; but, on the other hand, while it has increased the sympathies between clerks and yeomen and the squirearchy, it has somewhat diminished the sympathy between the former class and that of the workingmen. The volunteers, who represent the bulk of the borough constituencies under the existing franchise, have learned to represent the prejudices of the class from which their superior officers are drawn. Brown and Jones and Robinson, who have shot with a marquis and been drilled by a member of an old country family, are far less democratic in their prejudices than when they had never donned a uniform or heard the word of command.

On Tuesday last I was present at the funeral of the ex-Queen of the French. If you care about the details of the ceremony, the number of mourning coaches, and the list of the mourners, you will find them given at length in our daily newspapers. Your French correspondent will doubtless give you the French aspect of the ceremonial. From an English point of view there were one or two features about the occasion worthy of note. Our royal family was most fully represented in the person of the Duke of Cambridge, the Prince of Wales, and a special aide-de-camp of the Queen; but of the English aristocracy there was, oddly enough, not a member of any importance present at the funeral, with the doubtful exception of Lord Clanricarde. If the gathering at the funeral was intended as a demonstration of respect to the deceased lady, it was a very remarkable one. Viewed as a political demonstration in favor of the House of Orleans, it had no significance whatever. Louis Philippe was never personally popular in England, and the whole policy of the monarchy of July in reference to the Syrian business, to the Spanish marriages, and to the Tahiti affair was singularly offensive to English national feeling. On the other hand, Napoleon III. has studied English feelings carefully, and has outlived, in this country at any rate, the animosities which were occasioned by the manner of his assumption of power. He is now more or less of a popular hero with us; and, with the exception of a few staunch old Tories, Englishmen are ready enough to accept his dynasty as an accomplished fact. I do not say for one moment that this English good-will makes his throne any the more secure, or that the fact of our being disposed to believe in the permanence of his dynasty is any strong reason for believing his son is likely to succeed him. There is not a nation in the world where popular instincts with regard to the feelings or conduct of other nations are more fallible than our own. The only reason I allude to the public good-will towards the Empire, which is the fashion of the day, is to guard you from thinking that the crowds who assembled on Tuesday to see a whole bevy of princes had any abstract preference for Orleanism over Imperialism. The Prince of Wales (according to a French phrase, for which I know of no exact English equivalent) "affiche's" the most pronounced Tory sentiments, talks of the Tories as "we," and is said to entertain a very unfriendly feeling towards the Emperor as the representative of democracy and universal suffrage. For some time past Napoleon III. has expressed a wish that the Prince and Princess should visit him in Paris; but hitherto the wish has not been fulfilled, owing to the reluctance of the Prince to be a guest of a Napoleon. It is the tradition of the House of Hanover that the heir-apparent should always entertain opposite politics to those of the reigning sovereign; and therefore as the Queen has always inclined to the Whigs, it is natural the Prince should ally himself with the Tories. Possibly his presence at the funeral might be regarded as a sort of protest against the Empire; but even this I doubt personally.

PARIS GOSSIP.

PARIS, March 30, 1866.

THIS week we have had a strange mixture of religion and revelry—*stabat maters, misereres*, and the sermons of Father Felix in our churches, and balls, concerts, and routs in the *salons* of our *beau monde*. Nor has the voice of scandal been silent, for many rumors have gone the round of our clubs and cafés of dishonorable tricks at the gaming-table, romantic adventures and hostile meetings, all associated with well-known names, which prudence, however, forbids my mentioning here.

You will have seen from the papers that our Imperial Opera is no longer to be attached to the civil list. It is to become a public speculation, and it is generally believed that the present director, M. Perrin, will be at the head of this enterprise. Richard Wagner was admitted to the Conservatoire last Sunday, and for the first time the march in the "Tannhäuser" was executed by the orchestra and choruses of the *Société des Concerts*. The march was *encored*, although it was the last piece on the programme. The Abbé Liszt was present, and at his side sat a rich and beautiful American lady, who seemed to share the abbé's delight in listening to the execution of the great German maestro's work. M. Semet has now in rehearsal at the Opera Comique an operetta called "La petite Fadette," the libretto of which is taken from Madame George Sand's novel of that name. The same maestro is also engaged upon an opera in three acts, to be entitled "Punchinella." M. Semet is the author of the music of "Gil Blas," "Des Nuits d'Espagne," and several other popular works. Verdi is now at his villa Santa Agata, near Basseto, writing a new opera to be called "Don Carlos"—the words from Schiller's play of that name. This opera is to be brought out in Paris.

Writing of music, I hear that Sweden is going to send us another nightingale, even more marvellous in vocal powers than Jenny Lind. The name of this marvellous warbler is Marie Taskatt. If we may believe the Stockholm newspapers, this lady's voice surpasses everything that has been heard since the time of Malibran. I suppose you have heard that Jenny Lind is

to sing at Cannes in Easter week. This will be the first time that the French will have heard this famous lady in their own country.

Prince Napoleon left Paris on Wednesday evening for Toulon, where he will embark in his yacht, the *Prince Jérome*, for Naples. The prince is accompanied by some celebrated connoisseurs in painting, and intends ransacking the old *châteaux* and country villas, where he has been told some excellent copies of the old masters are to be found.

Prince Lucien Bonaparte, the distinguished philologist, has returned from Spain and brought with him a cabinet of curiosities, which he intends to open to the public.

The French Imperial Academy intends next year to celebrate its 200th anniversary. Upon that occasion two *fauteuils* are to be given *in partibus* to two ladies—Madame Dudevant, better known as George Sand, and Rosa Bonheur, the eminent cattle painter.

Notwithstanding the exhibition of 1867, our annual *salon* is this year well supplied by our principal artists. Already 5,000 first-rate pictures have been received. The two which seem to attract greatest attention are a landscape called "La Remise de Chevreuils" and "La Femme au Perroquet," both by Courbet. The latter picture represents a woman in a state of nudity playing with a parrot, and has already been purchased for a large sum by M. Nieuwerkerke, director of the *Beaux Arts*. There is also another picture, a portrait of a lady, and entitled "La Veuve." The lady is dressed in deep mourning and has in her hands a bouquet of violets. Now, although the catalogue contains only the two words, *a widow*, opposite the number of the portrait, there is a story connected with it full of poetic terror. The lady is the Countess O——, who, although now only twenty-four years of age, has been twice widowed. She is said to be of humble birth, but when only sixteen years old her great beauty attracted the attention of the Marquis de D——, who married her. On leaving the church, however, the marquis was assassinated by some obscure rival, and the lady was left a widow with an immense fortune. The *marquise* retired to a convent, where she remained till her twentieth year. She then made a journey to various parts of Europe, and visited, among other places, St. Petersburg, where one of the most wealthy *boyards* of Russia placed at her feet his heart, his diamonds, and his millions. The marriage was celebrated in the house of the bridegroom's mother, in a remote part of Russia, some distance from his own estate. The newly married couple left for their new home in a magnificent sleigh. On the way they were attacked by wolves, and the count, in trying to defend his bride, made a false step, fell out of the sleigh into the snow, and was immediately devoured by the wolves. The horses, mad with terror, dashed off with immense speed and did not stop till they arrived at the count's château, which was brilliantly illuminated for the reception of the newly married couple. This story, I am assured on good authority, is perfectly authentic.

The inhabitants of Marseilles, who have long been mourning over their lost quarantine laws and their much cherished Lazaretto, are determined to make an effort to get them back again. A deputation from that city is expected to reach Paris to-morrow in order to present to the Emperor a petition for the re-establishment of a new Lazaretto at Frioul, an island near the mouth of the river, and that a quarantine of fourteen days shall be imposed upon all vessels coming from a suspected port.

There has been great irregularity of late in the transmission of telegrams between France and England and France and Prussia, owing to the breaking of several of the telegraphic wires.

There has of late been considerable outcry in France against the system of burying people immediately after death, and the opinion of those who are opposed to this system, which prevails here, is that many people are buried whilst only in a state of trance. M. Lalu, curé of Gizay, has just written a letter in one of our provincial journals in which he says: "Having been summoned to assist my brother curé of Nieuil, I have just witnessed a fact which has greatly excited the people of the neighborhood. A woman named Redegonde Deguesseau, who was supposed to be dead, was to have been interred in the morning and the relations were all in attendance, when the person who had laid out the corpse, as she was completing her work, fancied she discovered a slight movement in the right arm. Upon examination the woman was found to be still alive! I immediately went to see her and found no pulse, no movement. But on close examination I fancied I saw a swelling of one of the arteries of the neck. I let a few drops of brandy fall upon her teeth, which were clenched in such a manner that it was impossible to separate them. And shortly after a slight hissing noise was heard. The woman continues still alive (twenty-four hours after) in the same comatose state."

It appears that the Commissioners for the Exhibition of 1867 have by some means or other given offence to the Emperor of the Celestial Empire. His Celestial Majesty has turned quite sulky, and refuses to allow any of the products of his realm to be sent to the World's Fair.

A curious kind of industry has sprung up of late in France. Two-sous pieces, struck in 1852, are now being eagerly bought up, principally by silversmiths, for five sous each. It appears that in 1852 one of the employees at the mint accidentally let fall into the cauldron filled with copper an ingot of gold. Fearing that he would be discharged if the accident became known, he concealed it, and the coins were struck off. It was not till the ingot was missed that the workman mentioned the circumstance. The matter was kept in secresy for some time, but it is now pretty generally known, and everybody is on the look-out for the two-sous pieces of 1852.

Our prefect of police is now very seriously occupied with the question of clubs. Owing to the enormous sums that have recently been lost by the sons of some of our best families, great complaints have been made against the sanctioning of gambling at these establishments. M. Pietri is now determined to enquire into the matter, and to take such measures as may satisfy the just demands of those who are deeply interested in the matter. Another cause for this enquiry is the recent discovery of numerous dishonorable tricks at the gaming table.

Paragraphs are continually finding their way into our daily papers reporting the intention of M. Guizot to quit the Protestant religion and become a Catholic. I can assure you that these rumors are entirely false. M. Guizot is one of the staunchest supporters of the Evangelical Church in Paris. Madame de Meulan, the late wife of this celebrated statesman and historian, was born a Catholic, and only embraced the Protestant faith on her death-bed. At that solemn moment M. Guizot read to her one of Bossuet's sermons on the immortality of the soul.

A very singular bank, called the Bank of Intellectual Credit, is about to be established at Lyons. The idea of this bank was first suggested by Father Enfantin, who, a few days ago, invited to a banquet, at the Grand Hôtel, about twenty persons for the purpose of discussing the question. What the object of the bank is to be I cannot quite understand, but, as a committee has already been appointed to draw up a plan of operation, we shall doubtless soon be enlightened.

A friend of mine, who arrived here from Marseilles the other day, informs me that an English colony is about to be founded in that city, for the purpose of placing England in direct communication with India. Two thousand houses are to be built by the English Crédit Mobilier on land which this company has bought of the Crédit Mobilier of France. The architects were to reach Marseilles on the 7th. These houses, it is said, will be completed in the course of about eight months.

You have doubtless heard of the chiffonniers, or rag-pickers, of Paris, a class of men almost peculiar to this city. Some curious details respecting the industry of this interesting body of men have lately come under my notice. They perambulate the streets of Paris, principally during the night, with baskets on their shoulders, a lantern in their right hand and a long hook in the left, picking up everything convertible into money that may fall in their way—rags, old iron, pieces of paper, etc., etc. Their principal gain, however, is derived from rags, which they sell to marine-store keepers. The number of these traders exclusively occupied with the produce of the chiffonnier is 110, who employ 350 workmen for the purpose of cleaning and sorting the rags. The amount of business done by them is about six millions of francs a year. The number of chiffonniers now in Paris amounts to between 3,000 and 4,000, each of whom is obliged to wear a medal given him by the prefect of police. I may say more upon this question of rags on some future occasion, for it is one particularly interesting to a country largely employed in the manufacture of paper.

RELIGIOUS INTOLERANCE IN ITALY.

FLORENCE, March 29, 1866.

OUR second spring has come just in time for the Easter holidays; senators, deputies, and "own correspondents" have gone home with school-boy glee to enjoy them; foreigners have migrated to Rome for the holy week—"*Pasqua con Dio, Natale co 'tuoi, carnevale con chi puoi,*" says the Tuscan proverb, and the Florentines are by no means pleased that their guests prefer spending Easter as well as Christmas "among their own people" to remaining in the hotels and boarding-houses of the new capital. Their absence is strikingly perceptible in the streets, the cafés, and restaurants, where the *si* reigns once more predominant over the barbarous consonants of the north. At the present moment the seven churches are thronged with peasants from the suburbs and not a few citizens, who take the opportunity of the half holiday to "report themselves to their confessors." The priests have been very busy this year in distributing the Easter summonses, espe

cially the Government servants; by the returns they will be able to calculate who are for and who against them. The radical papers have raised an outcry against the Ministers of Public Worship and of War for allowing their civil servants and soldiers to be "thus tampered with;" but as the priests can only exhort them to confession, and no punishment now awaits the neglect thereof, it would be absurd to use prohibitory measures. In the good old days of despotism, the distribution of the Easter tickets was one of the most powerful weapons of police *espionage*. Tickets were distributed to every member of every household, and a register kept by the parish priest. At the moment that each penitent entered the confessional, he or she returned the ticket to an assistant priest, who checked off the name on the register, placing a cross against the absentees. A copy of the register was sent to the police, and names with crosses against them were synonyms for suspected persons. Not only were they refused passports or sure to be the first arrested in case of an *émeute*, but it was very difficult for them to obtain marriage or even shooting licenses. Even now, when the sacristy and police bureau are at enmity, the country people attach a superstitious importance to "returning their tickets." This morning when my servant went to our butcher for meat, he told her that three hundred and sixty-four days in the year he served us willingly, but that this one day he wanted for himself and men to report themselves at the parish church; that, in short, his shop was empty, but that the Easter Sunday lamb would be first-rate. Telling this story just now to a liberal Florentine Catholic, I asked him whether my butcher was an exception to the rule. By no means, he said; we get our share of calumny, but the epithet of Paolotti (the new name assumed by the old Jesuits) is only too justly applied. I send my children to the "Padri di famiglie," a large school frequented by more than a hundred boys and as many girls. We never fast, but the children refuse to take meat to school either Fridays or Saturdays, because, though none of the masters interfere, *all* the other children plague or avoid them, or throw their meat out of window! It is exceedingly difficult, even after a long residence exclusively among natives, to ascertain how far the conviction that is daily taking deeper root of the incompatibility of the temporal sovereignty of the Pope with social and political progress and liberty, conduces to free the masses from their spiritual subserviency to the head of the church.

The total failure of the reactionary party to fill the benches of the *Sala dei du gento* with their partizans (three only, Cantù, Doudes Reggio, and Martini finding place there); the eagerness with which the report of the commission charged with the examination of the bill for the abolition of the ecclesiastical corporations is looked for; the general approbation accorded to Signor Natoli, late minister of public instruction, for his proposition to take the education of Italian youth entirely out of the hands of the clergy, seem signs of an increasing desire for freedom from moral and religious thraldom; but we must bear in mind that the seventeen millions of illiterate Italians of the literally *inalfabeti*—men and women who do not know their letters—have little or nothing to do either with electing members of Parliament or agitating for abolition or for secular education. On the contrary, if we could only give credence to the number of crosses made by these *inalfabeti* and witnessed by the priests, goodly rolls of petitions against these sacrilegious projects exist and are daily increasing in bulk. The new "challenge of Barletta" from Catholics to Protestants does not bear witness to diminished zeal on the part of the former. In that same town, the scene of the famous challenge and subsequent duel between French and Italians so graphically narrated by the late Massimo d'Azeglio in the book that contributed not a little to arouse Italians to a sense of their degradation, and a desire to emulate the deeds of their forefathers—in that same town a certain Protestant minister, Gaetano Giannini by name, took up his abode, and gathered round himself a gradually increasing flock. The curate of Barletta finding his personal influence insufficient to stem the tide of proselytism, availed himself of a religious festival held in the parish church to arouse the ire of his parishioners. He succeeded only too well. On leaving the church, "armed with instruments found within the sacred precincts" (I quote the ministerial report), the excited multitude rushed to the house of the Protestant pastor and, not finding him, murdered in cold blood three of the inmates, mutilating the corpses in the most fiendish manner. Not satisfied with this, they entered every house suspected of harboring heretics, and, finding no human victims, ransacked and destroyed the furniture and smashed the windows. Nor is this intolerance confined to the ignorant populations of the *Puglie*. The other day, in Milan, a young bride was pelted with rotten eggs and otherwise molested on her way to the Protestant church with her heretic bridegroom; and here in Florence the priests constantly refuse to bury wanderers from the fold. At Cattagirone, in the province of Catania (Sicily), tumults similar to that of Barletta were only prevented by energetic precautions on the part of the local authorities. The *Gazzetta di Romagna* affirms that the clerical agents constantly excite the peasants against all suspected of heresy. The *Corriere Italiano* quotes secret instructions from Rome to the Easter preachers in the Tuscan, southern, and ex-papal provinces to incite the masses to protests in favor of the temporal power of the Pope. As to the Barletta atrocities, the clerical organs make light of them.

"Ministers of Italy," exclaims the *Armonia*, "you are instruments in the hands of the revolution. You assist in the demolition of the religion of the state. The populations abhor heresy and apostacy; these you protect. They expel the Protestant emissaries; you shelter them. You and your party desire the corruption of the people and the ruin of religion; but the people cry Viva God! Viva the religion of Christ! and this will triumph."

The *Unita Cattolica* understands why Catholic missionaries should go and convert "Pagan England," because Catholics believe in no salvation outside the pale of the Roman Church; but cannot see why Protestants, who admit that all believers in God of whatever creed (*sic*) may be saved, should try and foist on Catholics their own special doctrines.

At the last sitting previous to the Easter recess, Deputy Corte presented a motion for the abolition of the first article of the statute which "proclaims the Catholic religion the only religion of the State." He did but express the desire of a large portion of intelligent Italians, who maintain that only when all religious creeds are equally protected by the law can Cavour's formula of a free church in a free state be realized.

After the Easter recess it is hoped that the commissions will be ready to report on Signor Scialoja's financial bills and on the "administration of ecclesiastical property bill." To the passage of the latter many look as the only chance of supplying the deficit, which, if we take a medium figure between the statement of the Government and that of its enemies, stands at 300 millions. The railroads are ceded, the crown lands sold, the very sands on the sea-shore let to contractors; no wonder, therefore, that the eyes of weary tax-payers are fixed on the immense church property as on an anchor of salvation.

The enthusiasm about the *Consorzio Nazionale* (or public subscription for extinguishing the national debt) seems subsiding. As yet the *Gazzetta del Popolo*, the Torinese paper which first started the idea, gives a list of seven millions: King and royal family, 1,225,000f.; Bank of Naples, 1,000,000f.; municipal corporations, 2,100,000f.; private subscriptions, 2,000,000f.; and a Venetian 500,000f. If the payment of all the subscriptions rests on the same chances as the Venetian's, the prospect is not brilliant. At first the anonymous donor was said to be Count Pappadopoli, of Venice, and his family suffered no small molestations in consequence, but the rumor I am assured by members of that family had no foundation whatsoever. The subscriber is a certain Sig. Merrighi, who affirms that 500,000 francs are owing to him by the King for attempts made and expenses incurred, with the written sanction of both his Majesty and Count Cavour, for the recovery of the "Iron Crown" carried off from Monza by the Austrians in their retreat from Lombardy. This credit Signor Merrighi transfers to the *Consorzio Nazionale*.

LITERARY NOTES.

Messrs. Bangs, Merwin & Co. will sell, at their auction rooms, on the evenings of May 2d and 3d, a collection of autographs amounting to between five and six hundred lots, and embracing a greater range, as regards the personages represented therein, than any collection of similar size sold in this city for years. It will not compare, of course, with the great English collections which sometimes fall under the hammer—as that of Dawson Turner, for instance, the catalogue of which makes a volume of some two hundred pages—but it contains a number of specimens which most collectors would consider desirable. The catalogue opens with fifty odd lots of old American autographs, mostly those of colonial governors and proprietors, members of the Congress of 1765, statesmen, etc., before the Revolution, presidents and members of the Continental Congresses, and generals and officers of the Revolution. Of the value and rarity of most of these autographs we are no judge, but we believe they usually command high prices for the purposes of historical illustration, which, just now, is the rage among American book-fanciers. Lot 46 we may note in passing—a letter from John Evans, member of Congress from Delaware—since it refreshes our memories with the fact that lotteries were not always regarded in the disreputable light that they are now. "We have been unfortunate in the second draft," writes Evans to Cesar Rodney, "the Presbyterians having set

up a lottery for Newcastle and Christeen meeting-houses, which has retarded the sale of our tickets." This was in 1778. On the 25th of July of the preceding year, we find General Schuyler writing to Gouverneur Morris in defence of his reputation; and the next day Washington is writing, from "eight miles east of Morristown," to Daniel Morgan, whom he orders "to halt at Trenton, and remain there till further orders, unless you should receive authentic information of the arrival of the enemy's fleet within the Capes of Delaware." Fifteen years later,

> "When wild war's deadly blast was blawn,
> And gentle peace returning"

had made the struggling colonies triumphant States, we have General Wilkinson laying down the law in regard to deserters. "If a deserter is discovered," he writes, "making for the enemy, it will be well for the scout to shoot him and bring his Head to you, for which allow forty dollars. One Head lopped off in this way and set upon a Pole on the Parade might be the means of saving many lives, for it would certainly cut up the defection of the troops, root and branch." Certainly, general; or, if it would not do this, it would do the next best thing—cut up the deserters! From the heroes of our Revolution, and later, we pass to sundry royal and noble personages of Europe, beginning with the dukes of Brunswick and kings of Denmark, after which come the kings of Sweden and emperors of Germany. Among the former are specimens of Gustavus Adolphus and his daughter Christina, Charles the Twelfth, and Gustavus the Third, he whom Ankerstrom assassinated at a masked ball; and among the latter, Charles the Fifth, of whose famous "Cloister Life" Stirling has written so intelligently. There are nine specimens of the great men of the Thirty Years' War, as, Frederick the Fifth, Elector Palatine and King of Bohemia, the unfortunate husband of Wotton's beloved and royal mistress, the erewhile Princess Elizabeth; Ottavio Piccolomini, whom Schiller's and Coleridge's readers well remember; and the great Wallenstein, Duke of Friedlandt. Other German notabilities are Don Juan of Austria; Alexander Farnese, Prince of Parma; Prince Eugene of Savoy; Frederick the Great; Blücher; and the mysterious Casper Hauser, one of whose school exercises has somehow been preserved. The list of English state celebrities is not large, the best specimens therein being those of William of Orange; Henry St. John, Lord Bolingbroke; George, Lord Lyttleton, by courtesy ranked among the English poets; and Lord Nelson. Nor is the list of English writers of much consequence, the best names being those of Sir Joseph Banks, David Hume, Crabbe the poet, Bishop Hurd, Samuel Richardson, John Horne Tooke, and Moore, Proctor, and Wordsworth. There are some three or four good specimens of modern Italian writers and about the same number of composers and singers. Skipping some four or five pages of American autographs, mostly of public characters, we reach a cluster of celebrated names, as, Melancthon, Peter Du Moulin, Swedenborg, Count Zinzendorff, Salmasius, Leibnitz, Puffendorf, Linnæus, Barhaave, Haller, Zimmermann, Fichte, Hahnemann, C. G. Heyne, Humboldt, Neander, and the great philologist, Wolf. The poets and novelists of Germany are not largely represented, the most noted in the catalogue being Richter, Wieland, Zschokke, La Motte Fouqué, Kotzebue, Jacobi, and Count Stolberg. Eight pages are set apart to French autographs, the list of which is only tolerable as regards noted persons of the *ancien régime* and the Revolution, but excellent as regards the Napoleon family and the marshals of the First Empire, lacking only three specimens of the last, viz., Duroc, Lannes, and Poniatowski. Of the autographs of French authors there are specimens of D'Alembert, Boileau, Buffon, Bernardin de St. Pierre, Chateaubriand, Grimm, Rousseau, Voltaire, and La Place. The only thing worthy of note in the small collection of theatrical curiosities is a Bible which formerly belonged to Mrs. Siddons, whose autograph it bears upon the title-page. It passed, at her death, we are told, into the hands of her sister, Mrs. Whitlock, and from her to their nephew, Horace Twiss, at the sale of whose library it was purchased, it is to be presumed, by the owner of the present collection. What prices the autographs we have mentioned, and others of a similar nature, are likely to fetch, cannot be foreseen, the market value of this sort of literature depending so much on the whims of the buyers, but, judging from recent sales, we think the early American portion of them will realize the most.

—Mr. G. W. Carleton will shortly publish "Recommended to Mercy," an English novel of a rather peculiar character, which attracted considerable attention when it originally appeared; "Josh Billings—His Book," another collection of American humor, so absurdly in vogue just at present, and, in our way of thinking, the poorest of all; and "Adrift in Dixie," a volume of Southern travel by Edmund Kirke. It is doubtful, however, whether the last work will be published as announced; for at the latest accounts the edition which was manufactured in Boston was destroyed by the burning of the Norwich steamer in the Sound. Mr. Carleton has also in preparation a memoir of Junius Brutus Booth, the elder, written by his daughter, Asia, the wife of Mr. J. S. Clarke, the comedian. It will not be published for some months yet, though we believe it is nearly stereotyped.

—The late John Thomas Hope made a catalogue of a collection of early newspapers and essayists, which has just been published at Oxford by the Clarendon Press, and which contains several amusing mistakes. "The Idle Man," for instance, Mr. Hope's copy of which seems to have formerly belonged to Sir Francis Freeling, the well-known collector, is attributed to a Mr. William A. Colman, from whom Sir Francis received it as a present, Mr. Hope never having heard, apparently, of our veteran poet, Dana, by whom it was written some forty odd years ago. He blunders likewise concerning the old American magazine, "The Portfolio," which was edited by Dennie, who merely figures in the catalogue as "Oliver Oldschool." But Mr. Hope's worst blunder, all things considered, is his ascribing "Salmagundi" to its supposititious editor, "Launcelot Wagstaff," in utter ignorance of its real ones, Paulding and Irving, with the last of whom, and what he wrote, he ought to have been acquainted. Altogether, this catalogue of early newspapers and essayists is a needless production.

—What has been done for a number of years past towards the illustration of English history by the publication of its state papers, under the direction of the Master of the Rolls, is now being done for Scottish history, Sir Wilson Gibson-Craig, the new Lord Clerk-Register of Scotland, having the sanction of Parliament for the publication of a similar series of documents from the papers under his charge. He has secured the services of a number of Scottish scholars and writers, among whom may be mentioned the Duke of Argyll, Lord Lyndsay, Prof. James Simpson, Prof. Cosmo Innes, David Laing, Mr. William Forbes Skene, Mr. Joseph Robertson, and Mr. John Hill Burton (the latter known in this country by his pleasant, gossippy volume, "The Book Hunter"), each of whom has agreed to edit an important historical work for the series, the first issues of which are now passing through the press.

—William Jerdan, the editor of the old "Literary Gazette," the forerunner, in a mild way, of the English literary weeklies of the present day, is about to add to his writings, which of late years have been mostly devoted to himself and his doings, by the publication of a volume of reminiscences entitled "Men I Have Known." It is promised to contain much pleasant gossip about the principal literary, political, and legal celebrities of the present century—a statement which does not particularly impress us, since the promise in question only mentions three names, and those not among great English writers, viz., Campbell, Moore, and Barham. Jerdan certainly came in contact with a good many men in the course of his long life (he is now eighty-five years old), but it may be doubted whether he ever really knew any first-class authors, since his journal was scarcely of sufficient weight to patronize them or to be patronized by them in turn. Its mission was rather the bringing forward of young writers than the conferring of celebrity on old ones. Among the former whom Jerdan discovered, so to say, was poor Miss Landon, whose mysterious initials commanded as much attention forty years ago as the names of Mrs. Browning and Jean Ingelow now. "L. E. L.," however, was Jerdan's great "take;" for the rest that came to his net, and who should have been fish, to make the proverb true, they were such small fry that few save Jerdan himself can remember their names.

—The number of scientific journals published in England and on the Continent, joined to the difficulty, not to say impossibility, of a reader's making himself familiar with all of them, even in one department which may be his specialty, has just resulted in a new journal, which is to be published once a week in London, under the name of *Scientific Opinion*. The ground which it proposes to occupy is a large one—much too large, we fear, to have any but the scantiest justice done it. Devoted to no special walk of science, it aims to include all, even the most widely separated, as agriculture, archæology, astronomy, botany, chemistry, ethnology, geography, geology, palæontology, medicine, mechanics, meteorology, mining and mineralogy, microscopy, photography, physics, zoölogy, and comparative anatomy. Nothing exhaustive can, of course, be presented on all these subjects, but merely a *résumé* of what is written and said about them; for, in addition to extracts from important articles in the scientific periodicals of England, the Continent, and America, the new journal will contain reports of the proceedings of the various English scientific societies, and abstracts of the transactions of the royal academies of Paris, Brussels, Berlin, and Vienna. The first number of the *Scientific Opinion* was to have been, and probably was, published on the 4th of the present month, at the rate of fourpence a week.

—The republication by Bohn of a portion of "Seymour's Sketches," mentioned by us a few weeks since, has occasioned some bad blood, first, on the part of Seymour's son, who denounced Mr. Bohn for obtaining information of him for a pretended series of "Lives of British Artists," when he only wanted it to accompany a mutilated edition of his father's drawings; and second, on the part of Charles Dickens, who took umbrage at young Seymour's letter, which unduly magnified his father's share in the success of the "Pickwick Papers." Dickens's missive is not in the best taste, bearing hard, as it does, on the Seymours, father and son. Of the former he says that he "never originated, suggested, or in any way had to do with, save as illustrator of what I devised, an incident, a character (except the sporting tastes of Mr. Winkle), a name, a phrase, or a word, to be found in the 'Pickwick Papers.' I never saw Mr. Seymour's handwriting, I believe, in my life. I never even saw Mr. Seymour but once in my life, and that was within eight-and-forty hours of his untimely death." He then proceeds to give an account of the origin of the "Pickwick Papers," copying for that purpose a portion of his preface to the late English editions of that work, with which our readers may be supposed to be familiar, and concludes as follows: "In July, 1849, some incoherent assertions made by the widow of Mr. Seymour, in the course of certain endeavors of hers to raise money, induced me to address a letter to Mr. Edward Chapman, then the only surviving business partner in the original firm of Chapman & Hall, who first published the 'Pickwick Papers,' requesting him to inform me in writing whether the foregoing statement was correct. In Mr. Chapman's confirmatory answer, immediately written, he reminded me that I had given Mr. Seymour more credit than was his due. 'As this letter is to be historical,' he wrote, 'I may as well claim what little belongs to me in the matter, and that is, the figure of Pickwick. Seymour's first sketch,' made," says Mr. Dickens, "from the proof of my first chapter, 'was of a long, thin man. The present immortal one he made from my description of a friend of mine at Richmond.'"

—The problem of African discovery is still an exciting one, in spite of the fate which has befallen so many African travellers; for, as one disappears, another rises to take his place. The latest of these daring adventurers is Herr Gerhard Rohlfs, who proposes to go to Wadai, where his countryman, Edward Vogel, was murdered, in order to obtain his papers, which, he believes, are still in existence. Born near Bremen thirty-four years ago, Rohlfs studied medicine in the universities of Heidelberg, Würzburg, and Göttingen, after which he joined the Foreign Legion at Algiers; he distinguished himself at the conquest of Kabylia, where he was decorated and made a sergeant. Growing weary of military life, he resolved to travel—not in the beaten paths of your ordinary tourist, who "does" Europe in a few weeks, and so much of Africa as lies along the Nile in as many months, but through regions where danger as well as glory awaited him—in Africa itself, among its wild and murderous tribes. Knowing Arabic well, and being fitted by his early studies for the practice of medicine, he assumed the mask of a devout believer and the *rôle* of a physician, and boldly started forth on the track of adventure. In the end it was one of misadventure, for, four years since, while traversing the Sahara of Morocco, he was attacked and robbed by his guides, who left him for dead, with a broken arm, alone in the desert. Saved by some Marabouts, he was scarcely in Algiers again when he planned a journey to Timbuctoo, which he could not carry into effect on account of the unsettled condition of the country. Determined to do something, however, he has now started on what we cannot but consider a perilous journey to Wadai, taking with him a former servant of Vogel's, and an eye-witness of his death, which he came near sharing himself. This servant, Mohammed ben Sliman, maintains that Vogel's papers are in the possession of the present Sultan of Wadai, who is represented in a more favorable light than his predecessor. So, at least, Rohlfs thinks, and Mohammed ben Sliman likewise, or he would hardly have volunteered to accompany him on his journey. As Rohlfs had but scanty means with which to accomplish his object, the Royal Geographical Society of England have subscribed £100 towards his expenses, and it is probable that other European societies will also assist him.

—One of the sincerest poets of the time, and certainly its sweetest singer of sacred songs, died recently in the person of the Rev. John Keble, the author of "The Christian Year." Born towards the close of the last century, he was graduated at Oriel College, Oxford, in 1810. He was for many years professor of poetry in the university, but the latter part of his life was mostly spent in attending to his duties as a parish minister at Hursley, in Hampshire. A rigid ritualist, and an early and prominent leader in the High-Church party, he succeeded so well in his own parish—so perfectly, that is, in carrying out his ideas—that a Dissenter was unknown in it. The work by which Keble is best known, and which has passed through eighty editions in England, and probably a quarter of that number in this country, is "The Christian Year," which was published in 1827, and which carries out the system of the rituals in their extremest form, though often with a melody of versification and a richness of imagery unsurpassed in modern sacred poetry. It may be questioned whether any volume of merely religious verse ever had a wider circulation than "The Christian Year." Keble's subsequent works were two volumes of sermons, a metrical version of the Psalms, the "Lyra Innocentium," and the "Child's Christian Year." He was about seventy-six at the time of his death.

—Among the number of early English works which have of late years engaged the attention of scholars is that uncouth but earnest old classic, "The Vision of Piers Plowman," of which no satisfactory edition has yet been published, though what we hope will prove such is in progress under the editorship of Mr. Walter Skeat, who is now engaged in comparing the different versions of that poem for an exhaustive, which of course means a perfect, edition of it. He has discovered, so far, we are told, three distinctive types thereof: the original draft as represented by the oldest MS. known to exist, the Vernon MS. at Oxford, and those of later date which agree with it; the version published by the early printers, and recently edited by Mr. Wright from the earliest of the two MSS. at Cambridge; and the version published by Dr. Whitaker from Heber's MS., which has many variations from the Vernon copy and the early printed editions. A fourth type has lately been brought to light, consisting of the Vernon MS., which contains only the first half of the poem as we have it now, and Dr. Whitaker's version, which is rather awkwardly joined to it. From the abundance of the material before him it is to be hoped that Mr. Skeat will be able to furnish us with a reasonably good text.

OUR MILITIA.*

THE question of reconstruction so greatly overshadows every other that comparatively little attention is bestowed by the general public upon that of the militia. And yet, next after those of reconstruction and of popular education, there is no other in the whole range of our politics half so important. Gratified as everybody is by the way in which the crisis of 1861 was met, there are very few of us, indeed, who would like to be caught by any similar crisis again in a similar state of preparation, or rather of unpreparedness. The rising of that year was very great and noble; it was magnificent, from a moral point of view, but, as Canrobert said of the Balaclava charge, "that is not war." We have learned a lesson from the late struggle of the horrible waste of life and money there is involved in any exercise of the national strength, as long as that strength is not disciplined. And yet, in disciplining national strength, there is always the risk of doing more than is necessary, or, in other words, separating the armed force of the nation from the nation itself by converting it into a standing army. How to have the greatest number of good soldiers ready for active service without thereby diminishing the number of good citizens, is the great problem which every country which desires to preserve its liberties has to solve.

Colonel Lee, of Boston, discussed this subject over a year ago in the pamphlet before us, which has even greater interest now than it had when published, and which ought to be read carefully by every man who, while recognizing the fact that the growth of military science has made the training, disciplining, and arming of the national army a matter of the utmost moment, yet desires that the American army shall differ from that of all older countries in being a promoter of, and not a hindrance to, good morals, a support and not a danger to free institutions.

In discussing "What our militia has been and what it should be," he answers the following questions:

1. Whether we want a military force?
2. If so, whether it shall be a standing army, or militia, or both?
3. If we need a militia, is our system at present satisfactory?
4. If not, what improvement is practicable?

To show what our militia has been, and what were its defects, he quotes at great length from the speeches and letters of our ablest military men and statesmen ever since the foundation of the Government, as well as from the opinions of the best foreign authorities on the general subject of military organization. For the defects in the old system, we must refer the reader to the pamphlet itself. The remedies we shall allow Colonel Lee to point out himself:

A comparison of the comments upon the old system, and of the remedies suggested for its defects, leads me to the following conclusions:

1. That the militia must be reduced to a reasonable number.

* "The Militia of the United States: What it has been and what it should be." Boston. 1864.

2. That they must be uniformly organized.
3. That arms and equipments must be furnished.
4. That a system of tactics should be framed expressly for the militia, and books distributed.
5. That a general militia staff should be created, consisting of an assistant to each branch of the regular army staff.
6. That Congress should decide upon the exemptions from military service.
7. That officers elected should not be commissioned until pronounced upon by a board of officers, who shall examine into their qualifications; that their fidelity and success should be tested by inspections; that they should be obliged to hold their commissions a specified term before eligible for promotion, and before allowed to resign. That no commission above that of colonel should be issued in time of peace, unless required by State constitutions.
8. That the militia under arms should be subject to a rigid code.
9. That competent instructors should be appointed to instruct the commissioned and non-commissioned officers.
10. That the active militia should be compensated for service.
11. That rudimentary instruction in tactics should form part of the course in every public school.

That the unreasonable number of the militia was the primary cause of the failure of the system is self-evident, and all authorities concur in this opinion. The only question is, by what mode and to what extent shall that number be reduced.

The simplest plan, and one free from constitutional scruples, is for Congress to fix upon the number deemed adequate for present exigencies; to ascertain by the census, or by returns from the States, between what ages this number is included; and to pass an act limiting the military age in accordance. There are two objections to this mode, conclusive objections. First, to reconcile the citizens to serve in the militia for a few years in time of peace—such service, to render them efficient, involving a serious interruption to their necessary pursuits—you must reduce the number so interrupted to the minimum absolutely needed to secure safety to life and property in event of riots or any sudden emergency, leaving a reserve force to be called out in event of invasion, or insurrection, or any more permanent disturbance of the peace. But this scheme would deprive the Federal or State Government of any further support, by the enrolment of none but the active militia, and we should have to await the assembling of Congress, the passage of an act extending the period of service, the slow process of a new enrolment and a new organization, before the militia could be increased. Another objection to this mode of reducing the number would be the unequal distribution of the militia.

In some of the Western States, where the male population, and the younger portion of the male population, bears the greatest ratio to the whole, and where they are exclusively employed at home, and where, moreover, from the nature of their pursuits, the people are more scattered and military meetings more onerous, the number would be in excess of their needs in time of peace, and unreasonably oppressive; while, on the other hand, in the Atlantic States, where the proportion of males to females, of young men to old men, is the smallest, and where a considerable fraction of this small number are engaged in maritime pursuits, the force would be inadequate to suppress riots in our cities, or to meet sudden danger, more imminent on the seaboard than elsewhere.

It seems to me that the most practicable and equitable mode of reduction would be for Congress, leaving the enrolment as it stands and fixing upon the fraction they consider adequate, to enact that one-tenth or one-eighth, or whatever portion, *shall be trained*, leaving the selection of ages, between eighteen and forty-five, to the discretion of the States, and leaving it also optional with them to increase the number if their circumstances render it desirable.

By demanding active service of a fraction of the male population between eighteen and forty-five you distribute the burthen more equitably, and more in accordance with the needs of the States, than by exacting it of the same aggregate number, commencing at eighteen and ending at the age which would include such number. By leaving it discretionary with the States to demand service of any between eighteen and forty-five, you enable them to contract the military districts (and thus avoid one of the objections which have been urged against a classified militia), and to distribute the force more in proportion to their local needs. Some of the densely populated States with large cities might avail of the liberty to train a larger number than required by Congress. And by this mode of reducing the number of active militia you do not deprive yourself of the services of the larger number left on the roll when any possible circumstances render a larger force necessary. But is a classification of, or selection from, the militia within the power of Congress? It seems to me the power to provide for the organizing and disciplining the militia implies the power to define in some way the number to be organized and disciplined, and to distribute that number among the States in the mode Congress decide upon as the most equitable. We have high authority for the constitutionality of such an act—Hamilton, General Knox (or rather Washington), and Madison having severally advised the classification of the militia. They surely would not have urged a measure they deemed unconstitutional, however desirable it might have seemed to them.

Congress must arrange the militia into divisions, brigades, regiments. General Gaines and other military writers recommend that the organization of the militia should conform to that of the army. At all events it should be uniform throughout the States as to rank of officers, numbers of rank and file, numbers of companies in a regiment, etc., etc.

The militia being organized, the next duty of Congress is to arm and equip them, a measure now possible if the militia be reduced to four or five hundred thousand; although down to the second year of this war the supply was utterly inadequate. The old militia could not be fully armed, and the want of uniformity in the weapons they had was one of the many impediments in the way of their improvement.

The experience of this war will have indicated the needed correction of our system of tactics. There must be many officers of our regular or volunteer army competent to compile a simple, concise system, adapted to the wants of the militia, containing all the essential instruction in tactics, camp discipline, etc., and omitting all they need not attempt. Congress can print and distribute these books of tactics among the States, so as to establish an uniform system of drill and discipline.

SPIRITISM.*

THE pamphlet before us contains, in four chapters or lectures, a theory, with some details, of man, death, and the life after death, substantiated by the author's testimony to what he has himself seen in the "Summer Land." A selection of statements of fact will show what sort of things his disciples must believe:

"The churches everywhere are stealthily accepting and promulgating as their own long-entertained doctrine of immortality," the harmonial philosophy concerning "spirit." This will be news to those churches which have not modified their doctrines and symbols since 1845, when Mr. Davis published the "Revelations," his first book.

"*All* the important and refining sciences which verge on the spiritual have come up within the last quarter of a century." We apprehend that no science, either mental or physical, has originated since 1841.

"The light" (of the sun in photography) "instantly projects a shadow, paints your picture and, perchance, also that of a departed friend, on the susceptible surface of an insensate plate." The so-called "spirit-photographs" are here referred to as genuine. They were, however, unqualified impositions; every circumstance connected with their invention and production is authentically on record, and anybody who wants such can have them made by the thousand by any skilful photographer.

"I affirm, therefore, that there is no absolute imagination—that a total falsehood is an impossibility." Take now, for instance, Peter's absolute, repeated, and elaborate denial of any acquaintance with Christ; this, Mr. Davis says, was not a total falsehood.

"The spiritual world is made from life-points sent out from the chemical coalitions of the planets." Comment here seems unnecessary.

A fauna and flora of the spirit-land are described, which remind one of the story in the "Arabian Nights" about the talking bird, the singing tree, and the yellow water. Thus: "I saw celestial birds that excluded all rays except the yellow. They were singularly, wonderfully yellow—quite different from the hue of the canary." Well, a good article of gamboge is of a better yellow than a canary bird. Again: "I saw also a bird which excludes all rays except that of blue. I never could have imagined anything so marvellously expressive of pure, immense, heavenly love! This particular bird was a representative, I saw, of universal private affection. The yellow bird was also a representative. It had a great meaning—the mellower affection which comes from wisdom. The songs of these birds echoed from the Concilium"—a kind of council house. If Mr. Davis had, perchance, sought to steal the affections of the Swedenborgians or the thunder of their chief, he must have thus adopted the doctrine of correspondences. Further, the flowers here have corollas that "pulsate like a harp," and "every flower seemed to be conscious that it was part of a divine life and plan."

But, perhaps, the fairest specimen of this exposition will be afforded by a vocabulary of the Summer Land language, toward which Mr. Davis gives some materials. This language is in structure not unlike what is called on the Pacific coast the "Chinook jargon," a kind of composite gibberish or *lingua Franca* made up of Indian, English, French, and even, it is said, a word or two of Latin and Greek, and which serves as a common language for tribes, traders, and travellers on that coast. Some report that it consists of just one thousand words. Mr. Davis noticed with interest, he says, that many names of places in the Summer Land had Latin roots and Greek terminations, and ascertained, "by writing from the interior," that it is because "there is a kind of immortality in those languages," "more than there is in the Hebrew, the Arabic," etc. "The Asiatic *and* Chaldaic languages" were also somewhat used; and, safest of all philological ascriptions, there is what we may term a Turanian Aryan; "also the language spoken first on the American continent by the earliest inhabitants, by the aborigines, and those more singular people who preceded them." Truly, those who preceded the aborigines may well be reckoned singular. But Mr. Davis is surely wronging Max Müller in withholding from him the vocabularies and paradigms which could so easily be prepared of these primeval tongues.

* "Death and the After-Life. Three Lectures. By Andrew Jackson Davis. Also, A Voice from the Summer Land." New York: A. J. Davis & Co. 1866. 12mo, pp. 101.

In scrutinizing the following list, the just critic who shall find any dubious appearances will save himself some trouble by charging over every such case to the language of those singular people who preceded the earliest inhabitants on the American continent. But to our words:

Akropanamede, or "all-sided perfection," an island, which "takes its name from the purposes to which it is devoted." *Porilleum*, a spring on this island; *Porilla*, a group of such springs. The springs give off "exceedingly sweet musical sounds, which are full of unutterable significance." So is their name. *Hospitalia*, a temple where people are cured of any infatuated attachment to some one thing. *Apozea*, a "teacher-physician" of this place. On this vocable Mr. Davis observes with candor, "I never heard or saw such words before, and do not know whether they correspond with any earthly language." *Batellos*, another so named because some "educated Greeks" settled there. *Poleski*, *Alium* (Qu. *allium*, as if a heavenly Wethersfield), *Lonalia*, other islands. *Concilium*, Mr. Davis says, with the caution of an experienced scholar, "*I believe* means the temple of affectionate thought and practical wisdom." *Starnos* is a "beautiful mount," having on the west side of it "a celestial pavilion called by the beautiful word '*connilium.*'" *Ali-Nineka*, "the Turk, who is chief in that temple." *Apotravella*, a river flowing past it. This being a long word, Mr. Davis "obtained the pronunciation with great care." *Martillos*, wife of Ali-Nineka. The name means "morning devotion." *Zellabingen*, "a vast German association, located, in August, 1855," parallel with the rings of "Saturn with reference to the path of the sun." *Monazolappa*, an African association. *Ulcemira*, a female traveller, very beautiful and planeticose; hence, evidently the late Mrs. Ida Pfeiffer. *La Samosata*, a convent. *Archibulum*, a temple; the word means "white temple of the children." It is "a vast white flower." *Aurealia*, a class of pulsating lilies, which "represent new hopes." *Vasciel* means mind or spirit; *Plana de Alphos*, a holy brotherhood; *Voralia*, a rose; *Pantrello*, a group of hills; *Gandulea*, a flowering tree; *Zona*, a visitor; *Baskatella*, a bird.

But enough, and more. We quote one sentence, showing how this language mingles with English:

"Advance, my baskatella, for thou art our beloved Opeathalos (student), and the time future is thine to become whatso thou wilt; for thou art even now fit to stir within others the power of thought, and to meditate with the happy Paralorella (half-cured patients). The distant pantrello will invite and teach thee to comprehend thy God, hid within the fragrant voralia and the musical porilleum."

Upon pronouncing all these words in a row, it is evident that, while they are philologically remarkably pure and perfect specimens of nonsense, they are vocally evidences of a sensitive ear in Mr. Davis, being full of open vowels, liquids, and soft mutes. The talk about Greek and Latin is comical, and the interpretations as sapient as that given by the fool in "Quentin Durward" of the coat-of-arms which puzzled the gipsy Hayraddin: "This, my lords and masters, represents the cat looking out at the dairy window."

It would be a great waste of space to say all this solely about the little pamphlet before us. But many thousands of minds are all the time swallowing such east winds. What many people do is significant, whether the significance be good or bad. Such traits as are above enumerated belong more or less to the whole mass of spiritist literature, and it is better to recognize this literature and judge it justly and treat it so, than to pretend that it does not exist and to say nothing about it. So far as knowledge is concerned, or depth of thought, or truth, in fact, it is utter nothingness. The crudeness and ignorance and inconsecutiveness of its theories and reasonings, the baselessness of its accusations and assertions, the barbarousness of its conceits and devices, the cool absoluteness of its irreligion, are wonderful. But it is by no means altogether silly, nor altogether bad. Both spiritist teachings and spiritists are on the whole kindly and peaceable in demeanor and demonstration. They profess to work by love, and they assuredly do so in great measure. They belong to that school of thinkers, or rather pathetists —*feelers* is the word needed, for their mental exercises are emotion rather than thought—whose inner life is chiefly active in dreaming and wondering. Their type is a mind which instinctively believes any wonderful story because it is wonderful, without reference to the question of truth. And the great number of spiritists shows how important and powerful a radical faculty is this instinctive appetite for the marvellous, purely as such.

Readers improve. Librarians testify that those who begin with silly stories most commonly advance to better ones, to biography, essays, travels, and so on, in a rising series of really useful reading. Let the mind be awake and active, and—under American Christian civilization, at least—it gravitates upward. Spiritist literature is studied by those who neither could nor would for the time being study any better literature. In time they will leave off such pap and learn to receive the solid food of adult minds.

ANDREWS'S SOUTH SINCE THE WAR.*

THE course adopted by Mr. Andrews in the republication of these Southern letters is such that all criticism of his work as a literary performance would be out of place and unfair. It is simply that a travelling correspondent has taken the forty or fifty letters which he sent to two daily newspapers, one in Boston and the other in Chicago—letters written in the midst of fatiguing travel and mailed at short intervals of two or three days—and has thrown them into the form of a small volume.

Considered as newspaper correspondence, the letters are worthy of high commendation. The correspondent, who has been for some years connected with the press, was a New England Yankee, it seems, on a three months' trip in the Carolinas and Georgia. After reading his book one would say that he is apparently a man of intelligence, of kindly sentiments, honest, shrewd, and fair-minded. If not without some tincture of prejudice, at any rate he has no prejudices that are violent or incurable. To this fitness he adds the further qualifications for his work that he possesses the quick, observant eye of a practised reporter, the reporter's facile, if somewhat careless, pen, and the reporter's eagerness for collecting facts. In his search for useful information he sometimes shows, too, the true reporter's instinct for that particular sort of information which is useful to the newspaper editors mainly. This is pleasantly illustrated by a passage—properly italicized—which occurs on page 358. All the Washington-despatch writer is seen in it; the man who scents a coming item while yet it is weeks distant, hidden in the breast of some inaccessible secretary or committee-man; who night and day pursues his object with taciturn perseverance, baffling rival correspondents by simulated ignorance and nonchalance that conceals anxious fear; and at last, with trembling satisfaction, hours before any one else can, telegraphs intelligence that some collector is appointed or some new bill is to be introduced. It is of Alexander H. Stephens that he is speaking:

"While in Columbus, two weeks ago, I was told of a letter he wrote to a friend in that city immediately after the famous Hampton Roads conference. I tried in every way to get a sight of it, but without success. The gentleman who told me of it had read it, and used these words in respect thereto: '*He said that peace could be obtained on terms not humiliating to the South, and that it ought to be made at once, but Mr. Davis and his principal advisers did not want peace.*'"

Apparently, Mr. Andrews's chief object in making his journey was to be present at the sessions of the constitutional conventions in the three States which he visited. Nearly one-third of his pages he devotes to this subject, and the summary which he gives of the proceedings in those assemblies is exceedingly clear and far more readable than any account of them which has been printed elsewhere. This part of his book is very creditable to his abilities as a reporter. But of course he is more interesting when he treats of what he saw and heard among the people. His descriptions of the old prison-pen at Florence; of the miserable hotel at Orangeburg, with its deplorable housekeeping and dirty, shiftless landlady; of a scene in a railway car where he was snubbed and insulted by a young lady because he, being a Yankee, had presumed to think that a Southern woman would speak to him; of the attempt made in the town of Albany to lynch him—all these are so interesting in themselves as being a part of the South and of Southern society, and are so well done, as to make us regret that the incidental business of this journey was not suffered to displace the main business. The South in convention last fall was on its good behavior; our author got a somewhat truer view of it in the streets of Albany and among the Carolina planters.

The conclusions at which he arrives are those which might be expected from a New Englander, intelligent, acute, orderly, industrious, a democrat by nature and by training, and accustomed to the largest measure of liberty consistent with the requirements of law. They are drawn from an experience of only three months, and some of them, we think, may have been drawn too hastily. The problems presented by the condition of the negro, by the work of reconstruction, by the prospect of the future social life of the South, are not to be solved in haste or heedlessly. But the general correctness of the writer's opinions is amply confirmed in most points by the direct testimony, or by easy inferences from the testimony, of nearly every recent witness from that part of the country—from Lee and Stephens down to the most obscure traveller.

He "went South to study the political situation," he says; he tried to be impartial, he meant to tell the truth, and he hoped to find the truth pleasant to tell. Yet the conclusion of the whole matter is "that a very grave mistake, not to say a criminal blunder, has been committed, if the Southern

* "The South Since the War, as shown by fourteen weeks of travel and observation in Georgia and the Carolinas. By Sidney Andrews." Boston: Ticknor & Fields. 1866. 400 pp.

representatives have been admitted to Congress." This was written on shipboard in the first week of December last.

"It must be said that public sentiment is changing very rapidly in the South and not wholly in the right direction. The President went to the extreme limit of magnanimity, but the more he gave, the more was demanded. . . . The endorsement of President Johnson, of which so much is said in their newspapers, is merely a grateful sense of favors received."

"Any Northern man is sure to find his principles despised, his people contemned, and himself subjected to much disagreeable contumely; while any man holding and openly advocating even moderately radical sentiments on the negro question stands an excellent chance, in many counties of Georgia and South Carolina, of being found dead some morning—shot from behind, as is the custom of the country."

"The leading men generally invite immigration and are honest and sincere in their desire for the influx of new life." With the masses it is not so.

"Nine of every ten white men in South Carolina had almost as little to do with even State affairs as the negroes had. . . . Till civilization has been carried down into the homes and hearts of all classes we shall have neither regard for humanity nor respect for the rights of the citizen."

The writer has no fear that the people of the South can ever be brought to renew hostilities.

"But," he adds, "there are things quite as bad as open war; and one of these is a sullen and relentless antagonism to the idea of national sovereignty —from which will breed passionate devotion to local interests, unending persecution of the freedmen, never-ceasing clamor in behalf of State rights, and continual effort to break away from the solemn obligations of the national debt."

When one man listens to another talking politics, especially when politics are talked so emphatically as in the South, it is not hard for him to understand what the speaker thinks and what he would do if he could. But to understand the whole character and capacity of a people something more than this is necessary. One must live with them. As the New England farmers say, "Summer him and winter him, and you 'll see." Mr. Andrews's generalizations upon the negro we receive with a good deal of doubt:

"The negro loves idleness, he has little conception of right and wrong, and he is improvident to the last degree of childishness. . . . . He is anxious to learn, and is very tractable in respect to minor matters; but we shall need almost infinite patience with him, for he comes very slowly to moral comprehensions."

Of course it is among the possibilities that Mr. Andrews may be right —right in respect to the laziness, the improvidence, and all the rest. And of his good-will toward the negroes there can be no doubt; we only say that in this matter he has spoken too soon and too positively.

"The old masters," he says, "grant the negroes nothing except at the requirement of the nation, as a military or political necessity; and any plan of reconstruction is wrong which proposes to at once, or in the immediate future, substitute free will for this necessity."

We can very cordially commend these letters to the public. Much may be learned from them that it is well for all to know, and they are also entertaining. To "Dixon" himself, whose daily letters we have long read with pleasure, and whom we regard as being in many respects a model that other reporters and despatch writers would do well to copy, we would address one word of expostulation:

"Columbia is in the heart of Destruction. Being outside of it, you can only get in through one of the roads built by Ruin. Being in it, you can only get out over one of the roads walled by Desolation."

This and similar strokes, scattered, thinly scattered, we are glad to say, throughout the book, do indeed recall vividly the wild and lurid genius of George Lippard. And there was once a time when George Lippard, also, we read with pleasure. But in the prevailing soberness and sensibleness of style and matter which honorably distinguish this book from the common run of newspaper letters, do not such passages seem a little incongruous, and in themselves are they not a little ridiculous? Misplaced eloquence is bad, but misplaced magniloquence is too bad.

TWO VOICES FROM "MY MARYLAND."*

We are disposed to believe that Mr. Grant White will regret the premature publication of his "Poetry of the War" should he ever fall in with the volumes recorded below. Gen. Hayward's, to be sure, is now two years old, but, being far less elegantly printed than the other, and meant not to be sighed over by Southern dames, but to inspire the "hoarse, unfeathered nightingales" of the camp, and being withal a little careless in language and versification, we fear our Shakespearian scholar must have slighted it; for we will not assume that he overlooked it. As for Mr. De Leon's compilation, it is fresher from the press than Mr. White's. The author of the one set of songs and the compiler of the other are, we infer, both Baltimoreans, but we are spared the necessity of inferring that they took opposite sides in the late civil war—the one actively, the other at least sympathetically; and it is worthy of remark that Mr. De Leon had the delicacy to engage a Northern publisher for sentiments not always complimentary to Northern character or to the Northern purpose in accepting the gage of battle. It must be acknowledged, however, that he has toned his collection as inoffensively, perhaps, as was compatible with his desire to give it an historical value. The most stately specimen of misrepresentation is contained in "A Ballad for the Young South:"

"The saints of Cromwell rise again,
In sanctimonious hordes,
Hiding behind the garb of peace
A million ruthless swords.
From North, and East, and West, they seek
The same disastrous goal,
With CHRIST upon the lying lip
And Satan in the soul!
Mocking, with ancient shibboleth,
All wise and just restraints:
'*To saints of Heaven was empire given,*
And WE, *alone, are saints!*'"

Mr. De Leon gives vent in his preface to his astonishment at the ignorance of the North concerning the "high order of poetry" which the war evoked at the South. His careful gleaning has embraced nothing, we will allow, that is strikingly mediocre, or metrically faulty, or excessively florid, or intolerably surcharged with "chivalry." It is unfortunate, however, that some of the very best pieces are anonymous, and of that neutral description that would make them as appropriate for this as for the other side of Mason and Dixon's line, or, indeed, for any nation involved in war. The horrible suspicion will also haunt the reader that some to which the authors' names are appended have become "original" simply by the substitution of one name for another to change the local coloring. In the doubt, however, let us praise "The Burial of Latané" and "Ashby," as if they were John R. Thompson's own, and quote, from his "England's Neutrality," a paragraph from a supposed speech of Earl Russell:

"'The grim bastile, the rack, the wheel, without remorse or pity,
May flourish with the guillotine in every Yankee city,
No matter should Old Abe revive the brazen bull of Phalaris,
'T is no concern at all of ours'—(sensation in the galleries)."

And let Harry Flash (Phœbus, what a name!) dismiss us with a stanza on Jackson, in which a new claimant appears for a fashionable title:

"He entered not the Nation's Promised Land;
At the red belching of the cannon's mouth;
But broke the House of Bondage with his hand—
The Moses of the South!"

The loyal Baltimorean is an uncouth but not despicable rival of his disloyal fellow-citizen. He violates rhyme, rhythm, metre, grammar, good taste, politeness, but he writes with a hearty good-will and once in a while like a genuine bard of the people. He has adopted on his title-page the well known sentiment: "Let me write the songs of a nation, I care not who makes its laws"—which he cannot resist printing as a distich. To be frank with him, we should prefer him as a song-maker rather than as a lawgiver. Arranging his expressions as nearly as we can in chronological order, we get at his notion of the true policy on the eve of secession:

"Let us have no more agitation
About the nigger—stop cry and hue—
Then prosperity will bless this great nation,
And every happiness, too."

A little later:

"Let justice be our pride and boast,
Dividing lines be henceforth lost;
Repeal all laws that are not wise,
The South has rights no one denies.

. . . . . .

Can no compromise avail?
Shall this great Republic fail,
As transmitted by our sires?
Divide the Union—Hope expires."

At this moment, fortunately, there looms up "Kentucky's son, the statesman, patriot," and elicits the following wish and prophecy:

"May the North and the South dwell as brothers,
On Crittenden's platform stand true,
His principles never will perish,
His compromise meets every view."

And at New Year's, 1862, the gallant general could still write:

"Extremists from the South and North
From happy States brought misery forth;
And politics, great bane of all,
The first true cause of our downfall.

"Secession, abolition dire,
Blast like a wild consuming fire,

* "Camp Songs for the Soldier, and Poems of Leisure Moments. By Gen. William H. Hayward." Henry A. Robinson, Baltimore. 1864.
"South Songs: from the Lays of Later Days. Collected and Edited by T. C. De Leon." Bielock & Co., New York. 1866.

Turn men to fiends, this land to blood,
Sweep on, a devastating flood."

We like better his terms of reconstruction after Antietam:

"Let Charleston, Savannah, and every Southern city,
Hurrah!
Lay down arms, send flag of truce by a loyal committee,
Hurrah!
Beg pardon, say they 're sorry for what they 've done,
Pay the costs, shake hands, and swear allegiance at Washington."

It is in this same poem of fifty-seven stanzas, by the way, that the refrain is varied not unpleasantly to suit the historical allusion:

"Nineteenth of April, Massachusetts blood did run,
Can't hurrah over that!
John Kettlewell said it was a second Lexington,
Hurrah!
The clubs and paving-stones in showers fell thick,
Southern hospitality in the shape of a brick."

We have said that the general sometimes violates good taste and polite manners. Take the following, perhaps excusable, instance:

"We hate the sight of a rebel cuss;
From such, good Lord, deliver us."

Elsewhere he declares—

"He proved them to be most darnation liars;"

and, still more profanely,

"Kane said he be d—d if that was fair."

But we are bound to add that Gen. Hayward scrupulously prints "jack-ass" with dashes, whenever he is constrained to apply it to an individual of the *genus homo*.

As for humor, we are at small pains to find it; as in the comical lines which relate of a certain spy that

"To be crammed in a bureau in July hot season,
Was considered by the cabinet-makers misprison (*sic*) of treason."

And in this parody:

"Why should we mourn, conscripted friends,
Or quake at draft alarms?
'T is but the voice of Abraham,
To call you out to arms."

Or, borrowing our illustrations from the "Poems of Leisure Moments," and another parody contained in them:

"Here my mother washed my face,
And scrubbed my little hand;
Forgive this foolish tear,
But let that old pump stand!"

and, quite innocently, of Burns:

"Whilst some are reared in halls of state,
Pampered and feasted by the great,
Misfortune seemed his cruel fate—
An exciseman was he."

There is no poet who has not been reproached for refining and polishing away his verses, and Gen. Hayward is by this sign certainly a poet. Being not above repeating what he thinks he has written well, he prints on page 44 these lines:

"Oppression's chains cannot enslave
The patriot's sturdy arm;
We are the bosses of this land
Called Uncle Samuel's farm."

and on page 75 they re-appear slightly modified and a good deal diluted, thus:

"Oppression's chains cannot enslave
Columbia's brawny arm;
We are the *sovereigns* of this land
Called Uncle Samuel's farm."

So much for prelude. Now for proofs of a capacity to write ballads almost of the flavor of "Percy's Reliques" or the "Minstrelsy of the Scottish Border." First let us reproduce *in extenso* this feeling little poem, which stands well enough without the incident on which it was founded:

"Soldier! are you hungry?
This thing cannot be,
When you're marching—fighting
For my Flag and me;
Come with me to father,
He will treat you right,
His house is always open
To the men who fight.

"We have full and plenty,
Soldier! come along—
Bring your comrades with you,
Union right or wrong;
We that stay at home
Out of harm and danger,
Must do all we can
For the soldier stranger.

"You will find our dwelling
By the flag before it,
Father keeps it waving
So secesh may know it:
Oh! how we love that banner—
Old red, white, and blue,
Die for that, no other—
Never own the new.

"So come along to father—
He 's the soldier's friend,
He will make you welcome,
And each one you send;
Every loyal heart
Must assist each other—
The man who wears a uniform
We love as any brother."

Best of all is the story of "the patriot Ishmael Day," with which the book opens, and from which we shall take the liberty of striking the first verse and the two last verses, which mar its naturalness:

"One Monday morn, at early dawn,
The hour when good men pray,
A Rebel host, with threats and boast,
Came on to scare old Day.

"He soon had word—the noise he heard
In the distance far away,
That Gilmor's men were coming then
To capture Ishmael Day.

"That 's what 's the matter—oh, what a clatter!
I 'll keep them awhile at bay,
Till I hoist my flag, of which I brag—
Said the brave old Ishmael Day.

"On rushed the crowd, with curses loud,
Begrim'd with dust and grey;
My flag I 'll nail to the garden pale,
And die by it, said Day.

"The thieving horde came down the road—
They had no time to stay—
'Our flag is here—touch it who dare,'
Shouted old Ishmael Day.

"A trooper rushed, with whiskey flushed,
Swore he 'd take that rag away—
Let any man dare try that plan,
I 'll shoot him, says old Day.

"He feared the cock of his old flint-lock
Might miss, so this prayer did say,
That a load of buck-shot might pepper him hot
By the hands of Ishmael Day.

"On the raider came—old Day was game—
Reb swore that flag should n't stay,
With a curse and a frown, cried, down with it, down,
Bang! blazed away Ishmael Day.

"Flint-lock he could trust, for down in the dust
The traitorous rebel lay,
Crying, spare my life, I 'm tired of this strife—
So am I, said Ishmael Day.

"Now let each loyal heart in our cause take a part,
Do his duty—watch, fight, and pray,
Shoulder his gun, stand by, never run,
And imitate Ishmael Day."

This is among the few real ballads which the war has produced. If it and other of these songs were popular in camp, the Union cause owes much to their soldier author, who, in satisfying his comrades in arms, has also exacted recognition from truly critical minds. It is pleasant to be able to add that the old hero has just been voted an annuity by Congress.

THE NEW MAGAZINE.

A NEW fortnightly magazine, the "Galaxy," has just made its appearance in New York, its *raison d'être* being, we believe, partly a "divine discontent" which prevails in these parts with regard to the "Atlantic Monthly," and partly the feeling, also widely diffused, that New York ought to have a monthly of its own, no matter how good the Boston magazines may be. To us the only good reason for the existence of a magazine or of any other periodical in one place more than in another is that it can there be produced of a better quality, or that, proceeding thence, it can exercise a wider influence. The desire of particular places to have publications of their own for the glory of the thing we have no sympathy with, and nothing very good was ever born of any such feeling; but we honestly confess we think the "Atlantic Monthly" would be the better of a competitor, and that, good as it is, it would be improved by the public having something to compare it with. Whether New York is able to compete with Boston in the production of magazines, remains still to be proved, and we are very glad to see the experiment tried, and wish the publisher of the "Galaxy" all possible success in it. But we warn him that a good magazine has hardly ever flourished out of a literary atmosphere; this has still to be created in New York—perhaps will have to be created by the magazine itself. Literature is not in any great favor here, and literary men do not abound. The moneyed world, which is the ruling social influence, bestows most of its favor on art, as art is a thing much more easily cultivated and makes

much less demand upon the time, and contributes much more to ornamentation; so that a literary society has still to be made, and, until it is made by some means or other, New York magazine publishers will have a good deal to contend with. Nothing interferes more at present with the growth of good magazine writing than the popular impression that "light articles" are things that can be "thrown off," as it is called, almost without effort. There are few people who make any pretensions whatever to literary skill who do not flatter themselves that they can sit down any evening after dinner, or get up any morning an hour earlier than usual, and produce something "spicy" that any editor might be glad to get. But there never was a greater mistake. There is nothing which requires more culture, more social experience, and keener perceptions than the composition of a first-class magazine article, and the men who produce it find it no child's play.

As we consider the practice of treating the first numbers of new periodicals as fair specimens of what they are to be, and condemning or praising the enterprise accordingly, to be a very absurd one, we shall only say of the 'Galaxy" that its appearance is very attractive, the cover being a stroke of genius, and the contents look promising. The first engraving is American, by Darley, but has a most English look. The ploughman is an unmistakable English hind, taking a pot of ale, and the illustrations to "The Claverings" are, of course, foreign; the appearance of the bridegroom is pitiable. "Nebulæ," in which the editor discourses of things in general, is well written, and, altogether, we think it is safe to predict for the magazine both improvement and success.

"CAMPAIGNS OF A NON-COMBATANT."*

In this book it is possible to study exhaustively the natural history of the New York reporter. He is to be seen here nascent, developing, and fully grown, in action and in repose. Some may look upon the "Campaigns" as being not so good a manual for this purpose as the same author's account of the capture of Wilkes Booth and his description of the trial and execution of the other conspirators. But here we have him under our eye for a much longer time than we can have him there, and we get sight of more sides of his nature. For the use of careful students, the "Campaigns" is certainly to be preferred. Reading it, we see how the reporter is made. We become acquainted with his mental and moral characteristics; we learn what are his aspirations; we take the measure of his attainments; we perceive the force of his imagination, his wit, his taste, his sense and judgment, his knowledge of life, his conceptions of morality, his sense of what is decent and of what is not becoming.

The reporter is the offspring of the daily press and shares the nature and the life of his parent; his existence, to use the words of our author, "is only the fierce, fast, flippant existence of news. The day I graduated," he goes on, "saw me an *attaché* of the Philadelphia *Chameleon*. I was to receive three dollars a week and be the heir to lordly prospects." He was but eighteen years old at that time, and knew nothing of the life before him. Full of enthusiasm, fired by the example of Horace Greeley, he little suspected how soon he would become "indurated," as he puts it, and cynical, nor how good a reason he would have for becoming so. He could not foresee the manner of his life; that his love of nature, for example, to say nothing of a man's natural desire for a short vacation in the summer, it would be impossible to gratify; that "all places would be workshops—the sea-side, the springs, the summer mountains, the cataracts, the theatres, the panoramas of islet-fondled rivers speeding by strange cities." He would hardly have allowed himself to pass from the condition of an exchange-clipper to that of a full local reporter if he had known that after he had "ridden at Hoe speed down the groove of his steel pen for five years," he could give no more favorable description of his life and himself than this: "Never nepenthe, never *abandonne*, always wide-awake and watching for saliences," compelled "to go abroad like a falcon, to roam at home like a hungry jackal. Six fingers on my hand, one long and pointed and ever dropping gall; the ineradicable stain upon my thumb; the widest of my circuits, with all my adventure, a paltry sheet of foolscap; and the world in which I dwell no place for thought, or dreaminess, or love-making. Like Sinbad, to a terrible old man I have sold my youth, my convictions, my love, my life."

But though, to use a phrase of his own, this slave of the press may sometimes have repented with "the salt rheum in his eyes," generally he hugged his chain and was proud of it. The war broke out, and he was at once sent to the Army of the Potomac as special correspondent of a Philadelphia newspaper. But the reporter is not a stone that never rolls. He "sent an indiscreet paragraph to the Washington *Chronicle*," he says, "for which I was pursued by the War Department, and, the management of my paper lacking heart, I went home in a pet." Soon he used this opportunity to make his escape from what he calls "the provincial journals." New York was the goal of his desires. "It is the end of every young American's aspiration, and the New Bohemia for the restless, the brilliant, and the industrious." "The dream of many months came to be realized;" some New York paper despatched him to the front. It was a business that called for haste: "At six in the morning I embarked; at eleven I was whirled through my own city, without a glimpse of my friends; at three o'clock I dismounted at Baltimore, and at five was gliding down the Patapsco under the shadows of Fort Federal Hill and the white walls of Fort McHenry;" and he adds, "The latter defence is renowned for its gallant resistance to a British fleet in 1813, and the American national anthem, 'The Star-Spangled Banner,' was written to commemorate that bombardment." We will not follow him through the adventures of the next twelve months. That would teach us the life of a special reporter in time of war. We should learn much about "Bohemia; this roving commission, these vagabond habits, this life in the open air among the armies, the white tents, the cannon and the drums, which were my elysium, my heart." But what we are more particularly looking for now are those essential characteristics which make the reporter and are independent of time and the flux of circumstance.

These are clearly revealed. We have seen the easy way in which he can introduce the facts of history. Here is a sample of the reporter's general reflections. Some old negro women sell cakes and buttermilk to the soldiers: "Poor, mortal, sinful old women!" he moralizes, "one would have thought that they had outlived the greed of gold. But wages deferred make the dying miserly."

Here is the flight of imagination: If McClellan and Magruder had fought at Yorktown, "beautiful but awful must have been the scene. One might almost have imagined that man, in his ambition, had shut his God in heaven, and besieged him there."

And here is the description of natural scenery. Professor Lowe takes the reporter up in a balloon: "It was just seven o'clock, and the Park lay like a veined and mottled bloodstone in the red sunset. The city wilted to the littleness of a rare mosaic pin, its glittering point parting the blue scarf of the bay, and the white bosom of the ocean swelling afar, all draped with purple clouds like golden hair, in which the entangled gems were the sails of the white ships."

From the same chapter we may take a fair specimen of the true reporter's wit: "Lowe was opening a bottle of Heidsick, and three or four gentlemen with *heads sick* were opening the petals of their lips to get the afternoon dew."

Here is an animated description: "At this point he took off his glasses and wiped his face; the water was running down his cheeks like a miniature cataract, and his great neck seemed to emit jets of perspiration."

Here see his mastery of English. He rides in a railway car and "is invited to drink by many persons. But the beverage proffered was intolerably bad, and several convivials became stupidly drunk. A woman in search of her husband was among the passengers, and those contiguous to her were as gentlemanly as they knew how to be."

Hearing a profane officer talking, he remarks: "He strutted off like Bomba or the Czar. I thought I never beheld a more exceptional person in any high position."

The reporter visits a hospital, and sees "the open lips through which one could almost look at the quaking heart below, the ghastliness of brow and tangled hair; the closing pangs; the awful *quietus*. I thought of Parrhasius, in the poem, as I looked at these things:

> "Gods!
> Could I but paint a dying groan . . ."

But what shall we say of the assertion of the preface: "No man ought to let the first four years of his majority slip away unrecorded?" We never heard this maxim before. If Mr. Townsend really believes it to be true, of course he is justified in publishing this book.

FLINT'S PRACTICE.*

To the medical man erudite in the literature of his profession, or so long engaged in its practice as to depend solely upon his experience, the present book may be of less interest; but those to whose use its title-page dedicates

* "Campaigns of a Non-Combatant and his Romaunt Abroad during the War. By George Alfred Townsend." Blelock & Co. 16mo, pp. 368.

* "A Treatise on the Principles and Practice of Medicine; designed for the use of Practitioners and Students of Medicine. By Austin Flint, M.D., Professor of the Principles and Practice of Medicine in the Bellevue Hospital Medical College, and in the Long Island College Hospital; Fellow of the New York Academy of Medicine, etc." Philadelphia: Henry C. Lea. 1866. Pp. 867.

it will certainly find it a most valuable acquisition. The works on practice most in vogue in this country of late years have been that of Dr. Watson, of London, and that of Dr. Wood, of Philadelphia. The former, while it may long remain a favorite for its many excellences, and pre-eminently for the charm of its literary style, is now somewhat obsolescent. The latter, though possessed of considerable merit, especially in point of nosology, is felt by the more judicious and advanced practitioners of the present day to be, as regards treatment at least, quite erroneous and harmful. Most of the other books in use are either incomplete—for example, the excellent clinical lectures of Dr. Bennett or Dr. Chambers—or are too costly to find a place on the shelves of every medical man. So far as the student is concerned, the latter objection applies as well to extended monographs.

There has, therefore, been a generally expressed desire on the part of students and junior practitioners for a work which should be convenient for use, yet embodying the results of the later researches in pathology, and, more than all, that change in the treatment of disease which the last twenty years have effected. To meet this want, as the preface tells us, the book before us was undertaken. It makes no pretense of being an exhaustive statement of the present state of medical knowledge, but simply claims to be a practical manual. It appears to be, and doubtless is, an extension and elaboration of the course of lectures which the author, in his long career as an instructor, has found best adapted to the wants of students.

Our limits will allow but a passing glance at the contents in detail. In "Part I., The Principles of Medicine or General Pathology," morbid anatomy, blood changes, etiology, symptomatology, prophylaxis, and general therapeutics are concisely discussed. "Part II., The Practice of Medicine or Special Pathology," is divided into sections according to the various systems of the organism—*e. g.*, the respiratory, circulatory, digestive—with a final section on "fevers and other general diseases." This method is as little arbitrary as any available. Attempts have been made to found a classification upon pathology, but in the existing state of that science such arrangements shortly become unmanageable. The plan here adopted has the advantage of placing in juxtaposition the diseases between which discrimination is most likely to be required in diagnosis. The writer attempts to carry out more perfectly than is generally done the regular nomenclature of disease, and, in so doing, some time-honored names have been dismissed from service and their places filled by others more adequate.

The sections on the diseases of the respiratory and circulatory systems are especially valuable as being a succinct, clear, practical account by one qualified for this task by a lifetime of special study, and whose previous writings on these affections have gained a wide reputation. But no undue prominence has been given to these departments. The diseases of the digestive system are treated of with equal fidelity and care; and under this head is placed that disease which is now exciting so much popular interest—cholera—for which the author warmly advocates the opium treatment. In the section on the nervous system are given the essentials of what is definitely known in this intensely interesting but slightly explored field of study. The article on fevers contains an abstract of the investigations lately carried on abroad as well as in our own immediate vicinity.

The typography of the work we certainly cannot commend; not that it falls below the average of American medical books, but that it has not surpassed it. Somehow the impression appears to have taken a firm hold upon the minds of publishers that the profession cannot appreciate or does not deserve the luxuries of the typographic art. In the present instance it may be urged that to have given a clearer type or broader margin would have made the volume so large as to defeat its very object.

How to Study the New Testament. By Henry Alford, D.D., Dean of Canterbury. (Alexander Strahan, London and New York.)—The opening pages of this volume read so pleasantly that one is tempted by a doubt whether it is not as a poet rather than as a critic that the dean excels. This doubt is justified by the main part of that which follows, and yet if everything is not said wisely, everything is said in a good spirit. The first thing necessary to a faithful study of the Scriptures, we are told, is faith. We must approach the Gospels from the side of trust and love, not from that of distrust and unchristian doubt. Such statements by themselves are well enough, but with the context they too evidently mean that we must take for granted at the outset the one great question in dispute. It must be borne in mind that this book was written for the people. Dean Alford would not think of giving scholars such advice. But he should not forget that the people are becoming scholars, and will not always be put off with food that scholars could not be induced to eat. The writer would have us go to the New Testament resolved to find there nothing but the truth. But he does not indicate why this should be done. On the contrary, he makes a great many admissions which go to prove that it should not be done; but that the New Testament should be regarded, so far as criticism of it is concerned, as a purely human composition. Besides the introduction, the book contains a chapter on each of the four Gospels, three chapters on the Acts of the Apostles, two on the resurrection. The chapters on the Gospels and the Acts contain revised translations of a great many passages which in King James's version are translated incorrectly, together with an account of those readings in the best manuscripts that differ widely or considerably from the received version. These are the most valuable portions of the book. They are, in themselves, sufficient proof of what the dean asserts, viz., that we ought to have a new translation of the New Testament at least. A few years ago he thought the time for this had not arrived, but now he is convinced that there is danger in every minute of delay. "Let a commission of men learned in the Scriptures be appointed, chosen from among our different Christian denominations, with definite powers as to this weighty matter." We cannot think of any single step that would advance so much the cause of Christian truth. And it is of little use for individuals to work alone in this matter while the Church as a whole frowns upon their labors and does its best to prejudice the popular mind against them. We thank Dean Alford for his earnest word. Coming from him it cannot fail to make a good impression. And not only will his book correct a multitude of errors, but it will create a taste for further investigation. Were we not certain of this, we should regret even more than we do now that the dean has chosen to ignore so many questions the asking and the faithful answering of which would have lighted up many pages of his volume which, as at present written, are in a midnight of obscurity. The printing of the book is excellent and its whole appearance very elegant indeed.

The Lost Tales of Miletus. By Sir Edward Bulwer Lytton. (Harper & Bros., New York.)—The title of this little volume might lead one to suppose that the gifted baronet had recovered, or believed he had recovered, the famous Milesian tales, which are now commonly reported to have been the distant progenitors of the modern novel. Such a notion would be mistaken. Sir Edward agrees that those ancient fables are hopelessly lost; but he does not despair of reproducing something like them, as Lord Macaulay, in his "Lays of Ancient Rome," hoped to reproduce something like the earliest heroic ballads of the city. Hints in regard to the character of the Milesian stories are given in many places. Some of the original myths on which they were doubtless founded are extant, in the collection of the poet Parthenius and elsewhere, while Apuleius, in the romance of the "Golden Ass," furnishes, according to our author, some idea of the manner in which the primitive rude fables were worked up in literary form. Assuming so much as fairly conceded, or concessible, Sir Edward, who is determined to leave no species of literary effort untried, goes to the repertories of ancient legend, gleans in the Scholiasts, turns over the pages of Pausanias and Athenæus; and with the help of such indications of the character and genius of the lost Milesian fables as Apuleius can furnish, weaves together a few stories "as feeble specimens of the various kinds of subject in which these ancestral tale-tellers may have exercised their faculties of invention." The stories in the volume are eight in number—all good; all interesting; some very beautiful. They are well told, too; strongly, simply, with spirit, and with not too much grace for the period in which he supposes them to have been written. The treatment is more chaste than the age he dates them at would have warranted, we think; but this is done in necessary deference to modern taste, and to the choice of subjects, which was made carefully with a view to their moral purity.

Especially noteworthy is the form in which the tales are cast. The Milesian stories were told mostly in prose, though the poetic treatment was allowed in the case of poetic themes. Sir Edward chooses the form of verse unrhymed, because rhyme would be inconsistent with the antique character which he means to preserve. But in order to obtain variety, the lines are not measured off in arbitrary lengths, as is common in blank-verse, but are broken up, on very simple principles of rhythm, into different lengths of the same measure. The effect is animated and pleasing. We forget that it is only blank-verse we are reading, and fancy that we hear the music rhyme in our ears. As specimens of the style in which the old stories may be presented to modern readers, these are excellent. The attempt deserves as much praise for its modesty as for its merit.

Asphodel. (Boston: Ticknor & Fields. 1866.)—Asphodel is the story of a widower, named Russell, who came with his little girl to stay at his friend Herbert's house on the sea-shore with Mrs. Herbert, while Herbert himself was absent on a voyage for his health. There came at the same time a friend of Mrs. Herbert, named Erminia, to teach the children and keep their mother company. Russell was a great poet, sorrowed awfully for his wife, took long walks by moonlight, and fell in love with Erminia with extraordinary rapidity, but not more rapidly than Erminia fell in love with him. But he never told his love. He simply committed his little girl Fanny to Erminia's care with a good deal of blushing and sighing, while he went to California to look after some property. While in California he fell in love with another young lady named Amy, but, by the time he proposed to her, had sent a ring to Erminia. Getting deeper and deeper into the muddle, he so mismanaged matters that Erminia arrived in California, to have a talk with him, as he was about to be married to Amy, and made her appearance at the house just as the minister was pronouncing the benediction on the newly married pair. A good deal of fainting, kissing, and shrieking followed. Amy caught cold and died of consumption. Erminia went mad, and the amiable Russell went home and passed the remainder of his days in exchanging sentimental reflections with Herbert and his wife. The story is ridiculous wherever it is not stupid. The characters are neither men nor women, and whatever they are, are contemptible, and the language we suppose must be called English, but is so stilted as in places to be scarcely comprehensible. How publishers of Messrs. Ticknor & Fields's standing were found for the work it is difficult to understand.

A Child's History of the United States. Vol. III. Part 2. History of the Great Rebellion. By John Bonner. (Harper & Brothers,

New York.)—We have not met with the preceding volumes of this series, nor are we familiar with the author's "child's histories" of Greece and Rome. We are charmed, however, with the clearness of this condensed *résumé* of the late civil war, and bear testimony to the skill with which so gigantic a story has been reduced—without violating its proportions—to so small a scale, and brought within the comprehension of the home or primary school. It is better than any similar undertaking of which we can speak. Not that it is faultless. Men, for instance, may understand, but children hardly, the description of Morgan's and Mosby's raiders—"brutal, blood-thirsty, and utterly God-forsaken scoundrels" (p. 188). An inuendo like this, however just, had better have been omitted: "I wonder if this Colonel Allen [a child-murdering] rebel will ask President Johnson for a pardon, and if he will get it." And this slang expression is indefensible, if only because of its obscurity: "The Emperor (Napoleon) . . . having an elephant of the largest size on his hands . . . in the shape of Mexico." The illustrations of this history have been carefully elaborated, and add much to the value of the text. Mr. Bonner has, we believe, succeeded in arousing such virtuous indignation in the New York *Daily News* as to determine it to begin a veritable, unprejudiced narrative of the same events for the same class of readers. It is the highest compliment he should covet.

The Idle Word. Short religious essays upon the gift of speech and its employment in conversation. By Edward Meyrick Goulburn, D.D., Prebendary of St. Paul's, etc. (D. Appleton & Co., New York.)—Our author's definition of an idle word is rather damaging to the book which he has written. An idle word is "one which does not fulfil some one of the ends which words were designed to fulfil." To prove this proposition, which it would seem might be self-evident, we have in the first place two chapters on the connection of speech with reason, than which two chapters nothing could be more unsatisfactory; then a chapter on the Trinity, in which is broached this argument for that great mystery: God is love. If God is love, he must always have been love; but if God was always love, he must always have loved something, and there must always have been some person to love. That person was the Word. The solemnity of speech is deepened very much by this consideration. The two following chapters are an attempt to wring a meaning from the Decalogue which it does not contain. The dignity of speech is next enforced by reference to the fact that language is the instrument of prophecy and sacrifice. Again, when Jesus cured the dumb spirit, he sighed. Dr. Goulburn suggests that it was because he was imposing such a responsibility. In chapter third, the doctor rises almost into eloquence when he rebukes the "spurious charity" of his generation, and pleads for a return to the good old-fashioned bigotry of ten and twenty centuries ago. The art of conversation is disposed of in a few clumsy sentences. From this book there is nothing to be learned. It was a waste of printer's ink to publish it.

The Toilers of the Sea. A Novel. By Victor Hugo. (Harper & Bros., New York.)—One cannot find fault with the enterprise which has produced this translation almost simultaneously with the appearance of the original on these shores. But why are we not allowed to read the dedication and the exegetical preface? and why is not the useful *table des matières* replaced by the equally useful *table of contents?* As for the version itself, it answers every purpose of the ordinary reader, but too often loses the finer shades of meaning. Thus, in that dramatic chapter which describes Gilliatt's putting out to sea by night, the *sententia generalis* "qui fraude guette" is clumsily narrowed into "a smuggler is necessarily a man on the look-out;" while the "ils épiaient" which follows, and which evidently was meant to adduce an instance of the general truth aforesaid, is converted into a mere apposition—"it is part of his business to watch," In the same chapter the French idiom for "to be at home" is badly rendered. Other instances of an imperfect knowledge of the language, or of an inability to handle it, are not wanting; but we need not specify them. Even one who reads French generally with ease will have found certain parts of "Les Travailleurs" so tough as to make the translator's job-work a welcome substitute for the dictionary.

The Works of the Right Hon. Edmund Burke. Revised edition. Vol. V. (Little, Brown & Co., Boston.)—This volume contains: "Observations on the Conduct of the Minority, particularly in the last Session of Parliament, 1793;" "Preface to the Address of M. Brissot to his Constituents;" "Letter to William Elliott, Esq., 1795;" "Thoughts and Details on Scarcity;" "Letter to a Noble Lord on the Attacks made upon Mr. Burke and his Pension, 1796;" and "Three Letters to a Member of Parliament on the Proposals for Peace with the Regicide Directory of France." In the first mentioned writing, Burke charges the partizans of Fox with persistently asserting that the House of Commons is not the true representative of the people, and contending for "individual representation." Every reform since his day, however, has tended to enlarge the franchise; and it is only astonishing that men like the Rev. F. D. Maurice, who are in genuine sympathy with the laboring classes, and who can not only witness this tendency about them, but might gather some reasons from our American example for not fearing it, should still be found expressing very nearly the same solicitude as Burke, who knew democracy only through the French Revolution.

Geological Sketches. By L. Agassiz. (Ticknor & Fields, Boston.)—Mr. Agassiz's contributions to the "Atlantic Monthly" are here a second time collected in book form. They are, as the author describes them, familiar talks, not scientific papers, having all the charm of his lectures except his personal delivery. But if we miss the very countenance of the professor, we have a counterfeit on steel which leaves little to be desired; and if we cannot enjoy his skilful use of the black-board, we have numerous illustrations in fac-simile which answer every purpose. A third volume, on glaciers, in addition to the three chapters on the same subject included in the present, is promised at some future time. The series will possess a high value as a means of popular instruction.

The History of Henry Esmond, Esq. 2 vols.—*The Yellowplush Papers.* By William M. Thackeray. (Leypoldt & Holt, New York; Bernard Tauchnitz, Leipzig.)—That familiar edition of British authors for which British custom-houses have no ruth when they have pounced upon it, is here disguised in wine-colored boards, for the usual paper covers. The convenient shape, the still foreign-looking imprint, remain the same; and whoever wishes these classics and their mates in a form not so flimsy as to be easily worn out, nor so elegant as to preclude frequent usage, but at once durable in the hand and ornamental on the shelf, has here or never the golden mean.

SCIENTIFIC NOTES.

PISCICULTURE.—The States of Connecticut, Massachusetts, Vermont, and New Hampshire have a common interest in the fish which frequent, or ought to frequent, the Connecticut river. The Merrimack river should be a common fishing ground for Massachusetts and New Hampshire. The shad, alewife, and salmon are the valuable fish which used to be taken in great numbers in these rivers throughout their whole extent, but since the first decade of this century the salmon has disappeared from the Connecticut, and has gradually become extinct in the Merrimack, while the shad in both rivers have very seriously decreased. Several causes have combined to produce this unfortunate result. The chief cause has been the building of impassable dams on both rivers; subordinate causes have been the destruction of young fish by mill-wheels, the pollution of the rivers with the filth of paper-mills, tanneries, gas-works, coal-oil distilleries, chemical works, and dye and paint-works, and, for the shad on the Connecticut, the use of gill-nets at the mouth of the river, by means of which great numbers of the fish are caught on their way up the river to spawn. The States of New Hampshire and Vermont, for whom the arresting of the fish within the limits of Massachusetts and Connecticut is a pure loss without any compensating advantage, made official representations to the two latter States touching "the improvident destruction of shad in the Connecticut river." Thereupon Massachusetts appointed two commissioners to study and report upon the existing obstructions to the passage of fish up the Connecticut and Merrimack, and the possibility and expediency of re-stocking the rivers. Mr. Lyman's report, submitted to the Massachusetts Legislature in January of this year, and noted briefly by us at the time, is a most thorough, concise, instructive, and entertaining discussion of the many interesting points involved in this difficult subject.

The shad and the salmon are sea fish which go each year from the sea to fresh water to deposit their spawn, and the fact is pretty well established that the shad, like the salmon, returns always to the river in which it was hatched. The shad begin to pass up the Connecticut and Merrimack in April, spawn in May and the first half of June, and pass gradually down the rivers in the last half of June and during July. The young attain a length of three or four inches by the end of July, but they are then very delicate, so that many are destroyed in the mill-races on their passage down the rivers. The salmon come from the sea into the rivers at the same time of year as the shad, or a little later, but here the likeness between these two species stops, and their subsequent development and habits are entirely dissimilar. The shad prefer a quiet river, the salmon a pure and rapid stream; the young shad are hatched in June and return to the sea in the summer of the year in which they were hatched, but the salmon, though they enter the rivers with the shad, do not spawn till autumn, the young fish are not

hatched till late winter or early spring, and they then remain in the fresh brooks where they were born a whole year or sometimes even two years. In the spring or early summer at the end of their first or second year they go down to the sea, returning to the river again after about ninety days in the early autumn. Making but a short visit to their native brooks, they go back to the sea in two or three months, to return again to the river in the following spring. In the third spring after its birth the female is mature. The length of life of the shad is very doubtful. Good authorities incline to the belief that many shad die after spawning at the end of their first year. It appears, then, that free passage over or through all obstructions must be secured to shad, up stream in April and May, and down stream in summer, but that for salmon the passages must be open up and down stream both in spring and autumn. Salmon, however, will continue to breed, although entirely cut off from the sea; such "land-locked" salmon decrease in size, but live and flourish.

There are two modes in which salmon and shad can surmount dams. The first is by the "pass," a sloping trough up which the fish rush; the second is by the "stair," a series of steps, whereof each is a water-tank; the fish jump up from step to step, aided by the flowing sheet of water, which makes a series of little falls in its descent. The "pass" is cheaper and less likely to get out of order than the "stair," but the "stair" gives the fish chances to rest, and is, therefore, better suited to high dams and to fish of less activity than the salmon. The "pass" may be made zigzag in order to check the speed of the water and form a series of eddies, and the "stair" may be similarly modified by making the outer lip of each tank slope first to the right and then to the left, and so on, alternately. Whichever form of fish-way be adopted, a channel, deep enough and free from obstructions, must lead to its foot; and it is obvious that both the fish-way and the channel need a considerable and constant supply of water. It is possible that this water may be of more value for other purposes—for turning wheels, for example—hence an important part of the duty of the Massachusetts Fish Commissioners was to determine whether there was surplus water at Holyoke, Lawrence, and Lowell during the months when the fish-ways must be open. A fish-way should have a sheet of water eight feet wide and one foot deep. The result of their enquiry was that there would be enough water at Holyoke for the existing mills and the fish-ways, but that at Lowell either the mills or the fish-way would suffer from scarcity of water at least one day out of six. Moreover, there would be difficulty at Lowell in keeping a proper channel to the foot of the fish-way full of water, for it often happens there that no water runs over the dam, and that the bed of the river below the dam is consequently dry for some distance. In re-stocking the Merrimack with fish, therefore, a loss of mechanical power would be incurred which would affect the capitalist on the one hand and thousands of operatives on the other, to an amount for which the salmon and shad might not bring an equivalent.

With regard to the effect upon fish of the pollution of the rivers with the refuse of factories of all kinds, the commissioners make several interesting points. They prove that the shad were actually driven away from Lawrence by the filth emptied into the river by the great dye and print works there; yet when they collected samples of water from the river at various points, endeavoring to secure the maximum pollution in each case, and submitted these samples to chemical analysis, they found but a small proportion of soluble matters, and these matters were not poisonous, but only harmless salts of iron, lime, and ammonia. Chemical analysis, however, is no great help in such a case. It cannot detect the mysterious something in earth, air, or water which spreads an epidemic disease; it cannot find anything beyond the normal constituents in air in which our senses perceive a thousand odors; the greater part of flavors, strong enough to our palates, entirely elude the clumsy instruments and methods of analysis; it cannot tell good wine from bad or genuine brandy from artificial. Chemical analysis, then, is no guide in investigating the fine questions of animal likes and dislikes. The chemical research does, however, prove that the deleterious substances which are discharged into the rivers are precipitated or decomposed with surprising rapidity, and that the water soon regains its normal purity, so far as the eye or chemical analysis can judge. The dye-houses and print-works discharge arseniates, sulphuric acid, chloride of lime, soap, copper salts, and many other substances injurious to fish, but these substances mutually decompose and destroy each other, and in a few moments from the time of discharge into the river they become so diffused through the whole body of water as to defy detection by the ordinary processes of analysis. The commissioners speak of the shiftless practice of throwing into the rivers much refuse from factories which, if rightly used, would have a real value, such as the lime from paper-mills and the soap-suds from woollen mills. A fair stream is a mechanical power and a lavatory, but it should not be a common sewer. If the pollution of the rivers could be confined to the moderate amount resulting from the use of the water for washing purposes, the difficulty of re-stocking large rivers with fish would be very much diminished, if not entirely removed. The commissioners recommend the construction of plank screens in the rivers opposite each race-way which discharges dirty water, in order to prevent the foul water from flowing into the middle of the river and so corrupting the whole stream; they also think that to prevent effectually the poisoning of the rivers, paper-mills, tanneries, gas-works, coal-oil distilleries, chemical works, and dye and print works must be forbidden, under legal penalties, to cast their refuse into running streams.

But if fish-ways should be constructed to enable salmon and shad to surmount the dams on the Merrimack and Connecticut, and if, also, the pollution of the rivers should be prevented by legal enactments, would these measures suffice to ensure the re-stocking of these rivers with salmon and shad? To this question the commissioners answer, that in all probability they would not. The instinct of these fish is to return to their breeding-beds, not to go beyond them. Now there are no salmon in either river, and the breeding-beds of the shad are below the dams. There is, however, a simple remedy for this difficulty—live shad can be carried up above the dams and salmon could be bred at the headwaters of the two rivers. But again, the best fish-ways and the most extensive breeding of the young fry would avail little without strictly enforced laws to regulate the time and manner of fishing. There should be at least two days in the week when all fishing should be forbidden, weirs and gill-nets should be interdicted, and the length and depth of seines and the size of their meshes should be established by law. To enforce such laws fish wardens would be necessary.

Though the results of this investigation apply directly only to two New England rivers, yet it is clear that the principles developed will, in the near future, be applicable to all our water courses which are used for manufacturing purposes. The preservation of game—whether fish, flesh, or fowl—in democratic communities presents difficulties which seem well-nigh insuperable. In truth, the preservation of game is probably not for the greatest good of the greatest number, or, if it be, the greatest number do not see it. At all events, it is obviously impossible to obtain from four different States, having different interests in the matter, such legislation as the Massachusetts commissioners assert to be essential for the preservation of fish in the Merrimack and Connecticut. As large rivers are apt to be boundaries, or to extend beyond the limits of a single State, this difficulty will be likely to recur.

NOW READY,

THE CATHOLIC WORLD

FOR MAY.

CONTENTS:

I.—PROBLEMS OF THE AGE.
II.—GLASTONBURY ABBEY, PAST AND PRESENT—THE RISE OF THE BENEDICTINES.
III.—SAINTS OF THE DESERT.
IV.—CHRISTINE: A TROUBADOUR'S SONG.
V.—JENIFER'S PRAYER. Part II.
VI.—A PRETENDED DERVISH IN TURKESTAN.
VII.—MATER DIVINÆ GRATLÆ.
VIII.—PAMPHLETS ON THE EIRENICON.
IX.—CURIOSITIES OF ANIMAL LIFE.
X.—POOR AND RICH.
XI.—ALL-HALLOW EVE; Or, THE TEST OF FUTURITY.
XII.—REQUIEM ÆTERNAM.
XIII.—TINTED SKETCHES IN MADEIRA.
XIV.—THE CATHOLIC PUBLICATION SOCIETY.
XV.—NEW PUBLICATIONS.

☞ Single copies, 50 cents; $5 per year.

JUST PUBLISHED:

Dr. Newman's Answer to Dr. Pusey's Eirenicon. 75 cents.
Life and Sermons of the Rev. Father Baker. $2 50.
Works of the Most Rev. Archbishop Hughes, 2 vols. $6.
Notes on Doctrinal and Spiritual Subjects. By the late Father Faber. $2 50.
St. Peter, his Name and his Office. By Allies. $3 50.
Lacordaire's Letters to Young Men. Edited by Montalembert. $2 50.
St. Francis and the Franciscans. $2.
The Divinity of Christ. By Aug. Nicole. $2.
Management of Criminals. By Bishop Ullathorne. 50 cents.
The Apostleship of Prayer. $1 75
The Life of the Blessed John Berchmans, S. J. $1 25.

ALSO IN PRESS:

MAY CAROLS. By Aubrey de Vere. (Blue and Gold.) $1 25.

All the new CATHOLIC PUBLICATIONS, American and English, received as soon as issued.

LAWRENCE KEHOE, Publisher,

"THE CATHOLIC WORLD," 145 Nassau Street,

NEW YORK.

READY AND FOR SALE AT ALL THE BOOKSTORES,

CULTIVATION OF THE GRAPE.

BY W. C. STRONG.

—

A complete manual of Grape Culture for every part of the country, including all recent improvements in forcing, grafting, training, etc., with directions for preserving the natural fruit in its original freshness, out of season.

—

ELEGANTLY PRINTED ON TINTED PAPER.

PRICE $3.

THE

BOOK OF ROSES,

By FRANCIS PARKMAN.

—

Mr. Parkman's reputation is such that the simple announcement of a volume on his favorite pursuit will secure a host of purchasers. The volume contains all the recent experiments in Rose Culture in this country and Europe, and a List of Roses most approved by the best cultivators of the present day, including the new Roses of 1865.

ELEGANTLY PRINTED ON TONED PAPER.

PRICE $3.

In a Few Days,

AND UNIFORM WITH THE ABOVE,

GARDEN FLOWERS:

HOW TO CULTIVATE THEM.

A Treatise on the Culture of Hardy Ornamental Trees, Shrubs, Annuals, Herbaceous and Budding Plants.

BY EDWARD SPRAGUE RAND, JR.,

Author of "Flowers for the Parlor and Garden."

GARDEN VEGETABLES.

BY FEARING BURR, JR.,

Author of "The Field and Garden Vegetables of America."

J. E. TILTON & CO.,

Publishers, Boston.

Our Illustrated Catalogue sent by mail, free, on receipt of stamp to prepay return postage.

NEARLY READY.

ECCE HOMO;

A SURVEY OF THE LIFE AND WORK OF JESUS CHRIST.

"A theological book of more power and freshness and higher insight we have not read for many years."—*Spectator.*

"It is full of valuable and suggestive thought, great power of dealing with the practical side of moral questions, and an infinite and most unaffected sympathy with all that is noble and generous and self-devoted."—*Literary Churchman.*

"An essay thoroughly independent of all special ecclesiastical influence, and thoroughly imbued with the true historic spirit, which is yet entirely free from the irrational assumptions by which the method falsely called 'historic' has recently been marked."—*North British Review.*

We shall publish "Ecco Homo" April 20, in one handsome 16mo volume. Price $1. Early orders from the trade solicited.

ROBERTS BROTHERS,

143 Washington Street, Boston.

FINANCIAL REVIEW.

NATION OFFICE, Saturday Evening, April 21, 1866.

A FURTHER small improvement in trade was developed this week. Staple goods, leading articles of grocery, and some descriptions of produce are moving more briskly, though the sales of jobbers still fall below their anticipations, and prices show no material recovery. In the country, people are still unwilling to buy except from hand to mouth. But, of course, in a very short time stocks will run so low that new purchases to replenish will become necessary, whatever the price of gold may be.

Gold remains pretty steady between 126½ and 127¼. This evening it closed at 126¾. It has again become very scarce in consequence of the large accumulation in the Sub-Treasury and the heavy sales of the bears. As much as ¼ of 1 per cent. has been paid more than once this week for the use of gold for a single day. At this rate, the endurance of the bears will soon be exhausted. No man can afford to sell gold short if it costs him 1½ per cent. a week to keep it out. As soon as the bears buy to cover, the bulls, who are hoarding gold for the purpose of keeping it scarce, will sell, and the premium will decline. On the 1st proximo the Government will disburse the interest on 5-20 bonds, and the supply in market will probably be fully equal to the demand. There are operators in the market, however, who believe that gold will not decline materially this year. They argue that there has been no attempt to contract the currency as yet, and that there is no certain sign that there will be any contraction; that, on the contrary, the volume of paper money is actually increasing, by reason of the issues of the National Banks; that we are apparently no nearer specie payments than we were six months ago, and yet gold has declined within that period from 148 to 126; that so far as the temper of the people can be ascertained from the action of their representatives in Congress, there is a general unwillingness to contract the currency for the purpose of restoring specie payments; and that with $850,000,000 of paper money afloat, a premium of 25 to 28 per cent. on gold is not at all excessive. These views are held by leading men in the Gold Room, who for some time have found it highly profitable to hold gold and lend it out at ⅛ to ¼ per cent. a day. Without endorsing or assenting to the argument, we may add that the advance in 5-20 bonds abroad to 74 (per *Persia*), which many operators regarded as likely to cause a fall in gold on this side, was wholly due to purchases in the London market for American account. At present prices of gold and 5-20s here and abroad, there is a considerable profit on their importation from Europe, and though the quantity imported is not likely to be large enough to affect the price here, it will not do to count too surely on a fall in gold here on advices of a further advance in bonds in the London market. Exchange is rather firmer than it was. We quote bankers' sterling bills at 107¾. This rate is considerably below the point at which gold can be profitably shipped as a remittance. The future course of the exchange market mainly depends on the supply of cotton from the South and the wants of the importers. Exchange brokers say that the importers, relying upon the pledge given by Congress in December last, that measures would be taken to contract the currency, have generally deferred their remittances to the other side, and have used their bankers' credits to an unusually large extent. If this be so, these importers will naturally enter the market as buyers between this and 1st June, and if the Southern supply of cotton should fall off, as many expect, we may see exchange advance to 109 again. If, on the other hand, the importers have remitted at the low rates of exchange, as they claim to have done, or if cotton should continue to come in from the South in large quantity, the rate may decline in June even below present figures.

The Secretary of the Treasury has given notice that after May 1st the interest allowed on clearing-house certificates will be reduced to 4 per cent. On other temporary deposits the interest has not yet been reduced, but the reduction cannot long be delayed. Money has consequently fallen in value to 4 to 5 per cent. on call, and many look for a steady 4 per cent. market throughout the summer. This will depend on the action of the Treasury Department. If a loan be offered to fund the interest-bearing legal tender, many institutions which are now using them in the double capacity of investments and reserve will be forced to supply their place with plain legal tender, and for a time another "scramble for greenbacks" may ensue. So general is the conviction that both the compound legal tender and the 7.30 notes are going to be funded, that the former have risen to within ¼ per cent. of their face value, with accumulated interest, and the latter to a price which renders them relatively dearer than the 5-20s into which they are convertible! Nothing has transpired with regard to the nature of the expected new loan. Advocates of a 5 per cent. long loan, and of new 6 per cent. 5-20 bonds, are pressing their rival schemes upon public notice in the newspapers, but it is not yet known which side is favored by the Secretary. Possibly, by the time these lines are printed, some light may have been shed on the subject, unless, indeed, Mr. McCulloch should have determined to await the adjournment of Congress before acting.

The course of the stock, gold, exchange, and money markets has been as follows during the week:

	April 14.	April 21.	Advance.	Decline.
United States Sixes of 1881	104⅞	106	1⅛	....
5-20 Bonds, old	103¾	104⅞	1⅛	...
5-20 Bonds of 1865	103⅞	104⅞	1	....
10-40 Bonds	92	93⅜	1⅜	....
7.30 Notes, second series	100¾	101⅞	1⅛	....
New York Central	92½	93	⅜	....
Erie Railway	72½	73⅝	1	....
Hudson River	109 ex. d.	109	....	....
Reading Railroad	104¼	104	....	¼
Michigan Southern	80	82⅛	2⅛	....
Cleveland and Pittsburgh	79¾	81¼	1½	....
Chicago and North-western	26⅞	26⅞	....	....
" " " Preferred	55¼	57¾	2½	....
Chicago and Rock Island	119½	121½	2	....
P., Fort Wayne, and Chicago	91¾	97⅜	6¼	....
Canton	52⅜	52⅝	⅜	....
Cumberland	44¼	44½	⅜	....
Mariposa	13	11½	....	1½
American Gold	126¾	126¾	⅜	....
Bankers' Bills on London	107¾	107¾	⅛	....
Call Loans	5	5	....	....

The stock market has been generally inactive this week, with spasmodic movements in clique stocks. Fort Wayne has been taken in hand by a vigorous party of bulls, and the shorts have been compelled to cover at a heavy loss. The advance is 6 per cent. for the week and 10 per cent. within three weeks. Nothing in the condition of the road or the prospect of its earnings justifies the advance. But money is so easy, and, for the sake of making interest, bankers are willing to lend on so slender a margin, that nothing is easier than to buy a large block of this or that stock, and frighten the bears into covering their contracts. It is not unlikely that the next dividend on Fort Wayne may be a semi-annual one of 4 per cent., instead of a quarterly one of 2½. Northwest preferred and Michigan Southern are both higher on speculative purchases. The annual report of the latter company has made its appearance, and develops a floating debt of over half a million. In the face of this indebtedness, it seems to have been the intention of the directors—who are large holders of the common stock—to pay a dividend thereon out of moneys derived from the sale of bonds. The scheme was nipped in the bud. A number of holders of guaranteed stock, who refused to acquiesce in the compromise with the common stockholders,

applied for and obtained an injunction which will effectually prevent the declaration of a dividend at present. This places the directors in an embarrassing position, as they cannot sell their stock for fear of being ousted from the direction at the coming election. An active movement has taken place in Quicksilver, which at one time this week sold as high as 58. It closes to-night at 51. Various opinions are expressed with regard to the value of the property, but its old friends seem to be chary of dealing in it. The Bank of California has bought all the quicksilver in the hands of the company at a moderate price. Erie continues to flutter between 72 and 74, with fluctuations rapid enough to satisfy the most ardent gambler. The annual report, now overdue, is not forthcoming, and the bears argue that the delay means that the directors have nothing pleasant to say. The speculative director, so well known in Wall Street, is popularly supposed to be short of the stock. But if he be short, there are others in the Street, with perhaps as long purses as he, who are long of it, and it would be hard to say to which side victory is likely to incline. In the end, of course, the stock must sell at much lower prices.

A large and well distributed business was done this week in Governments. Old 5-20 bonds have sold as high as 105, and the 7.30 notes at 102. This would seem to indicate that neither the public nor the large dealers in Governments are afraid of large receipts of bonds from Europe. In the extreme abundance of money, and with the uncertainties of the future, capitalists can find no better way of disposing of their money than in the purchase of Governments, and they are thus being quietly absorbed.

FIRST CLASS FIRE INSURANCE
ON THE PARTICIPATION PLAN.
MARKET FIRE INSURANCE COMPANY
37 WALL STREET, CORNER OF JAUNCEY COURT.
CONDITION OF THE COMPANY.
ABSTRACT OF THE ANNUAL REPORT OF DEC. 31, 1864.

TOTAL ASSETS	$414,729 18
Viz.—Bonds and Mortgages	$134,672 00
Temporary Loans	92,630 00
Real Estate	10,000 00
100 Shares Mer. Ex. Bank	5,000 00
Government Sec., value	144,514 00
Cash on hand	18,042 34
Interest due	3,085 58
Premiums due	6,785 26
PRESENT LIABILITIES	$15,995
NET SURPLUS	198,733 26

This Company will continue, as heretofore, to insure respectable parties against
DISASTER BY FIRE
At fair and remunerating rates; extending, according to the terms on its Policies, the advantage of the
PARTICIPATION PLAN OF THE COMPANY,
pursued by it for several years past, with such great success and popularity, and profit to its customers: whereby
(75) SEVENTY-FIVE PER CENT. (75)
of the Profits, instead of being withdrawn from the Company in Dividends to Stockholders, is invested as a "SCRIP FUND," and held for greater protection of its Policyholders; and Scrip, bearing interest, is issued to Customers therefor; thus, IN THIS COMPANY, those who furnish the business, AND PAY THE PREMIUMS, derive the largest share of advantages; and when the accumulations of the SCRIP FUND shall exceed
FIVE HUNDRED THOUSAND DOLLARS,
the excess will be applied to PAY OFF the Scrip IN CASH in the order of its issue.
☞ The liberal and prompt adjustment of Claims for Loss, WHEN FAIR AND SQUARE, is a specialty with this Company.
NOTE.—This Company does not insure on the hazards of RIVER, LAKE, or INLAND NAVIGATION; confining itself strictly to a legitimate FIRE INSURANCE BUSINESS.
ASHER TAYLOR, President.
H. P. FREEMAN, Secretary.

NEW FEATURES—NEW TABLES,

By which all Policies are NON-FORFEITING and ENDOWMENT, payable at about the same cost as ordinary Life and Ten-Payment Policies payable at death only. We call special attention to these Tables as exceedingly attractive and ORIGINAL with the UNION. In case payments are discontinued, after two premiums have been paid, the Company contract to pay, AT DEATH or the SPECIFIED AGE, an amount in proportion to the number of premiums paid.

The Percentage system of Dividends used by this Company affords greater protection to the family than any other plan, as in event of an early death the amount of policy paid is twice that paid by all cash Companies with the same cash outlay of premiums.

The greatest possible liberality in assisting parties to keep their Policies in force.

Liberality and promptitude in the settlement of claims.

We refer to the Massachusetts and New York Insurance Commissioners' Reports for 1864 and 1865 as an evidence of the Safety, Reliability, and Unparalleled Success of the Union Mutual.

J. W. & H. JUDD, GENERAL AGENTS.

JAY COOKE & CO.,

BANKERS.

In connection with our houses in Philadelphia and Washington, we have this day opened an office at No. 1 Nassau Street, corner of Wall Street, in this city.

Mr. EDWARD DODGE, late of Clark, Dodge & Co., New York, Mr. H. C. FAHNESTOCK, of our Washington House, and Mr. PITT COOKE, of Sandusky, Ohio, will be resident partners.

We shall give particular attention to the PURCHASE, SALE, and EXCHANGE of GOVERNMENT SECURITIES of all issues: to orders for purchase and sale of STOCKS, BONDS, and GOLD, and to all business of National Banks.

JAY COOKE & CO.

MARCH 1, 1866.

The Nation:

A Journal of Politics, Literature, Science, and Art.

THIS journal will not be the organ of any party, sect, or body. It will, on the contrary, make an earnest effort to bring to the discussion of political and social questions a really critical spirit, and to wage war upon the vices of violence, exaggeration, and misrepresentation by which so much of the political writing of the day is marred.

The criticism of books and works of art will form one of its most prominent features: and pains will be taken to have this task performed in every case by writers possessing special qualifications for it.

It is intended, in the interest of investors, as well as of the public generally, to have questions of trade and finance treated every week by a writer whose position and character will give his articles an exceptional value, and render them a safe and trustworthy guide.

TERMS:—Six Dollars per annum, in advance; Six months, Four Dollars. When delivered by Carrier in New York or Brooklyn, Fifty Cents additional.

THE BEST SEWING-MACHINES IN THE WORLD.

THE WEED MACHINES,

With all their valuable improvements, entirely overcome all imperfections. They are superior to all others for family and manufacturing purposes, simple in construction, durable in all their parts, and readily understood. They have certainty of stitch on all kinds of fabrics, and are adapted to a wide range of work without change or adjustment, using all kinds of thread. Will hem, fell, bind, gather, braid, tuck, quilt, cord, and, in fact, do all kinds of work required by families or manufacturers. We invite all persons in search of an instrument to execute any kind of sewing now done by machinery to inspect them, and recommend all parties engaging in the sale of sewing-machines to make sure they secure the best by examining the WEED before purchasing. They make the shuttle-stitch, which cannot be excelled for firmness, elasticity, durability, and elegance of finish. They have received the highest premiums in every instance where they have been exhibited in competition with other standard machines. The company being duly licensed, the machines are protected against infringements or litigation.

Reliable agents wanted, to whom we offer great inducements. Every explanation will be cheerfully given to all, whether they wish to purchase or not. Descriptive circulars, together with specimens of their work, will be furnished to all who desire them by mail or otherwise.

Improvements in Piano-fortes.

One of the simplest and most truly valuable improvements yet made in the Piano-forte is that invented and patented by

DECKER BROTHERS, 91 BLEECKER STREET,

in this city. By correcting the only imperfections arising from the use of the full iron-plate, and that, too, by not detracting in the slightest degree from its many positive advantages, the Messrs. DECKER have developed in their instruments a tone at once admirable for its purity, fulness, prolongation, and sweetness, and the high estimation in which their improvement is held is well shown in the rapidly increasing business of their firm.—*Tribune.*

MARVIN'S

PATENT FIRE AND BURGLAR SAFF:

Superior to any others in the following particulars:
They are more fire-proof.
They are more burglar-proof.
They are perfectly dry.
They do not lose their fire-proof qualities by age.
Manufactured only by

MARVIN & CO., 265 Broadway.

721 Chestnut Street, Philadelphia.

PARLOR AND CHURCH ORGANS AND MELODEONS.

MESSRS. CARHART & NEEDHAM, established in 1846, are the oldest manufacturers of the improved Reed instruments in the United States, Mr Carhart being the inventor and patentee of all the essential improvements which have been made in these instruments up to the present date.

They have been established over twenty years, during which period they have manufactured a vast number of instruments of all classes; and wherever they have been exhibited in competition with the instruments of other makers, they have invariably taken the highest premium.

THE LAST TRIUMPH OF CARHART & NEEDHAM.

At the Fair of the American Institute held in New York in 1865 CARHART & NEEDHAM received the SPECIAL GOLD MEDAL over all the other instruments placed there in competition. The judges were Dr. Wm. Berge, C. B. Seymour (critic of the New York *Times*), Thomas Appleton, celebrated organ builder of Boston, George Jardine, also a well-known organ builder, and Dr. E. Ringer, an expert in the business.

EXTRACTS FROM THE SEVERAL REPORTS OF THE JUDGES.

From Report of Dr. Wm. Berge.

"The quality of the tone is the best I have ever heard, and the number of stops surpassed my expectations. The delicacy of *touch* and the quickness of *speech* are remarkable. In fine, I consider the Parlor Organ of Messrs. CARHART & NEEDHAM to be the best on exhibition, and therefore entitled to the highest award of the Institute."

From the Report of C. B. Seymour.

"The undersigned thinks it proper to suggest that CARHART & NEEDHAM should receive a Special First Premium for their large Parlor Organ."

From Report of Thomas Appleton.

"No. 526 is the best for the following reasons: 1st. It contains more reeds and of greater variety than any other. 2d, The reeds are placed above the key-board, thereby allowing a greater volume of sound to be heard. 3d, The successful application of the swell, which makes this instrument resemble the church organ more nearly than any previous arrangement. 4th, The voicing of the reeds is remarkable, and in the smoothness and quality of tone they resemble pipes more than reeds. The instrument is undoubtedly superior to any ever before constructed with reeds."

From Report of George Jardine.

"To the honor and credit of the United States of America a native American citizen is the first in the world who has discovered and demonstrated that not only can these vibrating tongues or reeds descend lower in the base, but of the very finest quality of tone, rich, round, and full, of quick articulation and free from *windiness*, right down to the 32 feet tone of C C C C. No doubt the fame of these gentlemen and their discovery will very soon and deservedly be circulated among the makers of Reed Organs in the world."

From Report of Dr. Ringer.

"No. 526 is the best for the following reasons: For its superior softness, evenness, and power of tone, being less reedy than in any instrument I have examined. 2d. For the great number of keys of different character of tone, which give the player an almost infinite variety of combinations."

THE GOLD MEDAL.

From Watson's Weekly *Art Journal.*

"AWARDS TO MUSICAL INSTRUMENTS.—A gold medal was awarded at the late Fair of the American Institute to CARHART & NEEDHAM for the best reed instrument on exhibition—a very just testimonial."

"They are an exceedingly good substitute for an organ, and I can speak of them in the highest terms."—GEO. W. MORGAN.

"I have found them to be the *finest instruments of the class I ever saw.*"—GEO. F. BRISTOW.

"They are entitled to be ranked as the *first* and *best* among instruments of their class."—WM. A. KING.

"*The tone is incomparable*, and they are *far in advance* of any other instrument of a similar kind."—CHARLES FRADEL.

CARHART & NEEDHAM

Second-hand Pianos at bargains, prices $60, $75, $100, $125, $150, $175, $200, and $225. Factory and Warerooms, 481 Broadway. Cash paid for second-hand Pianos.

STEINWAY & SONS'

GRAND, SQUARE, AND UPRIGHT PIANO-FORTES

Have taken Thirty-two First Premiums, Gold and Silver Medals, at the Principal Fairs held in this country within the last ten years, and in addition thereto they were awarded a First Prize Medal at the Great International Exhibition in London, 1862, in competition with 269 Pianos from all parts of the World.

That the great superiority of these instruments is now universally conceded is abundantly proven by the FACT that Messrs. Steinways' "scales, improvements, and peculiarities of construction" have been copied by the great majority of the manufacturers of both hemispheres (AS CLOSELY AS COULD BE DONE WITHOUT INFRINGEMENT OF PATENT RIGHTS) and that their instruments are used by the most eminent pianists of Europe and America, who prefer them for their own public and private use, whenever accessible.

STEINWAY & SONS direct special attention to their

PATENT AGRAFFE ARRANGEMENT,

which, having been practically tested in all their grand and highest-priced Square Pianos, and admitted to be one of the greatest improvements of modern times, will hereafter be introduced in EVERY PIANO MANUFACTURED BY THEM WITHOUT INCREASE OF COST to the purchaser, in order that ALL their patrons may reap its benefits.

STEINWAY & SONS' PIANOS are the only American instruments exported to Europe in large numbers, and used in European concert-rooms.

WAREROOMS, 71 & 73 EAST FOURTEENTH ST., between Union Square and Irving Place, New York.

Topics of the Day.

THE Reconstruction Committee have at last produced a "plan," and we confess we doubt very much whether they have strong hopes of its adoption. It consists of an amendment to the Constitution and two bills. Of the adoption of the former there does not seem much probability. The section which disfranchises for four years to come all who "have voluntarily adhered to the late insurrection or given it aid or comfort" could, in our opinion, never be enforced, even if adopted. Who would exclude so large a mass of the population from the polls throughout the length and breadth of the South, and what should we gain by their exclusion, supposing we could effect it? The bills are better, but are only bills. They most properly disqualify for office, for ever, all the high ex-officials of the Confederacy. There is not a word about the suffrage to be found anywhere, which, considering who the majority of the committee are, must be due to sheer want of confidence in the public. We fear there is now little hope of anything till the people have spoken at the fall elections.

THE report of the Judiciary Committee on the liberty taken by the Secretary of the Treasury and by the Postmaster-General in dispensing with the oath prescribed by act of Congress for office-holders in the Southern States, makes some strange and irritating revelations. There is no question that, in a large majority of cases, Union men at the South would serve the Government more faithfully than ex-rebels, and that the applications of the former for places for which they were no doubt as competent as anybody else have in a large number of cases been passed over. But the *Evening Post* in discussing the matter has, in our opinion, overlooked one or two very important considerations. Government offices are not, and ought not to be, bestowed as rewards for any kind of service on anybody whose fitness is not incontestable, and they ought not to be talked of as rewards. There is no more fertile source of corruption than the habit the public has got into of so regarding them; and though we cannot excuse the lawlessness of dispensing with the oath, we sincerely hope that in making appointments at the South regard will be had rather to the efficiency of the service the candidate is likely to render, than to anything he has either done or suffered in the past. The case of Mr. Gier, of which so much has been said, undoubtedly seems a hard one; but it ought not to be forgotten that the office of assessor of internal revenue is an inquisitorial, odious, and vexatious one in itself, and that it would be made more so if filled by a man who was, as Mr. Gier would probably be, obnoxious to the great body of his neighbors. It is sad, no doubt, that such a man should be obnoxious for such reasons, but in governing men we have to take them as we find them; and while we are in favor of enforcing justice at the South to the last hair's-breadth, we are not in favor of harassing or irritating the population for the mere purpose of supplying the handful of Union men with Government offices—things which most men are far better without.

PROVOST-MARSHAL-GENERAL FRY has just submitted to the Secretary of War a report of the operations of his Bureau. The preface of the report has found its way into print, and contains some valuble information. We learn from it that a full and exact enrolment of all men in the loyal States liable to military duty showed an aggregate number of 2,254,063, not including 1,000,516 soldiers actually under arms. The average cost of recruiting a man before the establishment of the Bureau was $34 01; afterwards the cost was reduced to $9 84. It appears that the Bureau has cost the Government nothing, but by its own operations in conformity to law has raised more than $26,000,000, out of which it has defrayed all its expenses, and has a balance of more than $9,000,000. The whole number of officers and enlisted men who were killed outright, or who died of wounds received in battle, was 96,089. Nearly double this number, 184,659, died of disease or accident, and the total loss in service was 280,739 men and officers. 76,526 men who had deserted were arrested by officers of the Bureau and returned to their place in the ranks. General Fry praises his district provost-marshals, surgeons, and other subordinates, and recommends that the system of recruiting which the Bureau established be permanently adopted.

THE cholera on the ships quarantined at this port, which has been of an extremely virulent type, is abating, having, it is hoped, nearly run its course among those on board. It does not yet appear on shore. The Health Commission has published a bulletin of advice substantially agreeing with the views presented in our article of last week. The Governor of the State has issued a "Proclamation of Peril," which confers very extraordinary powers upon the Board, including authority "to make such expenditures, incur such pecuniary obligations, and borrow such money" as it may deem to be needful. Rarely in free countries has any body of men been so completely trusted in a matter of such terrible importance to the citizens.

IN the last number of THE NATION we gave a synopsis of an able pamphlet which attempts to show that the power of removal from office without a cause is not a power which the Constitution vests in the President alone. We took occasion then to point out the important practical bearings of this question of rotation in office both upon public morality, which under its influence tends to become corrupted and debased, and upon the Government, which tends to grow too strong for popular freedom, while it grows inefficient for the public service. It would be a cause of satisfaction to learn that Congress intended to take this matter into consideration. Meantime we trust that the Philadelphia *Press* is not mistaken in saying that a certain Indiana postmaster, recently removed, means to keep his office till the Senate confirms his successor. Thus, very probably, the question may be brought into court and settled judicially. The President has now begun to slaughter his radical subordinates. There bids fair to be a war of giants between him and the Senate on the whole subject.

THE New York *Times* requests the particular attention of its readers to an article that recently made its appearance in a newspaper published at Auburn, the home of Secretary Seward. It is a survey of the political situation, and whoever may be its author it reaches some remarkable conclusions. How shall we get security that the late rebels will not rebel again? That, the article declares, is the vital question before Congress and the people. Can it be exacted from rebels as individuals? No; for some of them have been pardoned by the President, and many of them are paroled soldiers; and on the whole it is impossible by any

constitutional method to obtain guarantees for the good behavior of rebels as individuals. Consider them in their collective capacity, then, as States; can such guarantees be extorted? No. They are States in the Union; the Federal Government therefore has no way of obtaining any guarantees except by a constitutional amendment, and a constitutional amendment of that kind would not be ratified by three-fourths of the States. Direct means failing, is it possible to exact securities by any indirection? To obtain them in that way is as impossible as to obtain them in the other. There are some men, to be sure, who do think it possible. Some men would exclude the Southern States from representation until they so amended their constitutions as to declare the Union of States perpetual, and some men would go further—would exclude also the Southern vote for president and vice-president, and would resist by force the election of a president and vice-president by the united vote of the Southern people and the Northern Democratic party. But no such policy would make the future secure. Alexander H. Stephens "has said distinctly that the Southern people have complied with all the terms originally offered them, and all which Congress had the right to impose." It may reasonably be expected, then, that in 1868 the South will choose electors of president and vice-president, and if it should so happen that these electoral votes, together with those of the Northern Democrats, "are enough to elect a president and vice-president, and they are not allowed, there will be political trouble of a very formidable character," and with President Johnson in command of the military the candidates so elected could not be kept out of office.

General Canby, in Louisiana, and General Ruger, in North Carolina, have recently brought the military power of the Government into collision with the judicial authority. Gee, the Salisbury jailor, is on trial in Raleigh before a military commission, and a writ of habeas corpus taken out in his behalf was disregarded by General Ruger, who still holds his prisoner and will not himself submit to arrest for contempt. The contempt committed by General Canby lay in preventing the execution of a writ of sequestration obtained against five hundred bales of cotton by the U. S. Treasurer. He suffered himself to be arrested. No doubt in the end both of these cases will go before President Johnson and his cabinet. It is to be hoped that we shall then have some authoritative decision that will prevent these conflicts of authority, which, since the Peace proclamation, bid fair to become numerous, and which are so unprofitable and so exasperating to all concerned in them.

It is noted that the proportion of gold received at San Francisco which comes from individuals instead of joint-stock companies is quite rapidly increasing, which is considered an indication that the mines are being worked more in the way of a regular and well-ordered business and less merely speculatively than heretofore.

The pork disease is acknowledged to be common in the West. A thorough scientific and commercial report upon it has been published at Chicago. The views taken are similar to those published some time since in our Scientific Notes.

Head-Centre Stephens has stated in Paris that he is coming to America in order to bring back with him an army of 200,000 men, which he understands to be in readiness here. We presume his arrival will stimulate the subscriptions of money, which lately began to fall off, but the army must be concealed in some out-of-the-way place, as we believe even the police have not heard of it. Whenever it is discovered, it will be the duty of the United States Marshal to take it into custody.

The *Neues Fremdenblatt* contains what purports to be the particulars of an alliance defensive and offensive between Prussia and Italy, in view of the impending war between the former and Austria. The treaty is in all points so exactly what Italy most desires, that we cannot help doubting the whole story, and we doubt more particularly whether Napoleon will sit by and see any such arrangement carried out without having more to say in the matter than either of the "high contracting" parties will care to hear.

CONGRESS.

Washington, April 28, 1866.

There are unmistakable symptoms of a very acrimonious contest between the President and the Senate upon the question of the official patronage of the Government. The issue has been precipitated by many recent removals of postmasters, internal revenue collectors, etc., of the radical Republican order, to make way for officers of the conservative or Johnson school of opinion. The President, who is not thought to be spontaneously proscriptive, and has held back from making these removals much longer than was commonly expected, has at length been urged into it by a combination of personal and political influences, the main strength of which is found in the argument that he must sustain his policy by his official patronage, if he would see that policy succeed. These new appointments are not being confirmed by the Senate, which claims its full share in the appointing power, and refuses to sanction removals made for no other reason than hostility to the President's policy. Already the fruits of this controversy are manifest in a proposition in the Senate to attach to an appropriation bill a denial of salary to all such new appointees as the Senate does not confirm. But this is a game which both sides can play at, and when once the work begins of loading down the appropriation bills with the points of political difference between the Executive and Congress, it can only end in embarrassing the wheels of Government, without settling the matters in controversy.

DIARY.

Monday, April 23, 1866.—In the Senate, Mr. Wade introduced a bill to repeal the act of 1846 retroceding Alexandria, in the District of Columbia, to Virginia. A bill granting bonds to the State of Nevada for educational purposes was passed. Also a bill to regulate the pay department of the navy. The post-office appropriation bill was considered. Mr. Henderson moved an amendment, providing that postmasters and other civil officers appointed by the President without the consent of the Senate shall draw no salary. A long debate ensued on the appointing power of the President.

In the House, the Committee on the District of Columbia was instructed to enquire and report as to the expediency of establishing the eight hour system by act of Congress in the District. Mr. Wilson, from the Judiciary Committee, made an adverse report on the President's message, recommending a modification of the test oath of July 2, 1862. A joint resolution, authorizing the President to enforce such orders of quarantine to prevent the spread of the cholera in the United States as he may deem proper, was passed. The bill to re organize the army of the United States was discussed and amended.

April 24.—In the Senate, the motion to reconsider the vote by which the Senate rejected the bill admitting Colorado to the Union was discussed at length by Messrs. Sumner and Guthrie against the motion to reconsider, and by Messrs. Stewart and Nye in its favor.

In the House, the bill for the construction of a ship canal around Niagara Falls was discussed by Mr. Hulburd in its favor and Mr. J. M. Humphrey against it. The army bill was again debated at length. An amendment providing for the discontinuance of the Provost-Marshal-General's Bureau was adopted. The bill granting lands to the Iowa and Missouri State Line Railroad Co., also the bill to secure the speedy construction of the Northern Pacific Railroad, were debated.

April 25.—In the Senate, the motion to reconsider the vote rejecting the admission of Colorado was debated by Messrs. Lane, Williams, Howard, and Cresswell in its favor, and by Messrs. Doolittle, Hendricks, Edmunds, and Johnson against it. The motion to reconsider was carried—yeas, 19; nays, 13. The bill being before the Senate, Mr. Sumner offered an amendment, prohibiting any denial of the elective franchise in Colorado on account of color or race. Rejected—yeas, 7; nays, 27. The bill to admit Colorado as a State to the Union was then passed—yeas, 19; nays, 13.

In the House, a bill imposing a duty on live animals imported was passed. Mr. Morrill, from the Committee on Ways and Means, reported a bill to amend the internal revenue acts. Made a special order for May 3. The bill to secure the completion of the Northern Pacific Railroad was again debated at length.

April 26.—In the Senate, House bill to authorize all railroads to carry freight and passengers between the States on equal terms, was opposed by Messrs. Morrill, McDougall, and Johnson. A bill was passed, appropriating $4,200,000 per annum to defray expenses of the collection of customs. A petition from citizens of New York for the expulsion of Senator Davis, of Kentucky, he having declared himself an enemy of the Government, was referred.

In the House, a bill extending the jurisdiction of the court of claims was passed. Bills were passed to remit certain duties, to facilitate the settlement of the accounts of the United States Treasurer, and for the relief of paymasters of the army. The Northern Pacific Railroad bill was discussed at length.

April 27.—In the Senate, the bill for the relief of sundry naval contractors was amended so as to pay them twelve per cent. additional on their contracts, and passed—yeas, 22; nays, 11. Mr. Wilson opposed a constitutional amendment, prohibiting payment for slaves or for rebel war debts; basing representation on number of inhabitants, after deducting those excluded from suffrage; and admitting such States lately in rebellion as adopt this amendment to representation in Congress without delay. Adjourned to April 30.

In the House, a resolution was passed calling on the President for a collation of the laws and constitutional provisions as to freedmen of the States late in rebellion. The bill to secure the speedy completion of the Northern Pacific Railroad was again

discussed, and on motion of Mr. Spalding the bill was laid on the table—yeas, 76; nays, 56.

April 28.—The Senate was not in session. In the House, speeches on the state of the Union were made by Messrs. Scofield, Higby, Harding, of Kentucky, and Finck. Adjourned to April 30.

THE FREEDMEN.

THE assistant-commissioner for Florida reports that the demand for labor is so great that planters are compelled to pay good wages and treat their hands well in order to get and keep them upon their plantations, and that the unsalaried agents (civilians) are performing their duties in a satisfactory manner. At Fernandina the ex-rebel Finnegan is trying hard to oust Miss Merrick and her orphan asylum from what was formerly his residence. The National Freedmen's Relief Association assert that the property is theirs by purchase at a tax sale, and that the Treasury Department has confirmed their title by declaring this sale a valid one. The claimants maintain that the sale was invalid. Along the Suwanee River, the agent for Madison County says he found a number of freedmen cultivating the land for themselves, doing, besides, an occasional day's work at lumbering, which he considered the nearest approach to the free labor system of the North of anything he had seen in that State.

General Baird reports from Louisiana that many of the planters refuse to enter into contracts under the auspices of the Bureau. Amongst the obstacles to the success of the Bureau in this State are the so-called "Labor Laws" recently passed by the Legislature, and which the governor declared he would not approve. If these laws are enforced, it will leave the colored people in a state to which slavery itself would almost be preferable. They confine the negroes to the plantation where they are employed; do not permit another planter to offer them better wages; give them ten days to find a new home after the expiration of his contract. "Should he be unable, during that brief period, to find an employer willing to give him fair terms, or be caught *in transitu* to his place of employment, he becomes a vagrant and is put by the State authorities at compulsory labor for a year." The laws also permit the employer to disarm the employee. The excessive demand for labor is a natural corrective of this legislation. There are in the State 114 schools, 233 teachers, 13,000 pupils (colored). The issue of rations to both white and black for the month of January amounted to 932 freedmen, 24 refugees, and 89 teachers and employees in the schools.

There is great destitution amongst the poor whites in Arkansas, and the assistant-commissioner says that, without aid, between 30,000 and 40,000 must have perished of starvation during the past season. During the quarter ending March 31, 234,063 rations were issued to whites and 32,955 to freedmen. Negro testimony is not allowed in the courts against white men, and Gen. Sprague declares that "if the military and Freedmen's Bureau are withdrawn, there is no place in this State where schools for colored children could or would be sustained."

The number of destitute freedmen in North Carolina has been greatly reduced, and the work of reduction is still going on. There is a great demand for labor. In the vicinity of Newbern the small-pox has been prevalent, but is now abating.

Col. Thomas reports from Mississippi that in some localities where the Bureau has been withdrawn the citizens have petitioned for its return, and state that they are willing to pay the salaries of the officers. Freed people manifest a disposition to leave those parts of the State where the troops and Bureau agents have been withdrawn. The school report shows 5,877 scholars and 88 teachers.

—Captain Merrell reports to Gen. Fisk that numerous outrages have been perpetrated on the freedmen in Eastern Kentucky, particularly in Marion, Barren, and Logan Counties. The freedmen are in the main well employed at fair wages, and suffer chiefly from the terrorism of lawless bands of "regulators" and "nigger-killers." There are 33 schools for colored children in the State, which are all sustained by subscriptions from the freed-people and taught by colored teachers.

—At Murfreesboro,' Tenn., on the 17th, a case involving two colored men, one of whom had inflicted fatal injuries on the other by returning a stone thrown at him, was committed to a jury of twelve colored men, with the consent of the Bureau. The prisoner was acquitted, as he had already been by the civil court, from which an appeal had been taken.

Notes.

LITERARY.

THE superstition that men have been transformed into animals is an element in every mythology with which we are acquainted, haunting the minds of those worshippers of the beautiful, the Greeks, the monstrous imaginations of the philosophic Hindus, and the grim, dark spirits of the north of Europe, whose religion was as primitive as the nature of which it was the type. Herodotus maintains that the Neurians were every year changed into wolves for several days, after which they put on again the appearance of men, a belief also mentioned by Pomponius Mela and by Petronius, the latter of whom relates a story of a soldier who, in the presence of a comrade, stripped himself and was suddenly a wolf, setting off with a howl for the woods, while the clothes which he had thrown off on the ground were turned into stone. The most common of these supposed transformations, the one which spread the widest, was that of men into wolves—a strange and terrible superstition which colored much of the old Norse literature, whence it descended like a turbid stream into the literatures of feudal Europe, growing darker as it gathered force. It was not confined to the lower orders—peasants, serfs, and the like; but spread among persons of rank—knights, lords, even ladies, the last being the most cruel of all. Of one of these ogresses we have an account in a volume recently published by Mr. Baring-Gould, entitled "The Book of Were-Wolves"—a Hungarian lady named Elizabeth; she was as fond of her personal appearance as some of her more civilized sisters of to-day, spending half the day at her toilet. On one occasion her maid saw something amiss in her head-dress and told her of it, for which she got such a box on the ears that the blood gushed from her nose and spirted in her mistress's face. When it was washed off the lady's face appeared more beautiful than before, the spots where the blood had spirted being much whiter than the rest of the skin. It was an insane fancy, of course, but the mad woman, for such she must have been, resolved in future to bathe her face and her whole body in blood—a devilish plan which she carried out by the help of three accomplices, a pair of old women and a monster named Fitzko, who killed her victims while the women caught their blood, in which she used to bathe at four in the morning. She is said to have caused the death of six hundred and fifty girls, who were entrapped into her castle under the pretence of being taken into service, but once there they were locked up in a cellar where they were tortured, often by Elizabeth herself, who had a fancy for having them beaten and then cut up with razors. By way of variety, they were occasionally burnt and then cut up; mostly, however, they were beaten to death. She grew so cruel at last that she would stick needles into those who rode with her in her coach, and when she was ill she bit a person who came near her bed. Her castle was finally seized, her accomplices executed, and she herself imprisoned for life. Not less diabolical than this she-wolf was Gilles de Laval, Maréchal de Retz, whose story has been narrated by Michelet and Lacroix. Left immensely rich by the death of his maternal grandfather, in 1432, he quitted the service of Charles the Seventh, and, surrounding himself with flatterers, servants, and men-at-arms, gave himself up to pleasures and crimes of the darkest dye. His principal abode was the Castle of Machecoul, a gloomy fortress, into which his servants were always enticing children, who were never after seen alive. In this fortress he had a secret chamber, in which his confidential attendants used to murder his innocent captives by slow and excruciating methods; sometimes he would cut and slice them himself. To lie where their blood would spirt upon him was his greatest delight. When they were dead he appeared to be filled with grief for what he had done, and would toss on his bed, weeping and praying, or would recite on his knees fervent prayers and litanies, while his servants washed the floor and burned the bodies in his great fireplace. Arrested in 1440, he confessed his crimes, and laid the desire which led him to commit them to an old Latin book, "Suetonius," he believed, which he found in his grandfather's library, and which was filled with accounts of the cruelties of the Roman emperors, the history of Tiberius, Caracalla, and the rest of that bloody band of imperial madmen. He confessed to committing about one hundred and twenty murders in a single year. He was hung at length, and, according to the usual custom, made a pious oration on the gallows.

—The interesting but unsatisfactory subject of mysticism, narrowed down to its development in France towards the close of the last century, has lately found a historian there in M. Franck, who chiefly concerns himself with its most prominent prophet, Saint-Martin, and, incidentally, with Saint-Martin's earliest teacher, Martinez de Pasqualis, a sort of Jewish cab

alist, and with old Jacob Böhme, the German mystic to whose singular vagaries in theology and philosophy Saint-Martin largely devoted himself. Of the former, Pasqualis, M. Franck tells us much that is new, mostly in reference to his mystical writings, which are contained in two manuscript volumes, the opening portion of which M. Franck publishes. It is an attempt to explain that *vexata quæstio*, the origin of evil, which is assigned to the free will of the evil-doers, the earliest of whom, emanating from the bosom of the Deity, were of a higher rank, spiritually speaking, than any beings of the same order of whom we have knowledge through the sacred Hebrew writings, and who fell through a determination to carry out their own plans instead of their Creator's. Their evil intent was arrested *in esse*, and the universe, which till then was not, became their prison. They were succeeded by the cherubim, seraphim, archangels, and angels, and lastly by man, who, under the name of the "Man-god," was made lord of the universe. Him they persuaded to become a creator in his turn, which he succeeded in doing so far as to clothe himself with a material form and to bring evil into the world, and in its train "death and all our woe." There is nothing very remarkable in all this, though, we fancy, a little originality on the part of Pasqualis. Concerning Böhme and his system, if he can be said to have had one, M. Franck does not give us any very clear idea, at any rate not so clear a one as may be found in the first volume of Dr. Erdmann's "History of Philosophy," lately published at Berlin. He is much more at home with Saint-Martin himself, who was remarkable as a thinker, if only from the fact of his standing in antagonism to all the prevailing doctrines of his time. All around him were materialists or sensationists; he retired within himself and found there not only the divinity which he sought, but the basis of all human knowledge, which he believed lay in self-consciousness. He combated the notion of Rousseau, in his "Social Contract," that man is naturally good and created for happiness, maintaining that the proposition was not applicable to man in his fallen condition, which was the only one that social theories could have anything to do with. The sovereignty of the people was Rousseau's cure for all the evils resulting from the breaking of the social contract; this Saint-Martin could not endure, though he hated all sorts of aristocracy, looking upon the Reign of Terror which swept them away for the time as a manifestation of divine justice. He lived through its stormy days in Paris, and died at the country-house of a friend in 1803, leaving but a shadowy memory in the title which he bestowed upon himself —*le philosophe inconnu*.

—The Society of Antiquarians has lost one of its most intelligent and valuable members, Mr. F. W. Fairholt, who died lately at the age of forty-eight. Of foreign descent, his parents being German, he was born in London, which was always the city of his heart, claiming his warmest love and his most careful study. Designed by his father for a tradesman, he preferred art instead, and from a teacher of drawing and a scene-painter became an illustrator of books, beginning with the "Pictorial Bible," "The History of England," and the "Pictorial Shakespeare." His *forte*, however, was antiquities, the spirit of which he caught readily, and faithfully reproduced; he was much in demand for his drawings of old coins, a walk of his profession in which he was probably without an equal in his time. As an author he was more favorably than widely known, writing as he did on special themes rather than on subjects of general interest. He wrote "A History of Old Civic Pageants" for the Percy Society, "A History of Costume in England," "The Dictionary of Terms in Art," "Gog and Magog," and a curious little volume on the history of tobacco and smoking, most of which works were illustrated from his own drawings.

—A meeting was recently held in the hall of the Sorbonne, at Paris, to consider the propriety of a new and more exact translation of the Scriptures into French, a project which originated with M. Petavel, pastor of the Swiss Church, London. The president was M. Amedée Thierry, senator and member of the Institute, and on the platform were Roman Catholics, Protestants, and Jews, who mingled together harmoniously, as they should have done on such an occasion. How well, indeed, the different and generally discordant elements blended, may be gathered from the names of the committee charged with the superintendence of the proposed translation, which consists of M. de Norlieu, parish priest of St. Louis d'Antin, M. Valette, pastor of the Confession of Augsburg, M. Paulin, of the Institute, M. Astruc, chief rabbi in France, and M. Petavel, who acts as secretary.

—An odd literary trial was recently brought in England, the plaintiff being one Strous with several initials, the writer of a novel entitled "The Old Ledger," and the defendants the owners and editors of the *Athenæum*, who some months since criticised the work in question, pronouncing it "the very worst attempt at a novel that has ever been perpetrated." Strous employed a Bow Street lawyer, who threw up the case when the attorney for the defendants succeeded in reading extracts from "The Old Ledger," a juror withdrawing for the purpose. The *Athenæum* is, of course, jubilant, though in a quiet and mysterious way.

SCIENTIFIC.

Torpidity of Animals.—They who are accustomed to witness merely the state of torpor into which many animals, both warm and cold-blooded, enter during the winter months of our northern latitudes, are hardly prepared for the fact that within the tropics a large number of other animals fall into an analogous condition through the heat and drought. We have the authority of Humboldt, supported by many observers, for the fact that in Venezuela and in the region of the Orinoco, "both land and water turtles, the colossal boas, and many of the smaller species of serpents, lie torpid and motionless in the hardened ground throughout the hot and dry season." The Indians often seek them in their retreats, as articles of food, and Humboldt mentions that, on one occasion, a party in camp were astonished by a crocodile's breaking up his summer quarters in the enclosure where they were sleeping, and where the reptile had lain buried since the disappearance of the waters. We have ourselves seen the workmen in Guiana, while digging trenches in a garden for planting vegetables, throw out several specimens of a species of eel (*Synbranchus*), which had buried themselves, as is their habit, when the dry season approached, and which, after an imprisonment of two or three months, would have found their way out again with the return of the rainy season.

The "mud fish" (*Lepidosiren*) of the Gambia is one of the most remarkable animals which pass into a "summer sleep." Their habits in this respect have been long known, and Prof. Owen has described the peculiar structure of their respiratory organs, which enables them, though fishes, to breathe air, when water is no longer accessible, during the period of their confinement. M. Auguste Dumeril has recently communicated to the Academy of Sciences some interesting observations made by himself on some of these animals at the Jardin des Plantes. Balls of perfectly dry clay containing "mud fishes" were placed in a tank and water slowly added, so as in some degree to imitate the gradual moistening of the earth by the rain. In due time three of the fishes broke open their coverings and escaped. That they were not, even in the dried clay, wholly torpid, is shown by the fact that in one case in which the ball was fractured, if the lining membrane were touched, the fish uttered a cry. After they came out they were fed with worms, were well nourished, and grew. M. Dumeril has had the good fortune to witness, for the first time in Europe, the process of going into "summer quarters." The two survivors began to show signs of preparation for their long sleep by secreting from the general surface of their bodies a large quantity of thick and viscid mucus, and soon after by burying themselves in the soft mud at the bottom of the tank. The water was then drawn off to the level of the mud and this allowed slowly to dry. In the course of time the mud became hard and cracked and the moisture disappeared, leaving them in their dry case of earth.

After about seventy days they were exhumed alive, each surrounded by a sort of cocoon formed of the hardened mucus secreted by their skin, and serving as a protection against the too great evaporation of moisture from the surface of their bodies. As they entered the mud they left behind them a tubular trail of mucus, which formed a communication between the sack enclosing the fish and the outer air. During the greater portion of the period of their retirement no water can reach their gills; their swim-bladders, however, receive blood diverted by a special arrangement from the gills and thus act like true lungs, which they in fact are. Thus we have a fish which is a water-breather at one period of the year, and an air-breather at another. In this last respect they make a close approach to the class of reptiles with which they have sometimes, though on insufficient grounds, been identified.

Aluminum Plates for Artificial Teeth.—The plates to which artificial teeth are attached are now made of gold for costly sets and of vulcanized rubber, colored with red sulphide of mercury, for cheap sets. The weight of gold is a serious objection to it, and yet the alternative of the lighter rubber is open to two objections, either one of which is serious. The rubber plates are thick, take up room in the mouth, and feel hot; and, secondly, the red coloring matter is too closely akin to the poisons of which mercury is the base. Plates made of any metallic alloy in which gold is not the chief ingredient are entirely inadmissible. A pure metal is very desirable for this use, and aluminum seems to be very suitable in many respects. It is strong enough, is not discolored by sulphuretted hydrogen, nor acted upon by any acids likely to be found in the mouth; the metal itself and its compounds are perfectly harmless, and cannot become poisonous by

any transformations; it is eight times lighter than gold, being only two and a half times heavier than water; lastly, it has no taste, and keeps very clean in the mouth. The price of aluminum should be, according to Deville, about the same as that of silver, weight for weight, or one-fourth that of silver, bulk for bulk. The labor required in working aluminum is, however, much greater than is generally bestowed on rubber work, and the use of the metal in dentistry has been patented in this country, so that aluminum plates are not likely to be very cheap. There is no good solder for aluminum, so that all joints in plates are made with rubber, previously filled with powdered aluminum, which imparts to the rubber a metallic lustre and general approximate resemblance to the metal itself.

MR. SWINBURNE'S FIRST-FRUITS.*

MR. SWINBURNE has done himself a great injustice in allowing his publishers to issue this volume without any intimation to its readers that the dramas contained in it were first published several years since. It would have been better for his reputation to leave them in obscurity than to bring them into the light of his recent success, which can have no other effect than to make their defects conspicuous. There is an immodesty in the proceeding which might be pardoned had the public been originally mistaken in neglecting these youthful performances, but which is with difficulty excused by the impatient reader who opens the book with the anticipations naturally excited by the merits of "Atalanta in Calydon." Mr. Swinburne rates his genius far too highly if he supposes that he has, even in his latest drama, given proof of faculties so extraordinary as to make the development of his intellectual powers a matter of interest to the critic, or to rouse curiosity concerning the crude productions of his callow years.

It is a pity to see a promising lad mistaking notoriety for fame, goaded by the sting of self-conceit instead of the spur of noble ambition, and yielding to the seductive temptations of publicity. The young poet requires, above all men, to prize the reserve which is the source of strength, and to cultivate that self-restraint and self-command without which genius runs to waste. Unless he be so possessed by the love of the ideal as to be his own severest critic, and to feel the insufficiency of his own best efforts, he is little likely to win lasting renown. Mr. Swinburne has not yet been taken up among the fixed stars of the poetic heaven. Perhaps he is only the rocket of this year, rising with a fine rush toward the sky, a moment's blazing wonder, to disappear in the darkness by which so many transient luminaries have been swallowed up.

The characteristic impossibility which marks Mr. Swinburne's later works is still more obvious in "The Queen Mother" and in "Rosamond." They remind us of the works of other men, not in the way of direct imitation, but by subtle resemblances of which the author is undoubtedly unconscious. His nature is so impressible as to receive easily the stamp of another's genius. Whatever is imitable in other men—be it Shakespeare, Browning, or the Trouveres—Mr. Swinburne gives us. But it is the inimitable alone that is precious. Chameleon-like he takes on the color of that upon which he feeds.

Now this is an intellectual condition common to all susceptible youths, nor is it at all incompatible with genuine originality. The only question is as to the proportions of the two. If we may judge by the distance between these early works and the "Atalanta," Mr. Swinburne is gradually gaining more and more power of expressing his own thoughts in his own way, and the comparison between his first and his last productions encourages the belief that he may yet achieve some work really his own, and only the better for his study of those works which still to some degree overmaster the free and full expression of his native genius.

It is hardly worth while, it would be hardly fair to the young poet's later promise, to analyze the plots or discuss the characters of the two plays in this volume. There is little dramatic interest in either. These tragedies, like most youthful attempts of the same sort, indicate that the writer had little sense of the nature of a tragedy as one of the highest forms of literary art, but regarded its form as quite subordinate to the expression of feeling and passion. In the absence of just critical discrimination there is no more common error than to suppose that principles of art are not laws but rules. It is on this error that the whole spasmodic school of tragedy is founded, and occasionally there is a spasm in Mr. Swinburne's plays.

It is a consequence of this, as well as of the susceptibility of the author to literary impressions, that there is but little nature in these plays. The characters and circumstances do not display the imaginative idealization so much as a sort of conventional representation of nature. One feels all the time not only that he is reading a play, but that the actors are puppets; that the author did not see his characters move, did not hear them speak, but was continually engaged in making them move and in speaking for them, and even then he does not make them say much that is worth listening to, especially as their diction is often exceedingly obscure.

But we will find no more fault with a book which will be forgotten if its author does nothing better than he has yet done, and which, if he wins a name among the poets, will be remembered only as showing the first uncertain traces of genius, and as marking the length of his flight from his starting place.

* "The Queen Mother, and Rosamond. By Algernon Charles Swinburne, author of 'Atalanta in Calydon' and 'Chastelard.'" Boston: Ticknor & Fields. 1866. 16mo, pp. 222.

J. J. PIATT'S POEMS.*

THIS thin volume seems to be remarkable not so much for the merit of anything it contains as that what it contains should ever be a volume at all. In the corners of small newspapers we expect to find plenty of verses without any perceptible quantity of poetical feeling or unborrowed thought, and not without a certain degree of smoothness. The country paper, we know, will have its poet's corner; and to have filled it now and again is hardly blamable in any young woman or young man. "The hole, not the mouse, is the thief," we say, quoting the charitable adage of the rabbins; "opportunity tempts." But the appearance of a bookful of such verses—it is really to be wished that this were a thing wholly unexpected. Charitable as we may desire to be, we feel that to the making of a book there goes a certain amount of premeditation, and we resent it. As single spies we can let such sorrows go by, but not when they advance upon us in battalia.

For the production of poetry like this the necessary qualifications are only too common. First of all, the writer should resemble the mass of his kind in having no proper sense of the shortness of life and of the value of his own and other people's time. Next, like a majority of his fellow citizens in this favored land of universal education, he should have read, and more or less judiciously admired, two or three popular poets. He should be possessed of some imitative ability, and he ought to be able several times out of every ten to find a good rhyme for a word already written. Ill health is not an essential prerequisite, though at first thought it might seem to be. Many most introspective, most melancholy poets are very like a certain head of a family in Independent Tartary. (We also can go far for similitudes.) He was a stout and a cheerful man, though an impudent thief and despoiler of other men's goods. Some customary mourning being required of him, he would once in a while, we are told, lay down his pipe, roll his eyeballs inward, apply himself to the most lugubrious lamentations, and then tranquilly resume his smoking. Quite often it happens that very robust people of the sanguine-nervous temperament and with a reasonable income can be sad as sadness itself on paper. And as for the reason why they should be so, it is the fashion of the day, and the fashion of the day is the poetaster's inspiration.

There must be at this moment two hundred thousand and odd persons in the British Islands alone actively engaged in versification. Some weeks ago there were two hundred thousand exactly, Professor Masson said, and we believe him; and we believe also that as time rolls on and the world advances further toward the general doom, the ominous number of such persons grows greater rather than diminishes. In the United States, even if we include the reconstructed home of Simms, there is considerably less of such so-called poetry than in England, but still there are far more producers of the forced fruits in question than that any one of them should ever really apprehend a failure of the regular supply, and so should take his own and preserve them—hermetically seal them, as we may say—in a book for future use. As we have seen, they are of no value for exportation, and the home public will not consume them—indeed, almost every family raises its own—for they are always to be had in their first greenness.

A man who has written a sonnet reads it with a prepossession in its favor. It must be that with a transcriber the case is different. At any rate, we found ourselves unable to like this one after copying it for quotation. It seemed to us to possess no beauty but the cheap beauty of smoothness. "Twofold" is the word printed over it:

> "If you should vanish in some lonely place,
> And never, never more appear again
> (Though your lost face should float about my brain,
> The elusive phantom of a lost embrace,
> Out of the mystery of a starless space),
> And I should strive with long conceptive pain
> Your form so dear from marble to regain,
> Or paint the flying memory of your face:
> I have not seen you, love, as others deem—
> Though stone or color might sheer semblance give,

* "Poems in Sunshine and Firelight. By John James Piatt." R. W. Carroll & Co., Cincinnati. 1866. Pp. 127.

I'd watch a child steal shyly from your heart,
To comfort little birds that orphans seem,
Or flowers that need a drop of dew to live,
And this, I think, would baffle human art."

The hesitating "I think," in the last line, seems to us hardly necessary. We speak, however, in some doubt as to the precise meaning of the sonnet. Turning the pages we come upon the poet in a lighter mood. He takes Pegasus to market, being, unless our memory is at fault, not the first poet dragged along by that headstrong allegory. The bystanders jeer at both horse and rider:

"'I have a dray-horse just his mate!'
'Here, smith, is something for your doing;'
'What hoofs!—he needs a deal of shoeing!'
And one, a punner, passing late,
'This was the winged horse I vow:
That he 's gone up—you see it now!'
Spoke with a self-perceiving smile.
'Speaking of wings,' another cries,
'His can 't be seen, you see: perhaps
His ears, which can be seen, he flaps,
And thinks him flying—from the flies!'

The jockey's scorn, the jeerer's aim,
Meanwhile the horse and rider both
In mutual weakness, mutual shame,
Hear."

The mutual shame can be understood, but why is the weakness said to be reciprocal? There seems to be some uncertainty.

Perhaps the best lines in the book are two in which the poet's Brother Guy, who was probably thinking of Emerson's "Humble Bee," is seen to

"Chase the sultry butterflies,
Tropic summers in disguise,"

and three which speak of the journey of a pioneer across the Western prairies,

"A journey long and slow and perilous,
With many hardships and the homesick look
Of wife and children backward."

As a pretty fair specimen of the author's powers we copy a little piece called "The Love-Letter:"

"I greet thee, loving letter—
Unopened kiss thee free,
And dream her lips within thee
Give back the kiss to me.

"The fragrant little rose-leaf
She sends by thee is come;
Ah, in her heart was blooming
The rose she stole it from."

We were pleased at first with the bold horticultural trope in the second stanza. But perhaps it was suggested by that rose-bush in the ballad. We quote from our recollection of it as we heard it sung:

"Lady Annet they buried within the churchyard,
Lord Lovell they laid down beside her,
And out of her bosom there grew a red rose,
And out of his backbone a briar-iar-iar," etc.;

or, the stanza being ambiguous, the rose-leaf may not be a literal rose-leaf, in which case the poem is neat and pretty.

MAGAZINES FOR MAY.

The "Atlantic Monthly" for May is good, but does not contain much that is of novelty or importance. The reminiscences of Landor are unusually interesting. Hawthorne's "Diary" still continues to be the most admirable model for would-be novelists and magazine writers we know of. Anybody who works as conscientiously over mere studies as he worked need not, with even moderate ability, despair of some measure of success. The "Fenian Idea," we believe, by Miss Cobbe, proves that she is not at home in the discussion of political topics. The idea of a revolution, or of an attempt at revolution, is to be found not in what the ignorant masses expect to come of it, which is what she describes, but in the grievances which have prompted it. Doubtless great multitudes went into the French revolution of 1848 expecting a community of goods, but it was not this idea which overthrew Louis Philippe. The Fenian idea is the desire of the Irish for a government that is not English, for an ecclesiastical establishment that is not foreign, and for fixity of tenure in land. None of these are absurdities. The absurdities of Fenianism lie in the attempt to overthrow the British Empire by an organization of servant-girls and hod-carriers and stablemen. A very slight acquaintance with the literature and traditions of conquered countries would have shown Miss Cobbe that there is nothing peculiarly Irish in the extravagant pictures of the old "kings" drawn by the popular imagination. Wattled cabins, like the halls of Tara, in fact generally rise, under the wand of that great magician, into marble palaces, donkeys into thoroughbreds, and a few hundreds of bare-legged gillies or kernes into hosts of glittering warriors. The gem of the number is Hosea Biglow's "Speech in March Meeting," which is, like all his efforts, beyond criticism. Edwin Booth is the subject of an elaborate critique, which shows that gentleman to be an absolutely faultless actor. The literary notices are unwontedly savage, and, for the first time, if we are not mistaken, will "cause pain to many sensitive minds." There is nothing in the number that can be called "padding," and to say this of a magazine in these days is very high praise. Mrs. Stowe's paper on dress is remarkably good.

With this number "Harper's" closes its thirty-second volume. To a large part of the American people "Harper's" for many years has been English literature, and it has been so very successful that we may consider it a fair index of the literary culture and general character—of the nation, we had almost said, but a nation's character and culture are fairly measured by its best—of that immense class of Americans, we will say, who after paying for their newspaper are willing to spend a quarter of a dollar a month for somewhat better reading. On the whole their magazine does them no great discredit. Their morality seems to be unquestionable. Their patriotism is immeasurable; of the lives and exploits of famous American citizens—of the men who fill Jared Sparks's works and have counties called after them—they read and never tire. Mr. Abbott's histories they not only read, but they like to read. Stories of adventure please them; easy lessons in the natural sciences, pictorial accounts of men and manners in foreign lands, and of the more distant regions of their own vast possessions. It is to be confessed, too, that their hearts seem to throb sympathetically with the hearts of a great multitude of the most commonplace young lovers, and that they are too apt when they first receive "the new number" to turn first to that wonderful "Editor's Drawer," a piece of furniture surely far removed from the "Editor's Easy Chair."

In this last number the best article is "Cast Away," a sketch of life upon a desert island in the Pacific; which is very well done and seemed to us a true story. "The Flag that Talks" is three or four pages of stanzas full of loyalty and written in praise of the signal-service. There are three or four more chapters of "Armadale," which is as long as if Wilkie Collins knew that he cannot depend on his readers to go back to one of his stories after they have once got to the end and the answer. "Tom Lowdowne" is a very poor allegory in which we are to find the story of the rebellion and emancipation, and in which we do find it very much too easily. "Marriage à la mode" speaks of Dr. Johnson, and says, "Had Johnson been a gentleman in manner as he was a giant in intellect, his career might have been a brilliant one." The acuteness of this remark is matched by the truthfulness of another one. As to marriages in America the author says, "Wherever fashion reigns, those who so far transgress her rules as to keep their marriage vows (and there are many such) must hide their shameful vulgarity from notice, or a contemptuous cry is raised of 'Darby and Joan,' 'uxoriousness,' 'vegetation.'" One sighs sometimes for Johnson's comprehensive method of dealing with such people. "The American People Starved and Poisoned," "the aim of which is to lead to a Christian method of building," treats of the importance of ventilation, and gives plans whereby houses may be so constructed that the inmates, whether they wish it or not, may always have sweet air. "Longwood," "Kate," and "Queen's Good Work," are poor love stories, "Longwood" being best and "Queen's Good Work" worst, everything in it, and particularly that negress with her talk and her songs, being impossible and undesirable. There are three illustrated articles, "Galena and its Lead Mines," "The Yo Semite Valley," and "Livingstone's Last African Expedition," which will all be found readable.

Six out of fifteen articles in the "Catholic World" are original. "Problems of the Age" is the first of a series of controversial papers, and invites the reader "to begin at once at the viewing point of the Catholic believer, and endeavor to get the view which one brought up in the church takes of divine truth"—in other words, to approach the consideration of Roman Catholic doctrinal questions not by the road usually followed, but as a Roman Catholic child would. "A Troubadour's Story" is continued, and to be continued. There is a Wizard Knight in it, a Lord of Miolan, "Ho Eblis," a ladye called the Lily of Provence, the Chateau of La Sône, Siloë's wave, a queer jumble of Savoy, Syria, and France, plenty of alliteration, and plenty of such rhymes as

"—— racked and riven with remorse,
Mad with the memory of the Cross;"
"Maiden mantle that is part of thee,
Maiden mantle that doth circle thee."

"Requiem Æternam" is very much better and not good. "Curiosities of Animal Life" is a short and pleasant talk about the various modes of reproduction which obtain among the sea anemones and other animals of the lowest forms of organic life. "The Catholic Publication Society" says that, by means of tracts gratuitously distributed, "other denominations are instructing their people and producing an influence on many outside of their

own communions." Both these things Catholics also ought to do, and they are called on for contributions. In the last article, "New Publications," Dr. Pusey's famous "Eirenicon" is once more reviewed, and Dr. Pusey is once more told that "there is not the faintest chance of any re-union of Christians except by a return to the centre of unity. Strict dogmatic unity and unconditional submission to the supreme authority of the See of Peter is the only condition of union in ecclesiastical fellowship." Of the selected articles the best is Aubrey De Vere's "Mater Divinæ Gratiæ," a beautiful poem, which ends, perfect, before the last stanza begins.

RESEMBLANCES BETWEEN MEN AND ANIMALS.*

In Dr. Redfield's opinion the science of comparative physiognomy is as good if not better than that of phrenology, and he feels himself as much entitled to judge character by the face as by what lies behind the face; he reminds his readers that in portraits the skull always remains in the background. Again, the brain and the face are generally harmonious, but the former is always subservient to the latter; phrenology must be professional "by fumbling up the hair and rubbing the organs," which in most cases, we agree with Dr. Redfield, would be regarded as a great impertinence, while comparative physiognomists pursue their vocation silently, and learn a man's character without his knowing it. Still, we can hardly admit this to be a social advantage, for though it is certainly not "a breach of etiquette to look a man in the countenance," still, to look a man out of countenance, and to make a mental note of him as cat, dog, or rhinoceros, produces, at least in the observer, almost a consciousness of rudeness. We have ourselves studied faces in a small way, and have always felt a certain impoliteness in the occupation, as we smiled in a friendly way, but said to ourselves "rogue" or "fool." There seems something more open about craniometry, to which no man, unless he wishes, need submit himself, and where there is a fair understanding between the student and his subject; there is a connection, too, between this pursuit and an equally honorable and more ancient profession. There would be nothing unnatural in the union of barber and phrenologist. But to have scientific men at large who, without our knowledge, might read our characters, and, unlocking our closets, rattle down the skeletons which we had almost forgotten, would be disagreeable. We should soon have experts appointed by Government to inspect applicants for office, and registering them as vultures, camels, or goats. It would be unpleasant to go as a lion and come back a goose.

Nevertheless, these personal objections should not prevail against the progress of knowledge, and the knowledge of which Dr. Redfield is the herald, after Lavater, is that a relationship may be discovered between the faces of animals and those of men; that by studying the characters of the former we may arrive at the characters of men who resemble them. Or the result may be reached in another way. Studying the character of the human subject, we find the inferior order which has the same traits, and the exterior likeness will be at once apparent. For instance, Captain Cook was a discoverer; the stork is a discoverer, and a remarkable likeness is seen between the two. The Aztec children awaken a feeling of repugnance, playfulness, curiosity, and fondness. "However much you may feel a disinclination to touch them, you will be ready to spring upon them as the embodiments of a truth, and clasp them to your hearts." This truth is, that the feeling of repugnance, curiosity, playfulness, and fondness is the same that mice inspire. On looking at the Aztec children they are seen to resemble mice.

It would be impossible to discuss Dr. Redfield's theory in full, to investigate the resemblance of Germans to lions, of Russians to geese, of Turks to turkeys, of Englishmen to bulls, of Yankees to bears, of Hindus to swans, and of Frenchmen to frogs; it will be better to take one chapter as an example of the rest, and, as a very interesting one, we choose that devoted to the elephant, particularly as it is connected with important questions of race. The elephant embodies the executive type. "As the rhinoceros represents endurance, so does the elephant represent effectiveness. His whole body is like a sea, with its ebb and flow, and moving forward with a slow current to its outlet, where the mighty force of descent invites to the demonstration of the principle that 'knowledge is power.'" "As there is in the rhinoceros that which involves the principles of mathematics, so there is in the elephant that which involves the principles of mechanics; and as nature illustrates these principles in the animal economy of both, so art, in those who resemble the rhinoceros and the elephant, applies them to the demonstration of the laws which govern the material creation and to the production of machinery." "There is a resemblance to the elephant not only in those who make an extensive application of machinery, but in those who invent it." Execution being at the root of the matter, we should expect to find elephantine men doing the work of the world in various capacities, and, knowing that a great deal of work has been done by "herculean negroes," we find, on a comparison, that they exhibit the elephantine type. From the valuable assistance they have given as slaves, we may infer that as free men they will be still more the elephant, and this is Dr. Redfield's opinion, who regrets the cramping effect of slavery, and has no doubt that the negro is capable of attaining the highest condition in morality and intelligence. We have always hoped sincerely that the color of his skin was no impediment, but we had not looked for a demonstration on purely physical principles. This is always the ground that the advocates of slavery considered their own; it is delightful to see it slip from under their feet. We do not know even why, carrying the analogy a little further, the negroes may not claim their blackness as an advantage, since certainly the elephant is more generally dark than light in hue. And if this is true, the white elephant would be the inferior species, and what folly would be greater than that of the King of Siam? There is another question which might afford subject for much curious study in connection with the executive qualities of the elephant—whether this type is discoverable generally among the Presidents of the United States; how far Washington, or Tyler, or Johnson were qualified in this respect for their posts; and, again, whether the inferior type may be seen in the inferior executive officer, as in the sheriff or marshal. But the field is too wide for the limits of a single article, and we can only refer to Dr. Redfield's book as illustrating the general topic in a variety of interesting and novel ways.

Roebuck. A Novel. (M. Doolady, New York.)—The anonymous chevalier who has added this contribution to the fiction of the late civil war is evidently concerned to make it appear that the nobler civilization went to the wall. Aside from the wholesale denunciations of Northern society which are reproduced as if the Confederacy were yet living, the author's method is to set off the Fairfaxes and Fitzhughs of Virginia against a transplanted Yankee by the name of Palmer. Colonel Fairfax is your model gentleman whose habitat is only on the warmer side of Mason and Dixon's line. On his plantation, his aristocratic negroes run from a "mean white" overseer with supplications of—"Master, would you jis please to switch me *yourse'f* —jis dis once, master." The sons of mechanics in the neighborhood look up to the same bright exemplar, and let their ambition go no further. Miss Fairfax is a person who, on trying occasions, discharges the natural tribute of affection and grief with a gush of tears, and then rapidly reviews the circumstances by which she is surrounded. At other times she sings "The Song of the Bee," "The Southern Cavalier," a dirge to Virginia, or a hymn of distress. She has the good fortune to see her father die without taking the Federal oath of allegiance, and she eventually marries Hugh Fitzhugh, late of the rebel cavalry. His superiority shines out early in the leaping of a stone-wall, at which Albert Palmer baulked, preferring to ride through the gate. This sure proof of ignoble blood in the latter is afterwards confirmed by his retreating precipitately from a duel, and presently deserting to the Federal ranks. The case against the North is thus completely made out, or would be, but for a single disagreeable query: May not civilization be measured by the greatest amount of abuse that a man will put up with in his own house with the smallest show of temper? We submit this question to the author of "Roebuck" and his New York publisher.

Baked Meats of the Funeral. A Collection of Essays, Poems, Speeches, Histories, and Banquets. By Private Miles O'Reilly, late of the 47th Regiment N. Y. Volunteer Infantry, 10th Army Corps. (Carleton, New York.)—This book, with its very elaborate and very absurd title, contains the dullest pleasantry that we have seen in print for a long time. According to the advertisements it is a comic book, but there is hardly anything laughable in it except the self-satisfaction of the author. He dwells with fondness on himself; on his intimacy with General H. W. Halleck; on the fact that the London *Times* copied an article which he wrote on Fenianism; on his having written a very smart and sarcastic despatch to the Secretary of War, and he tells us how the House laughed when it was read, and how S. S. Cox, of Ohio, assured him that it prevented his making a long-meditated speech, it was so funny; and, finally, on the fact that he can produce quite worthless verses with less waste of time than most people would suppose. He seems to belong to a class of writers who are willing to take Maginn as a model, and who are hardly able to reach Maginn's most doubtful excellences. The author has done better than this before, so that he is the less excusable for doing so badly now, and we speak so plainly to him because his preface informs us that he intends to put forth another book in December. Among the many poor verses of this volume there are some clever ones, and the account of Hunter's campaign in the Shenandoah Valley may have some value to future writers.

The Boys at Dr. Murray's (by Glance Gaylord; Graves & Young, Boston) is a well-managed, undisguised moral tale, illustrating the nobility of true friendship, and showing how an untrained but not evil nature may be rescued from error by kindly sympathy and forbearance.

* "Comparative Physiognomy; or, Resemblances between Men and Animals. By James W. Redfield, M.D." New York: Widdleton, 1866. Pp. 334.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of The Nation *should be addressed to the Editor.*

A WORD TO OUR CONTRIBUTORS AND OUR READERS.

It was well known that The Nation was, when started, essentially an experiment. Journals of a similar character had been tried and had succeeded in Europe, but the idea that there was enough interest felt here in literature or in art to support a paper mainly devoted to the discussion of literary and art topics, or that there existed what economists call an effective demand for any more careful or more general discussion of political news than writers of the daily press working between dusk and dawn were able to supply, was scouted by many. Our experience, so far as it has gone, satisfies us that it is this want of faith rather than want of appreciation which is the greatest difficulty which any such journal has to contend with here. Thousands enjoy it for the one who believes that his neighbors will enjoy it, and, of course, any very widespread doubt of its success increases the difficulty of succeeding.

Another difficulty, and the only one which any special mention by us will assist in removing, is the want of a clear comprehension on the part of great numbers of its readers as to the precise nature of the functions which such a paper as The Nation seeks to perform. There is, perhaps, nothing from which this journal in particular has suffered so much. Everybody had formed for himself, at the outset, an idea, generally rather vague, of the kind of paper a "first-class weekly" ought to be; but in nine cases out of ten it was an idea based on experience of some other paper already in existence. The consequence naturally was, often, a good deal of disappointment. To many who had for years read a party organ diligently, it was not enough that certain great principles of society or government were advocated; they desired to have them advocated in the precise manner and by the precise means fixed upon by party conventions, party leaders, or consecrated by newspaper usage. Others again, to whom the political crisis was a subject of absorbing interest, looked upon all attention devoted to art or literature or science as sheer trifling, as if real, long-continued progress was possible in any community in whose eyes they did not occupy, after religion, the highest place; as if in them were not to be found the ideas which make political contests anything better than a game of dominoes. Others, too, to whom writers for the press are simply so many clerks employed to put the crude and half-formed ideas of readers into shape for printing, were naturally shocked by being presented, in a journal for which they had paid in advance, with ideas which had never once occurred to them, and whose very novelty made them seem monstrous.

The Nation has now outlived a great deal of misunderstanding. Whether they think it good, bad, or indifferent, most people know what it is aiming at, and are able to state pretty clearly why they like or dislike it. We have received such assurances of the interest and satisfaction with which our enterprise is viewed as convince us that we have at least acquired what must form the basis of all permanent success for any such paper as this aims to be—the good opinion and good wishes of those who know best what good writing, clear thinking, and sound criticism are, and to whom the country owes not only the larger part, but the better part, of its fame.

From this class we have received not only much encouragement, but much assistance. Some of the best articles which have appeared in The Nation have come from the pens of volunteers on whom we had no claim, and on whom we had never made any claim, and although we do not rely on irregular contributors as a general thing, we have little doubt that the longer the paper lives, the greater will be the amount of help we shall receive from this source. Should this expectation prove correct, let us add, one of the objects for which the paper was established—the provision of a journal in which cultivated and thinking men, who unfortunately write only too little for periodicals, will oftener consider it worth while to send such thoughts as passing events may suggest to them—will have been attained.

We are able to say now, what a year ago we could only assume, that there does exist in the United States a demand, already large, for a journal, such as The Nation, of a special character, and that it is a demand which is as sure to increase as the country to grow in wealth and population. We are satisfied, too, that this demand is met better by The Nation than it has ever been met before, and it is with the hope of meeting it more effectually than hitherto that we have determined to issue the paper at shorter intervals. The comments which the announcement of this change has called forth have been, considered as critiques on the general character of the paper, very gratifying, but many of the inferences drawn from it, such as that it is a virtual surrender of our special character, and a step towards assimilation to the daily press, are erroneous, as we hope to show. We shall, perhaps, best show it by indicating the classes of readers whose wants we find by experience we have hitherto done most to supply:

1. Those who desire information on matters of science, literature, and art, which the ordinary newspapers do not systematically furnish, but who have not time enough to read journals exclusively devoted to these subjects; or who, being specially interested in one branch of science or literature, like to hear at frequent intervals of what is going on in others.

2. Those—and the number is every day increasing—whose daily duties occupy their time and mind to such an extent as to prevent their giving much attention to the vast, heterogeneous mass of news of the day presented to them by the daily papers, and who yet desire and appreciate some assistance in discriminating between the true and the false, the important and the sensational, and who enjoy discussions of political subjects conducted with more care than a daily paper can bestow and more candor than a mere party paper is willing to exhibit.

It will thus be seen that The Nation is neither a newspaper, nor a magazine, nor a review. It does not propose to give the news of the day—any more than it ever has done. Its comments on the news of the day are designed to be more deliberate than those of the daily press, even though they be less fresh. We issue twice a week, not that we may say more or a greater number of things, or that we may be able to talk about everything that occurs up to the moment of going to press, but that whatever we have to say may reach our readers sooner after it has been committed to paper than hitherto. In other words, the change we make means neither more hasty thinking nor more hasty writing, but simply more frequent and rapid printing and publishing. In certain departments, such as the financial review and the short notes on passing events, of course, the smaller the interval between writing and publishing, the more valuable they become. No matter how much wisdom may be crowded into them, they are in their very nature, to a certain extent, perishable commodities.

We propose, too, to give hereafter the literary, artistic, and scientific news somewhat more in detail than we have hitherto done. Of the desirableness of this we have abundant reason to feel satisfied. But it ought to be well understood that just as we leave to the daily press the task of supplying the news of the day and commenting on it as it flies by, so also we must leave to publications exclusively devoted to these subjects, and to quarterly and monthly reviews, the task of presenting the public with the results of literary and scientific research *in extenso*. To give the scholar or literary man an inkling of what is going on in the fields in which he is most interested, is all we can aspire to. And for the guidance of those who may feel disposed to assist us with their contributions, we may mention that the contents of The Nation will fall nearly under four divisions—or that, at all events, these divisions would have to be kept in mind by anybody writing for it as a volunteer.

1. References to, and concise comments on, the news of the day, with the view of fixing the degree of its importance, and suggesting its bearings upon and relation to the main current of contemporary history.

2. Reviews or comments, whether in the shape of letters or articles upon important events, and upon the utterances of those who are, or are trying to be, leaders of public opinion.

3. Accounts more or less detailed, or discussions of such occurrences in the social, literary, artistic, or scientific world as are likely to inter-

est men or women of education and intelligence. Under this head we do not include mere gossip about nobodies, or advertising chronicles of the sayings and doings of quacks, daubs, penny-a-liners, or dilettanti.

4. Critiques of publications or works of art of sufficient merit to make it desirable that the public should ever hear anything about them.

We shall take this opportunity of stating that the information which is occasionally given in those "inside views" of THE NATION to which some of our contemporaries occasionally treat their readers, as to the writers of certain articles and of certain departments of the paper, has been almost invariably wrong, and often amusingly wrong, and that anybody who feels any interest in the subject is no more likely to get at the facts in the columns of the country papers than in our own.

THE PROSPECTS OF A THIRD PARTY.

A FEW politicians, who have lost all power except for a little temporary mischief, are making great efforts to organize a new party to be devoted to the support of the President's policy. Like the fox of the ancient fable, having lost all their accustomed following, they are extremely anxious to induce other foxes to join their company. One thing they see very clearly, that unless a third party can be formed *they* will fall into insignificance, whatever may become of the policy they advocate. The Union party will never trust them again, and the remnant of the old Democratic party, which still keeps the field as a distinct organization, has not such a dearth of aspirants as to make it anxious to force high offices upon these gentlemen. It is quite willing to use them, but wisely unwilling to let them use it.

This cry for a new party is responded to by some papers and politicians of the South, who see what has become of the old Democratic party at the North, and are anxious to secure for their section a larger support here than they can hope for under the present condition of parties. The old Whigs of North Carolina, Kentucky, and Tennessee, who cannot forget the animosities of the past, embittered as was the recollection by the insane partisan spirit of Jefferson Davis during the insurrection, long for the appearance of some political organization which would enable them to put down the "radicals" without taking the name of "Democrats."

It is pretty well understood that these ideas find sympathy in high places, and that the new party, if it could be got under way, would not lack eminent leaders or official encouragement. And yet, with all these aids, we think the project certain to fail.

The organization of a third party is not an impossible task. The Anti-Masons, the Whigs, the Liberty party, the Free-Soilers, the Know-Nothings, the Republicans, and the Unionists, were all third parties, some of which rose to great power. But none of them attained success except those which were organized at a time when one of the two great parties was utterly demoralized and unable to hold together, or which were able to induce one of the old parties to merge itself entirely in the new. Thus the Whigs absorbed all the different parties opposed to the course of General Jackson; the Know-Nothings gained their marvellous but short-lived victories only when the continued existence of the Whig party had become manifestly impossible; the Republican party attained its magnificent proportions only when the Know-Nothings fell into chaos; and the Union party was organized by the voluntary act of the Republicans.

What is there in the present state of political affairs which at all corresponds with any of these circumstances? It is easy to talk of the disintegration of the Union party, but the simple fact that all the object of the proposed new party is to defeat the Union-Republicans, is a sufficient answer to these vain imaginings. Men do not labor to build up a new organization for the mere purpose of defeating one that is already falling to pieces. So easy a task may safely be left to an existing party. The Unionists will certainly not disband for the benefit of the new conservative scheme, nor will they lose any large proportion of their numbers. The only real question for consideration is whether the Copperheads will consent to drop the name of Democrat, and march under the new banner.

Why should they? That name is a tower of strength among the foreign-born population. In connection with the party traditions, it has a powerful hold upon a great portion of the native voters. Hundreds of thousands are proud to be called Democrats who would be rather ashamed to be called Conservatives. Their party ties would hang loosely upon them from the moment that its name was changed. For years they have voted unreasoningly whatever ticket bore the party label. Change the label, and they will scrutinize the bolus. Will the leaders of the party venture to run such a risk for the sake of winning over one-tenth of their present opponents? We confidently predict that they will not.

If the South is restored to a share in the national Government upon the present plan, leaving the truly loyal under the feet of recent traitors, there is not a doubt that it will unanimously support the Copperhead party under the name of Democrat. If it is not thus restored, the new party would fail to accomplish anything. To change for a merely temporary purpose would be running a great risk to effect an object which might possibly be achieved on easier terms.

A new conservative party, moreover, would have to accept leaders who are highly distasteful to the Copperheads. Mr. Seward, especially, is their peculiar aversion. Their leaders hate him cordially, but the rank and file abhor him with an intensity which the leaders could not control if they would. Yet what would the new party be without him? Messrs. Cowan and Doolittle are not so much disliked, but they can be had on easier terms than leadership. They have taken a course which will inevitably carry them into the Copperhead ranks as subordinates, and it would be a most superfluous bargain to change the party name for their benefit.

If, then, the Copperheads cannot be persuaded to abandon their present organization, the existence of the new party will be sickly and short. If it has no popular strength, though it may draw off enough votes to defeat the Union party in a few instances, it must speedily pass away. If it is strong, it must be so mainly at the expense of the Copperheads, and will thus do good rather than harm by dividing the opposition. If, to avoid this result, it resorts to coalitions, as did the Bell-Everett party in 1860, it will die out almost instantly.

If, however, contrary to our anticipations, the Copperheads should consent to abandon the name of Democrat, the final result to the country, in escaping from that swindle, will be highly beneficial. We do not believe that the cause of progress, liberty, and reform can be permanently defeated by any possible combination, and some transitory mishaps would be more than compensated by substituting principles for mere names in future political contests.

MR. JOHNSON'S ORATORY.

MANY of the personal characteristics of Mr. Johnson and many of his political errors are to be ascribed, we believe, to the fact that he is practically unacquainted with the qualities, dispositions, and feelings of a community each member of which stands on an equal footing with all the rest, and in which a general intelligence is promoted by a sense of common interest. He has had the misfortune to reside in a society divided by strongly marked distinctions of class, by opposing interests, and by prejudice on the one hand and ignorance on the other.

His political opinions and acts are the natural results of a character formed under such influences. What is best in them is the expression of certain native, strong, and generous tendencies, and of those great fundamental principles of American politics, the virtue of which, however enfeebled, could not be rendered wholly ineffectual in the slave States. What is worst in them is the expression of the warping and weakening of a vigorous but narrow nature under the strain of the false doctrines and ideas that have prevailed at the South ever since the formation of the Constitution.

The men whom the South has called statesmen and from whom it has accepted its chief political teaching have, with few exceptions, largely exhibited the qualities of demagogues. The conditions of Southern society—an aristocracy in combination with a nominal democracy—fostered the demagogic spirit in its leaders, and the long alliance between the slaveholders of the South and the miscalled Democratic party in the free States was essentially a league between

the demagogues of the one section and of the other, and was maintained and confirmed by purely demagogic arts and stratagems. The majority of the leading politicians at the South not only secretly despised the people, but, after denying the validity of democratic principles—the principles of the Declaration of Independence and of the Constitution—at length arrived, as we all remember, at open scorn of the people, scoffing at them as "mudsills," and suggesting the propriety of enslaving the working classes generally.

To the party of these men Mr. Johnson belonged during all his early public life. He was bred not only in their principles but to the use of their arts. Two causes united to save him from following them into rebellion: the first, we must believe, was a genuine love of the Union and hatred of treason; the second was a bitter ingrained animosity to that class of social aristocracy which had looked down upon him as a tailor, had shut its doors upon him in Nashville, and refused him admission within its exclusive ranks—exclusive of all not powerful enough to command admission on grounds of policy—and had thus wounded his pride.

But, though severing himself from his party, Mr. Johnson could not get rid of the effects of his training. He has, indeed, learned and unlearned much during the past five years; but his recent speeches and actions show how little he comprehends the moral instincts and sentiments of America, how completely he undervalues the intelligence of the people, and how readily he resorts to the arts of the demagogue who in his heart despises the crowd that he flatters and tries to mislead. His accidental position and fortuitous hold of power set his qualities in relief. There is a saying of Plutarch, cited by Lord Bacon, to the effect that men of weak abilities set in great place are like little statues set on great bases, made to appear the less by their advancement. It is so with Mr. Johnson. His faults might have escaped observation in the secondary position from which the stroke of fate uplifted him.

No man could have made a greater mistake, to speak of it by its lowest designation, than Mr. Johnson has done in using the oratorical arts once successful in Tennessee in dealing with the affairs of the nation. There is no people with whom those arts are likely to prevail less than with the people of the free States. As was well said in the admirable article on "The President on the Stump," in the last number of the "North American Review," "the majority of Americans have too much good sense to be flattered by an allusion to the humbleness of their Chief Magistrate's origin; the matter of interest for them being rather to ascertain what he has arrived at than where he started from, we do not mean in station, but in character, intelligence, and fitness for the place he occupies. The people do not take it as a compliment to be told that they have chosen a plebeian to the highest office, for they are not fond of a plebeian tone of mind or manners." When Mr. Johnson, in his recent speech to "the soldiers and sailors," says he wants to know why "the whole train of slanderers, calumniators, and traducers are barking and snapping at his heels," and answers his question with another, "Is it because I stand on the side of the people? And when I say the people, I include the sailors and soldiers," we have the very voice and tone which indicate how low an opinion the speaker has of that people of whom he professes himself the patron. His still more recent speech to the colored men exhibits the same qualities in so marked a degree as to read like a piece of the keenest satire. It is bitterer irony than Mr. Johnson's "slanderers, calumniators, and traducers" could invent.

VERSE-MAKING.

It was once the custom in many reviews, calling themselves Christian and civilized, and so regarded each by its private sect or following, to immolate at least one young poet quarterly at the shrine of stony-faced and rocky-bosomed criticism. It was esteemed a charming diversion, if not an act of religion, in the days of Mr. Gifford or of Mr. Wilson Croker, to make some timid and feeble rhymer ridiculous, to put him out of countenance by merciless sneering, and to demonstrate his foibles and failures for the amusement of a gigg in; public. Pope set the fashion of denouncing dunces, and all the writers who had bad hearts, and could string together ten-syllabled couplets, thought it manly and vigorous to follow his somewhat peevish example. Criticism, however purposeless and virulent, is apt to assume the airs of an offended and impatient morality, and to take credit to itself for smiting remorselessly and conscientiously. But imbecility, at least when it is inoffensive, should be privileged, and professional flaw-picking, exercised sheerly for the purpose of giving pain, is no more respectable than the professional flogging and pickling which prevailed not long ago in certain parts of the United States. At the same time, while avoiding all personal application, we may venture to point out a foible which is a well-marked and not altogether an encouraging characteristic of our own day, and to suggest to the innumerable writers of verse that, however much they may be permitted to sing for their own sake, the world just now has but small need of their wares. Goethe once boasted that, in all his life, he had "never thought about thinking," and we would enter a protest which we are sure is honest, and which we think is timely, against the making of verses for the sake of verse-making. Metrical indulgence, both in England and this country, has grown into an epidemical and inveterate habit, not cultivated as it should be, if at all, in a corner, but published to all the world, which is continually challenged to admire endless variations of a few themes long ago worn threadbare. Facility of execution, at best a natural or acquired knack, is mistaken for genuine inspiration; nor does there seem to be any pretence of considering whether the world is in need of any addition to its already large poetical stock. It is with the most sincere kindness that we take the liberty of pointing out, particularly to the young, the waste of time, of strength, and of mental serenity which this universal strumming involves.

Twenty years ago there was exhibited in London a machine, not the human product of a college, but literally a material machine, which made excellent Latin hexameters. The unfortunate inventor had spent thirteen precious years of his life in perfecting "the Eureka," as he called it. Without wasting our time in explaining this curious puzzle, it is enough to say that it actually ground out hexameters which were like those of Virgil in some respects, but considerably unlike them in others.

It seems to us that it is very much in this way that many modern brains produce what its authors call poetry, and its judicious critics verse. It is a literal making. The memory is full of phrases, the ear of familiar quantities; fashion or accident supplies the subject, and daily practice renders the construction easy. So skilful sometimes is this species of metrical manufacture, that it is hard to determine with accuracy, while we feel its deficiency, in what that deficiency consists. There is a modest respectability which deceives the careless reader who accepts sound for sense, without any suspicion of the trick which is played upon his ear. Coleridge once wrote a few verses of absolute nonsense in the manner of Dr. Darwin, which he read to a lady, who rewarded him by seriously exclaiming, "Ah, Mr. Coleridge, now I see that you *are* a poet." This we admit to be an extreme illustration; but there are thousands of rhymers now spinning longs and shorts, and sometimes confounding them, whose work, we must say unfortunately, has just sense enough in it to save it from wholesome and decisive condemnation. If they were absolute fools they would soon be laughed into silence; but as their stanzas are to a certain extent rational, the good-natured public receives them with a fatal affability, and has no call to forgive a mediocrity which it is too indolent or too indifferent to detect. Every editor receives bushels of verses which he might print, if he had but room for them, without any particular discredit to his taste or judgment. Their authors naturally do not understand their rejection. "Is not this," they say, "as good as Tennyson? Is it not, at least, very much like him? Does not this remind you of Mr. Browning? Might not this be mistaken for one of Mr. Longfellow's own productions?" Of course there is bitter disappointment.

We readily admit that verse-making is an elegant accomplishment, an innocent amusement, and a real auxiliary in the education of the mind to elevated habits and a daily recognition of the comely and ideal in spite of the pertinacious intrusion of the inevitable vulgarities of life. It is, or it can be trained to be, a protection against those low aims and selfish purposes into the adoption of which we are so easily betrayed. As the record of our best experiences and healthiest discipline, as a memorandum of our sincerest resolutions and most earnest regrets, as a relief to the sorrow which otherwise might too bitterly prey upon the mind, as a grateful tribute to love or to affection, as the natural expression of a certain class of noble and lovely thoughts, verse may be the readiest and most appropriate form of recording so much of our life as we wish especially to remember. It may train the hand as a fine landscape trains the eye, and make the best words and phrases habitual in our conversation. But the chief charm not less than the chief utility of this private verse-making is in its indomitable privacy, and in the indignation and just self-estimate with which it shrinks from publication. "I have painted many bad pictures," said a gentleman

in our hearing, "but I have never exhibited them;" and there was wisdom in the painting not less than in the privacy. It was well to paint—it was well also to conceal; it is well to write verse—it may be excellent to keep it in one's portfolio, to be resolute against sending it to the newspapers, to be chary of reading it to the best beloved and most patient of friends. It is certainly no argument against the validity of any composition that it embodies thoughts and feelings which, though novel to the individual, are yet common to the race; but this consideration diminishes the necessity and propriety of formal publication, and should warn us against the sheer vanity of parading truisms which, however fine and familiar, are truisms still. It is the secret of poetical vitality that it expresses what the majority of men have felt, and after one happy spirit has found fit words and music for the general thought, a mockery of the original song becomes easy to hundreds who sing from a recollection of what has pleased them, and ape the minstrel airs of the Byron of yesterday or of the Tennyson of to-day. It is wonderful how much clever journey-work of this kind is performed, and from one point of view it is encouraging, for the prevalence of this accomplishment does indicate, we are free to admit, a degree of popular refinement, and even a good deal of appreciative taste. But there is nothing new in it. We suppose that there was a mob of gentlemen in Rome who wrote easily, as we know that there was in England in the days of Dryden. But schools, magazines, newspapers, have made this poetical imitation cheap and common, while the passion for printing has kept pace with the multiplied mechanical facilities of printing—the power-press being responsible for thousands of volumes which nothing can save from oblivion, and which represent more heart-burning, more disappointment, and more ludicrous self-complacency than we care to compute. Poetry has grown to be like photography. We have all one's friends and acquaintances in our albums in their holiday raiment and with a perpetual putting on of their best looks; and altogether they are not worth so much to us as some old portrait of some unknown man or woman long ago dead, the painter of which knew the secret of avoiding that air of conscious propriety which no sitter before the camera can put off. There is no fault to be found with the photograph except the paradoxical one that it is so extremely like that it is not like at all. It is equally hard to say, sometimes, why or in what poetical disciples are not the equals of their masters; but the mysterious vice of imitation makes us indifferent to their best stanzas and deprives their finest tunes of the charm of sincerity. Byron said of Mr. Sotheby that he had imitated all the poets of his time, and had occasionally beaten all his models; yet a verse-maker more entirely forgotten than Mr. Sotheby we cannot at this moment remember.

We protest, in conclusion, that we have no quarrel with the *cacoëthes scribendi*, which we believe may often be turned to good account. It is from the folly of printing or of attempting to print that we would good-naturedly dissuade hundreds of estimable persons. The young gentleman who can make a clever sketch does not send it to the Artists' Exhibition. The young lady who can play tolerably well a concerto of Beethoven does not advertise a concert at the Academy. The best declaimer of the "private theatricals" does not apply to Mr. Wallack for an engagement. If we have amateur fiddlers and painters and pianists content with strictly domestic glory, why may we not have amateur versifiers building the lofty rhyme without the least ambition, and sending their sonnets to the seclusion of their desks, or to the albums of their gentle if not judicious friends? It may be pleasant to print, but it is also pleasant to burn; and to those who have never experienced the latter gratification, we cordially commend the experiment.

THE

NORTH AMERICAN REVIEW

FOR APRIL

Has won remarkable praise from the critics.

"The number of the 'Review' before us is, it may be safely said, the best that has ever appeared. The whole number is one of extraordinary interest and excellence."—*The Nation, April* 19.

"An unusually varied and interesting number."—*N. Y. Evening Post*.

"The April number of this quarterly is something to be proud of. It is filled with able and brilliant papers on topics of present and paramount interest."—*Boston Com. Bulletin*.

"Under the editorial management of Professor Lowell and Mr. Charles E. Norton this venerable periodical has quite renewed its youth. The present number contains an unusual variety of interesting matter."—*N. Y. Tribune*.

"A vital power in the literature and thought of the day."—*Worcester Spy*.

"There are half a dozen papers in it any one of which would go to make the fortune of the monthlies."—*Hartford Press*.

Single numbers, $1 50; Subscription price of "Review," $6 00 a year, in advance; to subscribers for any one of our other Periodicals, $5 00 a year.

☞ *We pay the postage on the "Review."*

IS

BROKEN TO HARNESS

"SLANGY?"

A gentleman of rare literary ability says in answer: "Nobody ever did talk as Addison wrote. The words of speech are of all forms and colors; the words of the pen are conventionally supposed to be, properly, only of certain approved forms and colors. But why shouldn't people write as they talk? If they can't, certainly a novel, which is for the most part dialogue, should be as near speech as possible, and should be as full of the fresh instant expressions of the time as common talk would be. We nowadays use condensed words; we describe things by a rapid etching, not by elaborate detail; we can't wait to be elegant—to curl and perfume the hair and adjust the buckles of a hundred years ago; but, accoutred as we are, we dash on in the express train with more individual ease and purpose, and quite as much safety, as our grandfathers by the slow, ponderous methods of their day.

"Now in this book men and women talk and act as men and women really do, and there is no more 'slang' in their speech, or 'fastness' in their acts, than there is in this living world. No, not nearly as much; for no book can perfectly photograph society. We think it a spirited delineation of life and manners—not, perhaps, as Mrs. Hannah More serenely and divinely saw, but as a living journalist sees, with open eyes, in modern London."

☞ The Third Edition is for sale everywhere.

LORING, Publisher,

BASSINI'S ART OF SINGING!

An Analytical, Physiological, and Practical System for the

CULTIVATION OF THE VOICE.

BY CARLO BASSINI.

Edited by R. Storrs Willis.

This work is one of the greatest excellence as a System of Thorough and entific Instruction in the Art of Vocalization. To say that as a book of this kind has no superior would be to award it but partial justice, since the best judges of the merits of such works readily admit that it has no equal.

Prices of Bassini's Method.

Complete.....$4
Abridged..... 3

Bassini's Method for Tenor Voice,

Comprising all the excellent features of the above Method for Soprano. Price $4.

FINANCIAL REVIEW.

NATION OFFICE, Monday Evening,
April 30, 1866.

GOLD has advanced to 129¼, closing this evening at 126⅛. Exchange has simultaneously risen to 108¼ for bankers' bills on London. One leading cause of the advance has been the cotton panic in England. Cotton fell in Liverpool 3½d. per lb. in a single week, making a fall of 6d. per lb. in less than two months—a decline quite unprecedented in the history of the cotton market. United States bonds have likewise declined from 74 dividend on, to 67½ dividend off. These changes, which foreshadow a diminished foreign enquiry for American cotton and United States securities, have naturally encouraged buyers and frightened sellers of coin. They would have proved less influential had the expected policy of the Secretary of the Treasury been actually inaugurated. But, though more than a fortnight has elapsed since the passage of the loan bill, not a word has been said in Washington about the long-promised contraction. On the contrary, the whole action of the Treasury Department, thus far, has tended to increase the supply of money at the financial centres, to reduce the rate of interest, to develop speculation, and, as a natural consequence, to impair the purchasing power of the currency. It is quite clear that if the currency is to remain as redundant as it is at present gold is by no means dear. If the Secretary of the Treasury is going to abandon the views expressed in his Fort Wayne speech and his annual report to Congress; if he is going over to the side of the paper-money men in Congress, and intends to postpone indefinitely the policy which only four months ago he pronounced indispensable to the safety of the nation, a premium on gold of 30 per cent., or even

40 or 50, would not be extravagant. Gold fell from 148 to 125 on the general belief that an honest effort was going to be made to resume specie payments. Congress refused to confer upon the Secretary the exorbitant powers which he solicited for the purpose of bringing about this result. But it conferred upon him powers ample enough to fund all the short-date obligations of Government, and to absorb a substantial portion of the idle money at the financial centres. He has not used those powers, or tried to use them. On the contrary, he has created so plethoric a money market that his debt certificates and 7.30 notes, all of which might have been funded at a discount, are now uniformly held at a premium. People are beginning to enquire whether the Fort Wayne speech and the Treasury Report really meant what they said, or whether they were *ad captandum* discourses, not intended to be carried into practical effect—stump speeches, to be forgotten after they had achieved their object?

A rather better feeling prevails in business circles, owing to the advance in gold and the non-appearance of the expected Treasury funding scheme. With the exception of cotton, which has fallen to 31 cents for middling uplands, in sympathy with the decline at Liverpool, all articles of merchandise are higher than they were a week ago, and in better demand at the advance. People generally are beginning to doubt about the future. Two and three months ago every one was satisfied that we were on the high road to resumption and that a shrinkage in prices was inevitable. The triumph of John Sherman and the other paper-money men in Congress gave the first shock to this creed; and now the inaction of the Secretary of the Treasury has unsettled it altogether. If it were generally understood that there was to be no contraction, business would revive at once, prices would rise, and we should in a few weeks be once more launched upon a wild sea of speculation.

Money is extremely easy. The rate for call loans is 4 to 5 per cent., the former being the rule on Governments, the latter on railway securities. The country banks, which are full of money, are trying hard to lend their deposits for 60 or 90 days at 5 per cent.; but speculators, feeling that for this once they have lenders at their mercy, prefer to borrow from day to day. Paragraphs in the Washington correspondence of the daily papers announce from time to time that the Secretary "is contemplating" a 5 per cent. loan, but thus far his contemplations have merely had the effect of putting his short-date obligations to a premium, and so blocking the path for an economical funding scheme. A 5 per cent. loan at the present time might prove a failure. In the first place, the 5 per cent. 10-40 bonds are offered at 95. So long as this is the case, it is doubtful whether even an absolute 50-year 5 per cent. loan could be placed at or near par. Again, in the Western States and at the South—considerably more than half the country—money is worth over 8 per cent. per annum, year in and year out. To draw this money into the Government coffers, 5 per cent. might prove too small a temptation. A long 6 per cent. bond would be likely to command attention. But why should a Western capitalist who can lend his money at 8 and 10 per cent. give it to Government at 5? Why should the holders of 7.30 notes exchange them for 5 per cent. bonds, when they can sell them at a premium, or, by simply holding them, receive seven-thirty per cent. in interest, and demand payment in full at maturity? And suppose Mr. McCulloch should offer a 5 per cent. bond, and people should decline to take it, how high would gold rise, and where would be the credit of Government?

The following table will show the course of the stock, gold, exchange, and money markets during the past week:

	April 14.	April 21.	April 30.	Advance.	Decline.
United States Sixes of 1881	104⅞	106	108	2	....
5-20 Bonds, old	103¾	104⅞	105⅞	1	...
5-20 Bonds of 1865	103⅞	104⅞	105⅞	1	....
10-40 Bonds	92	93⅜	95	1⅝	....
7.30 Notes, second series	100¾	101⅞	101⅞	....	....
New York Central	93⅛	93	92⅝	....	⅜
Erie Railway	72⅛	73⅛	73¼	....	¼
Hudson River	109 ex. d.	109	110¼	1¼	....
Reading Railroad	104¼	104	105¾	1¾	....
Michigan Southern	80	82⅛	78¾	....	3¼
Cleveland and Pittsburgh	79¾	81¼	81	....	¼
Chicago and North-western	26⅞	26⅞	28⅝	1¾	....
" " " Preferred	55¾	57¾	58¾	1	....
Chicago and Rock Island	119⅛	121⅛	122¾	1¼	....
P., Fort Wayne, and Chicago	91¼	97⅛	98⅝	1⅛	....
Canton	52⅜	52⅛	56	3⅞	....
Cumberland	44⅛	44⅛	45	⅛	....
Mariposa	13	11⅛	12⅛	1	....
American Gold	126⅜	126¾	126⅛	....	⅝
Bankers' Bills on London	107¾	107¾	108¾	⅛	....
Call Loans	5	5	5	....	....

A general advance took place in prices during last week, based altogether on the ease of money and growing doubts as to the sincerity of the Secretary's desire for contraction. To-day there has been some reaction. Excellent reasons might be given for a decline instead of an advance in stocks. Government securities are much higher here than abroad, and parties desiring to purchase would save money by sending their orders with the exchange to London. Railway business is steadily declining. On the very best authority, we report a falling off of not less than $10,000 a day on the New York Central, and $12,000 a day on the Erie—as compared with last year. An increase is reported in the papers in the traffic on the Michigan Southern and the Rock Island. But as it is known that in the course of the recent corners the directors have been saddled with the bulk of these stocks, these reports are not only disbelieved, but are received with derision. Experienced railroad men are confident that the earnings of all the roads will be less this year than last. Still, so abundant is the volume of paper money, and so despondent are the operators who pinned their faith to Mr. McCulloch's Fort Wayne speech and his Report to Congress, that prices rise steadily in the face of all reasons to the contrary, and the bears of Wall Street lose money daily. The New York Central relief bill has been returned to the Secretary of State without the Governor's assent; notwithstanding which, the stock is higher than it was a fortnight ago. Bankers are willing to lend 85 to 90 on the stock to borrowers in good credit, and there are plenty of speculators who are buying it up in expectation of a new carnival of speculation. A lively movement took place at one time last week in the Northwest stocks, which sold respectively as high as 59¾ and 31; they close considerably lower. Rock Island is dull but firm; the directors own the bulk of the stock, but would probably be willing to share with the public, if the latter were so disposed. Another spasmodic advance in Canton will be noted. Nothing further has transpired with regard to the purchase by Government. Michigan Southern is heavy and lower. The public show remarkable circumspection in dealing in this stock, and the cornerers may yet experience some loss in disposing of their stock. Fort Wayne has been as high as 101; it closes at 98½, after selling at one time to-day as low as 97¾. Among the people who, without being regular brokers or speculators, frequent Wall Street from time to time, and deal occasionally in stocks, the belief is gaining ground that the ease of money and the absence of any practical contraction will lead to fresh speculation in stocks and to higher prices, without regard to the intrinsic value of the properties dealt in. This theory will ensure its own verification if it be held by a sufficient number of persons. But the market is getting into a condition which would render a panic quite likely in the event of a change in the money market, or, what is more probable, an unexpected development of bankruptcy in a leading railway company.

IMPORTANT CHANGE IN THE DIVIDEND PERIODS

OF THE

EQUITABLE

LIFE ASSURANCE SOCIETY

OF THE

UNITED STATES,

92 BROADWAY, NEW YORK.

ACCUMULATED FUND.....$2,000,000.

ANNUAL INCOME.....$1,000,000.

PURELY MUTUAL.

ANNUAL CASH DIVIDENDS.

At the request of their numerous policy-holders, this Society have determined to declare their dividends ANNUALLY IN CASH: the first Dividend will be declared February 1, 1867. The last Dividend declared on the quinquennial plan reduced the premiums in some cases more than 50 per cent., or doubled the policy during the next dividend period. It is believed, for the future, that no Company in this country will be able to present greater advantages in its dividends to persons assuring than this Society, as its total expenditure to cash premium received was, by the last New York Insurance Report, less than that of any of the older American Life Insurance Companies.—*See Superintendent Barnes's Annual Report*, 1865.

The new business of this Society for the past year ($13,623,900) exceeds the new business of any New York Company in any previous year.—*See Superintendent Barnes's Annual Report*, 1865.

Hereafter Dividends on the first annual premium may be used as Cash in the payment of the Second Annual premium, and so on thereafter the dividend on each premium may be applied to the payment of the next succeeding premium. Policy-holders in most other Companies MUST WAIT FOUR OR FIVE YEARS before any advantage can be derived from Dividends.

The success of this Society has not been equalled by any Company either in this country or Europe, the Society's cash accumulation being over

ONE MILLION OF DOLLARS

greater than the most successful Company at the same period in its history, and its annual cash revenue from premiums, at the end of its sixth year, was greater than that of the largest company in the country at the end of its fifteenth.

Non-Forfeiture of Premiums.

In the case of whole life and endowment policies at ordinary ages in force for at least three years, the Society will, on due surrender, issue a Paid-up Policy for the full amount of premiums paid.

The Company will issue Policies on a single life to the extent of $25,000, but only in cases where the physical condition and family history of the applicant are entirely unexceptionable.

Permission is given at all times to visit Europe free of charge.

Extra Permits granted at moderate rates.

Make Your Own Soap with B. T. BABBITT'S Potash, in tin cans, 70 Washington Street, New York. Pure Concentrated Potash or Ready Soap Maker. Warranted double the strength of common Potash, and superior to any other saponifier or lye in the market. Put up in cans of one pound, two pounds, three pounds, six pounds, and twelve pounds, with full directions in English and German for making Hard and Soft Soap. One pound will make fifteen gallons of Soft Soap. No lime is required. Consumers will find this the cheapest Potash in market.

B. T. BABBITT,

64, 65, 66, 67, 68, 69, 70, 72, and 74 Washington St., N. Y.

Improvements in Piano-fortes.

One of the simplest and most truly valuable improvements yet made in the Piano-forte is that invented and patented by

DECKER BROTHERS, 91 BLEECKER STREET,

in this city. By correcting the only imperfections arising from the use of the full iron-plate, and that, too, by not detracting in the slightest degree from its many positive advantages, the Messrs. DECKER have developed in their instruments a tone at once admirable for its purity, fulness, prolongation, and sweetness, and the high estimation in which their improvement is held is well shown in the rapidly increasing business of their firm.—*Tribune.*

MARVIN'S

PATENT FIRE AND BURGLAR SAFE:

Superior to any others in the following particulars:
They are more fire-proof.
They are more burglar-proof.
They are perfectly dry.
They do not lose their fire-proof qualities by age.
Manufactured only by

MARVIN & CO., 265 Broadway.

FLORENCE SEWING MACHINE CO.,

505 BROADWAY, N. Y.

THE BEST FAMILY MACHINE IN THE WORLD.

Wonderful REVERSIBLE FEED MOTION. SELF-ADJUSTING Tension. No Snarling and Breaking Threads. FOUR distinct Stitches.

THE BEST SEWING-MACHINES IN THE WORLD.

THE WEED MACHINES,

With all their valuable improvements, entirely overcome all imperfections. They are superior to all others for family and manufacturing purposes, simple in construction, durable in all their parts, and readily understood. They have certainty of stitch on all kinds of fabrics, and are adapted to a wide range of work without change or adjustment, using all kinds of thread. Will hem, fell, bind, gather, braid, tuck, quilt, cord, and, in fact, do all kinds of work required by families or manufacturers. We invite all persons in search of an instrument to execute any kind of sewing now done by machinery to inspect them, and recommend all parties engaging in the sale of sewing machines to make sure they secure the best by examining the WEED before purchasing. They make the shuttle stitch, which cannot be excelled for firmness, elasticity, durability, and elegance of finish. They have received the highest premiums in every instance where they have been exhibited in competition with other standard machines. The company being duly licensed, the machines are protected against infringements or litigation.

Reliable agents wanted, to whom we offer great inducements. Every explanation will be cheerfully given to all, whether they wish to purchase or not. Descriptive circulars, together with specimens of their work, will be furnished to all who desire them by mail or otherwise.

WEED SEWING-MACHINE CO.,

Topics of the Day.

A most extraordinary illustration of the haste and carelessness with which the work of law-making is sometimes done in our State Legislatures has just been afforded at Albany. A bill was forced through the last session of the Legislature with unprecedented secresy and despatch, taxing the merchandise brokers one per cent. on all sales of wine and ardent spirits, one-half per cent. on all sales of goods imported from beyond the Cape of Good Hope, and on sales of all other goods three-quarters per cent. This tax would amount, in many cases, to more than three times the amount of the brokerage which the brokers usually receive, and, if levied, would, we believe, pay the interest on the national debt, and what is of more consequence, would reduce New York to the position of a third-class port, and drive its business to Philadelphia and Baltimore. The finishing touch was given to the measure by a clause ordering all brokers, no matter how long they may have been doing business, to give bonds for $500 with two freeholders as security. The act has created great excitement and confusion in business circles. This is bad enough, but it is not half as bad as the fact—for such we understand it to be, that Governor Fenton signed it as a matter of course, and without knowing anything of its real significance, and that the New York delegation were in their places all through the session and saw the thing done without a word of warning or remonstrance. The occurrence, however, may not prove wholly unprofitable, if it turn the attention of business men to the commercial danger of having a city like this represented in the State Legislature by the nominees of dance-houses and grogshops.

Mr. Davis, of Kentucky, has laid it down in the Senate that if four bodies of men meet in Washington, two professing to be the Senate of the United States, and two the House of Representatives, the President has discretionary power to decide which is the true and which the false Senate or House. The conclusion to which this doctrine points is, of course, not concealed. It would, in practice, arm the President with arbitrary power, and take away from Congress all right to judge of the qualifications of its members. Under it the Southern members might have seceded in 1860, and Mr. Buchanan have then pronounced them to be the true Congress, and have delivered the government over into their hands, and thus have saved them the trouble of fighting. Avowals like this of Davis's are mainly valuable as indicating the policy of the revolutionary party, and the nature of the danger with which we shall next have to contend.

Mr. Trumbull, we are glad to say, has succeeded in inserting an amendment to the post-office appropriation bill, providing that no person appointed during the recess of the Senate by the President to fill a vacancy not caused by death, resignation, expiration of term of office, or misconduct, shall receive any salary or compensation for his services. This, if sustained by the House and passed over the President's veto, for he will doubtless veto it, would be the first step towards a return to the practice of the earlier days of the Government, and would inflict the first blow on one of the most corrupt and corrupting practices of our day—the practice of making terms of office depend not on good behavior, but on political subserviency. The President professes horror of concentration of power; he has now a chance to prove his sincerity in a very striking way.

The officers of the Board of Health think that one case of cholera has occurred within the city limits. An Irishwoman living in the eastern part of the city, in a crowded tenement-house, fell sick on the afternoon of Monday last and died on Tuesday morning. The physician who attended her, and the physicians of the Board whom he called in to view the body, united in the opinion that her disease had been cholera. The Board is still at work, and we notice, and think it worth recording, that its Sanitary Committee has reported favorably upon the request of the homœopathic physicians to be assigned to hospitals. There is nothing like panic in the city, and there is no increasing of the disease at the quarantine ground. A second case is reported on Mulberry Street.

The committee appointed by the English bondholders of the Confederacy to look after their interests have submitted a series of propositions to Mr. Seward of a most extraordinary character. They seem to have come, at last, to the conclusion that they have been swindled by Erlanger & Co., the Confederate agents, and ask to have Erlanger's contract with the Confederate government supplied to them, as evidence, we presume, to be used in a suit. They also offer, if something handsome be done by the United States, or the several States, or somebody, with regard to the payment of these bonds, to get up a loan in London to aid in the development of the resources of the South. The correspondence is curious mainly as exhibiting the state of mind of the bondholders, who seem to be a stupid set of men, anxious to make money, decidedly indifferent as to means, and to have furnished splendid food for the sharks of the Confederacy. Mr. Seward dismisses the whole subject rather contemptuously, but the wonder to us is that he should have thought it worth while to sum the correspondence up as elaborately as he has done.

There is a most extraordinary despatch from Commodore Rodgers, giving an account of his attempt to prevent the bombardment of Valparaiso by the Spaniards. "Strict neutrality" had been enjoined on him by his instructions, but he offered to go beyond his orders if the English admiral would join him. The reasons he gives for his course are curious, as showing the tendency which prevails amongst our naval officers on foreign stations to shape the national policy on high moral or other high grounds. He proposed to interfere first "to keep the peace." Second, to prevent breaches of what neutral naval officers con-

sider "the law;" and lastly because "Chili having reached the goal in human progress marked by the establishment of religious toleration, Spain, on a point of etiquette, rather than from any great political end, as he believed, proposed to burn the property and destroy the towns along the sea coast as far as she saw fit." This is funny reading, but it is a literal quotation from the commodore's despatch. All his arguments are stale, having been freely used in France and England during our war to justify French and English intervention. We hope Mr. Welles has by this time addressed to him a line reminding him that it is Mr. Seward's business to deal with those abstruse questions, and that his (the commodore's) business is to sail or fight his squadron. We congratulate the Government on having such an experienced, accomplished, acute, and skilful diplomatist as General Kilpatrick in Chili, at the present juncture. He and Captain Rodgers, between them, will shed new light on a good many vexed questions of international law.

THE news from Germany is more re-assuring than heretofore. On the one side, the adventurous proposition of Count Bismark, addressed to the Germanic Diet, concerning the convocation of a general deliberative parliament, based on universal suffrage, to decide on Prussia's schemes for a re-organization of Germany, seems to have had an effect no little discouraging to the cabinet of Berlin. The people, in meetings as well as in the press, loudly express their unwillingness to follow as leader in so momentous a work a statesman whose whole career has been an unbroken series of flagrant encroachments upon constitutional rights and popular freedom. The secondary states of the Confederation, with the exception of Hanover and Electoral Hesse, which are prevented by the necessities of their geographical position, are concerting, under the lead of the Saxon minister Von Beust and the Bavarian, Von der Pfordten, a common line of action in reference to the aggressive moves of Prussia, which may serve to counterbalance the advantages to the latter of an alliance with Italy, who is said to be arming both by land and sea. On the other hand, Austria, slowly, if at all, advancing in her attempt to conciliate the Hungarians, terribly embarrassed by her financial condition, and undoubtedly anxious about the intentions of Russia, who is not idle in view of the new complications in the Danubian Principalities, shows a growing desire to come to terms with her German rival, even on unfavorable conditions. She is now asserted to have submitted to Prussia propositions for mutual disarmaments, according to which she was to reduce her military establishment on the 25th of April, and Prussia to do the like on the following day—a slight surrender, which would augment the previous advantages of the latter power in the Schleswig-Holstein question.

The Paris conference for the re-adjustment of the Moldo-Wallachian affairs shows no progress. In the meanwhile this question becomes more and more complicated. Prince Charles of Hohenzollern, by a kind of mock election, improvised by the provisional government, has been chosen to the Rouman throne, made vacant by the revolutionary overthrow of Prince Couza in February last. It is doubtful whether the German prince will accept a dignity already rejected by the Duke of Flanders, and very unlikely that the election should meet with an easy confirmation on the part of the Porte or of the "guaranteeing" powers. A bloody outbreak, attributed to Russian machinations, took place at Jassy on the 14th of April, the object of which was the separation of Moldavia from Wallachia. It was easily suppressed.

On the 15th an attempt to assassinate the Emperor Alexander was made at St. Petersburg by a disaffected nobleman. It failed by the timely interposition of a peasant, who pushed aside the assassin's pistol. Had it succeeded, the emancipator of the Russian serfs would have perished on the first anniversary of the death of Mr. Lincoln, the emancipator of the American slaves.

The election in the French Department of Bas-Rhin, which attracted so much attention, is over. The Government candidate, M. Bussière, has been elected by a majority of almost two-thirds of the votes cast. The friends of the distinguished Liberal candidate, M. Laboulaye, console themselves with the considerable democratic gain in the city of Strasburg.

The Upper House of the Hungarian Diet has adopted the second address of the Lower House, a work of Francis Deák.

CONGRESS.

DIARY.

Monday, April 30, 1866.—In the Senate, a bill for the construction of bridges across the Mississippi, and establishing them as post-roads, was passed. The Post-office appropriation bill was discussed, on an amendment proposed by Mr. Trumbull withholding compensation to officers appointed by the President without the advice and consent of the Senate.

In the House, Mr. Julian's resolution in favor of the speedy trial of Jefferson Davis was referred to the Judiciary Committee. Mr. Stevens, from the Joint Committee on Reconstruction, reported a proposed amendment of the Constitution, providing for equality of civil rights in all the States; for apportioning representatives to population, after deducting the numbers disfranchised for other cause than rebellion; for disfranchising in elections held for Congress and President until 1870 all voluntary participants in the rebellion; and prohibiting the United States or any State from paying rebel debts or compensation for slaves. Made a special order for May 8. The same committee reported a bill for the admission into Congress of senators and representatives from any State ratifying the above amendment, as soon as it shall have become a part of the constitution and said representatives have taken the required oaths of office. Also, a bill declaring certain persons lately in rebellion ineligible to office under the Government of the United States. The river and harbor bill, making appropriations for the survey and improvement of many harbors and rivers important to national commerce, was passed. A special committee to investigate charges against the Provost-Marshal-General's Bureau was ordered.

May 1.—In the Senate, a joint resolution, extending the time for the completion of the eastern division of the Union Pacific Railway to June 27, 1866, and extending the time for succeeding sections about one year, was passed. A long debate on the President's power of removal took place, with no conclusion.

In the House, Senate resolution appropriating $4,200,000 *per annum* for collecting the customs revenue was passed. A bill to regulate immigration in passenger ships was passed. A resolution requesting the President to instruct officers of the Freedmen's Bureau to provide for starving citizens of Alabama was passed. The bill making appropriations for the support of the Freedmen's Bureau was passed—yeas, 79; nays, 41. The bill to construct a ship canal around Niagara Falls was passed, the House previously refusing to lay it on the table by a vote of 32 to 85.

THE FREEDMEN.

THE April number of the *American Freedman*, organ of the American Freedmen's and Union Commission, undertakes for the first time to give a comprehensive and, as nearly as possible, accurate view of the number of schools at the South, their location by States and towns, and the societies by which they are sustained. According to the tables South Carolina is the most favored, having 129 schools in operation; Virginia next, with 104; then follow North Carolina, 80; Tennessee, 65; Maryland, 61; District of Columbia, 41; Georgia, 31; Florida, 29; Alabama, 28; Mississippi, 20; Arkansas, 10; Missouri, 8; Louisiana, 6; Kentucky, 5; Kansas, 4; Illinois, 3; Ohio, 1; in all, 613. Taking South Carolina and Kentucky as the extremes of the formerly slaveholding States, it appears that so far as the opportunities for a new life and a speedy regeneration are concerned, it has been for the latter State rather a misfortune than otherwise that she did not succeed in seceding together with the former.

—Dr. Wilson, principal of a freedmen's school in Columbus, Miss., having been threatened by persons hostile to his profession, the common council of the city passed resolutions condemning these menaces and promising protection to Dr. Wilson and his assistants whilst engaged in their lawful pursuits.

—The bill making appropriations for the Bureau for the year commencing January 1, 1866, passed the House on Tuesday. The items amount to upwards of ten million dollars; $21,000 being assigned for school superintendents, and $500,000 (in place of $3,000,000, as originally reported) for sites for school-houses and asylums.

—Telegraphic despatches represent that a serious riot broke out in Memphis, in the southern part of the city, on Tuesday evening, occasioned by an attempt of the police to arrest a white man whom the negroes desired to protect. The troops were called out and restored order, which was interrupted again in the morning by a renewal of hostilities, in which, as on the day before, both black and white men lost their lives. "Fears are entertained," says the second despatch, Wednesday evening, "that the negroes will attempt to burn the city, but they are groundless up to the present time." The third despatch, a little later, says: "Fires are raging in South Memphis *among the negro quarters*. No effort is being made to quench the fires." It is impossible at this hour to fix the responsibility for this unhappy conflict.

Notes.

LITERARY.

Late French journals bring us intelligence of the death of M. Gustave de Beaumont, in Paris, at the age of sixty-five. M. de Beaumont will be remembered by the readers of De Tocqueville as having accompanied the latter in his famous visit to this country in 1831, and as having edited the latest editions of De Tocqueville's works, to which he contributed much new and valuable matter. Elected member of the Chamber of Deputies in 1839, he distinguished himself as a political economist; nine years later he was appointed ambassador to Vienna, a post which he soon resigned. The *coup d'état* was his exit from political life—a happy one, as regarded his literary reputation, since it afforded him an opportunity for study and reflection. He published many works, among others one on the social, religious, and political condition of Ireland; a second on "Slavery in the United States." His most important work is, perhaps, his "Treatise on the Penitentiary System of the United States and its application to France." M. de Beaumont was a member of the French Institute, where his death has left a vacant chair to be sought after and intrigued for.

—Those who are curious as regards the history of royal impostors in general, and in particular as regards those who passed themselves off as Don Sebastian of Portugal, after the death of that "madcap youth" in the sands of Africa, may be interested in knowing that a volume has been written upon the last by Don Miguel d'Autas, Portuguese chancellor of legation at the French court, under the title of "Les Faux Don Sebastien, Etude sur l'Histoire de Portugal." Beginning with a biography of Don Sebastian, which rivals that of any hero of old romance, especially in its fatal and mysterious close, Don Miguel d'Autas proceeds to give us the history of the false Sebastians—the King of Penamacor, Matheus Alvarès, Gabriel de Espinosa, and Marco Tulio—and of the means by which they succeeded in imposing themselves and their claims upon the credulity of the Portuguese people, who would not believe for a long time that their king was really dead. This curious episode of imposture is worth all the study which the writer has bestowed upon it, standing pre-eminent as it does in the checkered history of royalty.

—Dr. A. Büchner, who possesses the rather remarkable talent of writing well in four different languages, Latin, German, English, and French, has just published in the last a work upon the comedies of Shakespeare, which he considers vastly inferior to his tragedies, ranking Shakespeare as a comic writer far below Molière, and even Ben Jonson. Sadness, he thinks, is the chief element of the English stage, the comic element being merely introduced to relieve its sombre aspect, and to divert for a moment the overwrought attention of the spectators. This is true, in a certain sense, of its profoundest efforts, as "Hamlet," "Lear," and "Othello," but it would not be easy, we fancy, to convince the students of Shakespeare in this country and England that the grave-diggers in "Hamlet," the fool in "Lear," *Falstaff* in "Henry IV.," and other comic characters in Shakespeare's tragedies, were merely thrown in to light up the shadows and to make the groundlings laugh. In Shakespeare, as in human life, the comic and tragic elements are inextricably mingled, Dr. Büchner and his thesis to the contrary notwithstanding.

—The course of the authorities of the Roman Catholic Church is often as inexplicable in literature as in theology. A case in point has recently come to light, being that of Professor Tischendorf, who has a European reputation from his discovery of the Biblical text known as the "Codex Sinaiticus," and who was recently sent to Rome by the Emperor of Russia to compare it with the "Codex Vaticanus," which was published many years ago by Cardinal Mai. In the course of his studies Professor Tischendorf discovered many grave errors in the latter which he was naturally anxious to correct. He arrived in Rome and was presented to the Pope, from whom he obtained permission to examine the "Codex Vaticanus." He went to the Vatican for several mornings and pursued his labors, but was finally stopped by the intimation that the permission which had been extended to him was suspended. Why it was suspended he was not able to learn, nor, at the last accounts, had he been able to resume his studies in the Vatican. A few years since, the University of Oxford requested of the Roman authorities photographic copies, of the size of the original, of several texts of this same "Codex Vaticanus," among others of a portion of Matthew, extending from the 52d verse of the 27th chapter to the 10th verse of the 28th chapter inclusive, which request was promptly and decidedly refused. There must be something in all this, one cannot help thinking, adverse to the pretensions of the Catholic Church, theological as well as literary.

—The most absurd notions which have ever obtained in regard to the cosmical phenomena are undoubtedly to be found in the legends and theories of the Buddhists, which have recently been made the subject of a volume by R. Spence Hardy. According to the Buddhist philosophers, the universe is peopled by innumerable worlds, in sections of threes. In the centre of each system there is a mountain one million six hundred and eighty miles from base to summit (there is nothing like exactness in trifles of this sort), which stands on a three-peaked rock, which stands in turn upon a world of stone. A stone ridge, or wall, runs round each system, thirty-six millions one hundred and three thousand five hundred miles in circumference. Between this wall and the central mountain are seven rocky circles and seven seas, the dimensions of which correspond to those already given. There is a sun and a moon to each system, but they are amazingly small compared to the worlds they are expected to light, the former being only fifteen hundred miles in circumference, and the latter just thirty miles less. Eclipses are the work of a demon named Ráhu, who has a mouth three thousand miles deep, into which he occasionally crams "the greater and the lesser lights," which he does not attempt to hold, however, for fear the bawling gods should escape through the crown of his head, no easy feat, one would think, judging of its density by his proceedings. In the seas of the Buddhist worlds there are fish ten thousand miles long; and when one of these, who is only half that length, a playful little creature called the Timira Pingla, shakes his left ear the water is disturbed for five thousand miles about. The size of the birds corresponds in a measure with that of the fish, one being fifteen hundred miles long, while the trees on the average are not over one thousand miles high, which makes them, we should say, rather inconvenient roosting-places for the Buddhist birds. Not less, but rather more, extraordinary are the lions, which are of different colors, as black, dove-colored, yellow, and mealy—the latter species having mouths and feet as red as sealing-wax. At one spring they can jump eleven thousand two hundred feet, and can run fast enough to overtake the echo of their own voices.

—It is not a good thing to be a literary Bohemian in Bohemia, whatever it may be elsewhere. So at least we judge from a statement recently made by Kober, a well-known publisher of Prague, who says that books written in his vernacular not only do not pay, but entail a positive loss on their publisher, no matter how much they may be needed and however well they may be spoken of. He issues a prospectus of a "Französisch-Tschechisches Wörterbuch," by Dr. Gabriel, the MS. of which he purchased three years ago, and which he has but just made up his mind to publish at the cost of four thousand florins, a portion of which, he feels certain, will be lost, although the work in question is the first of its kind in Bohemian literature. As an instance of the loss which awaits such undertakings, he mentions Wojaczek's "Lateinisch-Deutsch-Tschechisches Lexicon," which everybody implored him to undertake, but which, when published, only found one hundred and fifty purchasers in two years. So with "Don Quixote," a beautiful book, with one hundred and fifty original illustrations by Manes and Purkynje, only three hundred and fifty copies of which were sold, while it required at least the sale of nine hundred copies to meet the mere outlay. This last failure might be accounted for on the ground that "Don Quixote" was a foreign work; but, unfortunately, the works of native writers fare no better in Bohemia, for Kober announces that he has been compelled to discontinue the publication of the "Tales and Romances of Karoline Swetla," the most noted of the Bohemian novelists.

SCIENTIFIC.

Preservation of Meat.—A novel and somewhat elaborate method of preserving meat is now being carried out upon the large scale in England, and appears to be attracting considerable attention there—the more, no doubt, because of the prevailing Rinderpest and the consequent dread that a scarcity of butcher's meat is imminent. A noteworthy peculiarity of the new process is that by means of it the flesh is preserved in the fresh, raw condition; no processes of cooking, such as are involved in the usual methods, being here applied. The joints of meat to be preserved are placed in tin canisters provided at either end with short metallic tubes. After their lids have been securely soldered, the canisters are placed in a strong iron chest, in the upper story of the factory, and, by means of elastic tubes, the bottom tube of each canister is attached to a pipe which runs along the floor of the chest, while the upper tubes of the canisters are in like manner connected with a corresponding pipe at the top of the chest. Water is now caused to flow into the chest and canisters until both are completely filled with it; the lid of the chest is then shut and screwed down, so as to be air-tight. By means of the

water, the air which was previously in the canisters is almost entirely expelled. This first stage of the process being complete, the water supply is shut off, and the second part of the process begins. Connected with the floor of the chest are two perpendicular pipes which pass down to a well in the basement, a distance of upwards of thirty-five feet. One of these vertical pipes opens into the cavity of the chest, while the other is connected with the interior of the canisters by means of the horizontal pipe which runs along the floor of the chest. By opening the appropriate cocks, the first of the vertical pipes is placed in communication with the chest, and the second with the canisters. Two water barometers are thus formed; all the space within the canisters and chest being now a vacuum at the summits of these barometers. The chest is made strong enough to withstand the pressure of the atmosphere, and the vacuum is made within it in order that the tin canisters may not collapse upon being exhausted. When the water has all sunk down out of the canisters, as is ascertained by vacuum gauges, the cocks in the vertical pipes are closed and nitric-oxide gas is allowed to flow into the canisters and chest simultaneously. The nitric-oxide combines at once with any traces of oxygen which may still be adhering to the meat or tin, and neutralizes it completely. The chest and canisters are now again filled with water, which, as it enters, drives the nitric-oxide into an appropriate gas-holder. A vacuum is again created, and into it is finally made to flow a current of nitrogen gas mixed with a small proportion of the nitric-oxide. The lid of the chest is now opened, each one of the canisters is carefully lifted, its lower tube secured by first pinching and then soldering it; a quantity of sulphurous acid gas proportionate to the weight of the meat is then forcibly injected into each canister through the upper tube, which is then closed and soldered. The canisters are finally exposed to a temperature of 90° during several days in order to test their integrity, and are then sent to market.

The process in question will evidently be somewhat more expensive than the ordinary, well-known cooking process of Appert, but nevertheless promises to yield a product of so much higher quality that the extra cost will be more than compensated for. It would even appear that the inventors of the process as yet only seek to use it for the preservation of the better quality of meat, the best joints only of the animal being subjected to this process, while the coarser pieces of meat, and those of inferior grade, are treated by the old method of Appert. Attempts to apply the new process in the grazing districts of Australia are already in progress, and there seems at last to be some promise that the teeming life of the southern hemisphere may really become in some measure available to supply northern races with force needed for the advancement of northern civilization.

Supernumerary Fingers.—A discussion upon the subject of supernumerary fingers, which took place at a recent meeting of the Surgical Society of Paris, was somewhat remarkable for the discrepancy of opinion which was elicited as to the frequency of the occurrence, and is on that account interesting, as going to illustrate the freaks and accidents of which the statistician may be the sport.

One physician had observed numerous instances of extra fingers during a two years' residence at the Foundling Hospital; another could not regard the deformity as a rarity; while a third declared that among about 10,000 new-born infants which had come under his notice he had met with an extra finger but once; the fourth speaker asserted, on the contrary, that the deformity in question must be very common, for he had himself seen some fifteen cases; while the fifth stated that he had seen not only a great number of instances of supernumerary fingers, but even of supernumerary hands. Speaker number six remarked that during his twenty-five years' practice at the Maternité Hospital he had not met with more than ten of these cases, and that in a statistical record of the London and Vienna lying-in hospitals, comprising at least 14,000 children, it was shown that not a single instance of the deformity in question had occurred. The third speaker here re-entered the discussion for the purpose of remarking that the long service of his master (sixth speaker) at the Maternité, joined with his own observations at the same hospital and also at the Clinique, furnished the somewhat formidable number of from 90,000 to 100,000 infants, among whom only twelve or thirteen cases of extra fingers had been observed. At this point M. Velpeau turned the subject by speaking of the curious coincidences which chance often throws in the way of the medical practitioner, and cited, as an example from his own experience, the fact that he had once in private practice met with three instances of fracture of the neck of the thigh-bone upon the same day.

Manufacture of Chloroform.—As illustrating the extensive use which is now made of anæsthetic agents, it is noteworthy that, as recently stated by Prof. Simpson, the firm of Duncan, Flockhart & Co., of Edinburgh, make every day upwards of 7,000 doses of chloroform, counting two drachms as a full dose, or nearly 2,500,000 doses a year. In order to appreciate fully this statement, it must be borne in mind that it applies only to the product of a single manufactory, and that in many localities, as in the south of France and in our own country, sulphuric ether is employed to a much greater extent than chloroform for producing anæsthesia.

THE "CATHOLIC PARTY" OF CESARE CANTU AND AMERICAN SLAVERY.

Among the European notabilities who are now at Rome, the visitor probably most acceptable to the Pope and his confidential advisers is Cesare Cantù, of Milan, a member of the Italian Parliament, and the most prolific of Italian, if not of modern, historical writers. At the age of fifty, Cantù had composed and published a universal history in nineteen royal octavos, a history of the century between 1750 and 1850 in four smaller volumes, a history of the Italians in twelve large octavos, numerous historical works of less extent, some romances, and many essays, reviews, and pamphlets. His larger works had gone through many editions, successively revised by their author, and had been translated into more than one foreign language under the personal supervision of Cantù himself. The Americans are considered bold and rapid operators in book-making as well as in more purely material matters, but how poor does our literary enterprise appear when contrasted with such swift productiveness as this! Prescott and Bancroft devote a whole generation to historical study and composition, and with what results? Not above eight or ten moderate volumes apiece, and those embracing the history of but three or four countries for only as many centuries. The Italian, on the other hand, has surveyed all time, all space; and the entire labors of Marshall, Prescott, Bancroft, Motley, and Palfrey scarcely amount to half as many pages of letter-press as those of Cesare Cantù.

And yet his *furor scribendi* is by no means exhausted. He is now engaged on a voluminous history of Italian heresies and heretics, and one object—politicians think not the only one—of his present visit to Rome is the collecting of materials for this great work. The most secret recesses of the Vatican will be thrown open to him—under supervision, of course—and if he would make a judicious and candid use of the stores at his disposal he might produce a most important contribution to the history of the great struggle of the sixteenth century between the intellect and conscience of man on one side and ecclesiastical ambition and unreasoning authority on the other. He might show, for instance, the hollowness of that widely received but shallow platitude which—in the face of the notorious facts that southern France, with a Provençal population, is very largely Protestant, the northern departments, inhabited by the Norman and Germanic stock, almost exclusively Catholic; that the German Swiss cantons of Lucerne and Friburg are intensely Catholic, French Geneva ultra Protestant; that the great European school most thoroughly imbued with the principles of Jesuitism is the Belgian university of Louvain; and that, at this moment, even the Neapolitan clergy are half detached from Rome—continues to assert that the races of southern Europe are by nature essentially Catholic, those of the northern countries constitutionally inclined to a Protestant faith and ritual. He might further prove that in the sixteenth century the principles of the Reformation were received in Italy with as much avidity as in Germany itself; that the book of which the largest number of copies were sold in Italy for a hundred years after the invention of printing was Paleario's argument for the fundamental doctrines of Protestantism; and that nothing but the sword and the scaffold prevented the universal acceptance of those doctrines in Italy, and even in Spain, during the reign of Charles V. and his successor.

But the friends of the "priestcraft" which "never owns its juggles" need entertain no apprehension of indiscreet revelations from the pen of our historian. Cantù has not forgotten his old associations, or shaken off the principles he imbibed, the shackles he voluntarily assumed, in days long by-gone. He is what his countrymen, in a spirit of derisive, but too often unjust, sarcasm call a *prete spretato*, a dispriested priest, and thus belongs to a class of persons who are regarded in all Catholic countries with a certain degree of jealousy, if not of aversion. It is but fair to say that most Italian ecclesiastics who renounce their profession, renounce with it the narrowness and the superstition by which it is usually characterized. Some of the most liberal and enlightened statesmen of modern Italy, some even of her bravest and ablest soldiers, have once worn the cowl, and no small number of the most determined and generous champions of civil and religious liberty on both sides of the Atlantic are secularized priests who, in throwing off the uniform, have abjured also the creed of the Romish church.

But Cantù is far from being a good specimen of the enlightened body of secularized ecclesiastics designated by the epithet I have quoted. He is a bigoted sectarian, obscurantist in religion, and a retrograde in politics. So strong, indeed, is public opinion against him in Italy that, on his first election as a member of the national Parliament, about two years ago, a large majority of the Chamber of Deputies refused him admission to their body, as a man notoriously hostile to Italian liberty and the general interests of modern civilization. Upon his re-election, however, he was admitted to a seat; but he has remained a wholly uninfluential member, and it may be fairly said that his support is prejudicial to the success of any policy he espouses.

Cantù, though by no means an accurate or a comprehensive scholar, is well read in the ancient, mediæval, and modern literature of his own country. He is an industrious compiler, dexterous in the use of his materials, and plausible in the presentation of his conclusions. His historical works are attractive in style and lucid in arrangement and narrative; they are accompanied with appendixes of interesting illustrative matter and documentary evidence, and they are marked by an affectation of candor and liberality which, combined with a parade of citation and other historical proof, disarms suspicion and recommends them to superficial readers as impartial and trustworthy sources of information. Hence they had become very popular, and have been much used as convenient manuals by persons who do not by any means sympathize in the now well-understood principles and aims of their author. But searching criticism has convicted him of gross carelessness in citation of authorities, and of very numerous errors in statement, if not of positive and deliberate perversion of truth, and he no longer enjoys the confidence of competent critics in Italy as either a judicious or a fair-minded historian.

But, while he is losing character at home, he is gaining popularity abroad, and it may not be amiss to put American students on their guard against his forthcoming work, which, however it may be varnished over with a specious show of impartiality and Christian charity, will be in reality a covert sophism in defence of the detestable doctrines of the recent encyclical letter, namely, the temporal and spiritual supremacy of the Pope, and the right and duty of combating dissent from the dogmas of Rome with the old arguments of the rack and the fagot.

Americans in general are not familiar enough with the materials out of which the annals of the Old World are constructed to be competent judges of the soundness or fairness of Cantù's critical appreciation of the facts or principles of European history; but the following passages, which I translate literally from a note on page 763 of the sixth volume of the ninth Turinese edition of his "Universal History," revised by himself, and printed in 1865, will serve to give a just notion of his accuracy and love of truth in regard to American matters. It should be premised that the first paragraph of the extract is substantially a reprint from a former issue; the second was evidently written for the present edition:

"The number of the [United] States has now increased to fifty-one, and in the present century the population has risen from four to twenty-three millions. New York, which in 1793 numbered thirty-two thousand inhabitants, now counts above half a million. The Valley of the Mississippi, which then had a population of four hundred thousand souls, has now thirteen millions. Monroe, who afterwards became President, declared in 1828 that the Union claimed the right of intervention in the affairs of Europe, and that America belonged to the Americans, not to [foreign] colonists. On this ground they are continually threatening Cuba, and the incursions of daring chieftains, like Walker, who occupied Nicaragua, are only the preludes of new conquests, especially in Central America, which has now become important in reference to the communication between the two oceans, whether by railways or a canal. The Know Nothing faction is striving to secure the ascendency of the native element, not fearing for that object to brave the wrath of England, which submits even to insult to avoid a war which would deprive her of her supply of the cotton that furnishes subsistence to half her population. The Democratic party is always aiming to invade and absorb new territory, in order to introduce slavery into it, while the party called Catholic desires the abolition of slavery.

"The cause above indicated, namely, slavery, produced, in 1861, the outbreak of a war between the Northern and Southern States which cost 2,250 millions of dollars a day, and has sacrificed the whole prosperity of the country as well as an infinite number of lives. It was only in 1865 that the Southern States were again reduced to submission."

If we concede that historical honesty does not imply reasonable diligence on the part of a writer in ascertaining the actual character of the facts he sets forth, we may admit that most of the misstatements in the foregoing paragraphs were *innocently* made; but we must admit at the same time that the author's indifference to the truth is fully equal to his ignorance of it. In other words, if he did not know that he was misrepresenting facts, he cared as little whether he was or no, and framed his assertions to suit his purposes

But even this poor plea will not avail him in reference to the last clause of the first paragraph. The position of the "Catholic party" in America on the slavery question is as well understood in Europe as it is in the United States. In the second year of the war, the French Bishop of Orleans publicly attacked Bishop Hughes for his pro-slavery sentiments, and Montalembert has confessed and feelingly deplored the general complicity of European Catholicism in the sympathy of American Romanists with the cause of slavery and rebellion. Cantù's relations with Rome are so intimate that he could not possibly be ignorant of the fact, notorious to every political man not merely here in Rome, but throughout Italy, that the Pope and his court openly sympathized with and encouraged that cause through our whole struggle. Mr. Bancroft deserves the gratitude of his countrymen for drawing their attention to a truth which has been studiously disguised, and it is to be hoped that the thoughts of Americans may be turned much more earnestly to the fundamental connection between civil and religious liberty than for a long time they have been. Every man familiar with our party history knows that the American Catholics as a body have uniformly voted with the pro-slavery party, and it is too soon to forget that the Irish, who at the outbreak of the war affected enthusiasm for the Union, withdrew as far as possible from rendering aid to the national cause as soon as the war assumed an anti-slavery character on the part of the national government. He who knows how exclusively the political action of the Irish is controlled by their priesthood, and how submissive that priesthood is to Rome, will have no difficulty in conjecturing the source and cause of the cooling down of Hibernian zeal for the restoration of the Union.

Between all despotisms, temporal and spiritual, there is a solidarity. Lay and ecclesiastical princes sympathize in each other's triumphs, deplore each other's reverses. High churchism, irrespective of sect and country, Romish and Protestant, monarchical and republican, is everywhere hostile to every form of human liberty. During the late war our most rancorous European enemies were the clergy of the state churches. Christianity, as "established by law," asked no triumphs for institutions which proclaim that all men are equal before God as well as before the law, offered up no prayer that the rod of the oppressor might be broken and the bondman go free; and one need only have studied the columns of the *Saturday Review* and followed the fearful history of the recent troubles in Jamaica to perceive that even in enlightened Great Britain the "dissenter" and the democrat are as cordially hated as they are at benighted Barletta. VIATOR.

ROME, April 5, 1866.

PALFREY'S ABRIDGMENT.*

DR. PALFREY'S history has attained the dignity of an abridgment for popular use, being also eminently suitable for the use of schools, as we conceive. And this is no retrograde promotion, but a testimony to the substantial excellence of the work which will bear such reduction. However it may be with the heroes whose achievements are recorded in history, it is no disparagement to their historian—contrariwise, it is a compliment of a high order—to have it said of him, "Ut pueris placeat et declamatio fiat." We think that Dr. Palfrey will be found by the youth of America a gracious and engaging guide in the field he has chosen for his explorations. It is not always that an author is the fittest carver to cut himself down—to reduce by the Banting process works held to be too corpulent to a convenient macilency. But we think we can assure those of our readers who are not disposed to undertake the larger work that they can safely invest their time and money in the smaller one. The exhaustive fidelity of Dr. Palfrey's historical labors in his great work is guarantee enough that the lesser is as perfect as care and pains can make it.

It is obviously absurd to do more than speak in the most general terms of a work of the magnitude and laborious character of this "History of New England." It seems to us to be completely exhaustive of its subject, and that nothing remains for future writers in the field of enquiry to which Dr. Palfrey has limited his labors. The geography, the natural history, the meteorology, the manners and customs and way of living, the private as well as the public life of the most interesting race of which he treats, are all thoroughly examined and clearly set forth. A true son of New England, and full of the filial piety which marks and elevates the breed, he observes a judicial impartiality in relating and commenting upon their questionable actions—certainly setting down naught in malice, but as certainly ex enuating nothing. He gives due proportions to all the various parts into which New England is divided, and one rises from reading his work with a clear idea of the relative importance of the different colonies at that early time, of their relations to one another, and their effect on the later history of the

* "A History of New England, etc. Being an Abridgment of his 'History of New England during the Stuart Dynasty.' By John Gorham Palfrey." 2 vols. Hurd & Houghton, New York.

country. The transfusion of blood from one great member of the earth to another is one of the most interesting experiments—physical, physiological, psychological, and politico-economical—that the history of the world affords. This great experiment is yet going on and has not yet reached its crucial point. Thus far it has disappointed the theories of speculative philosophers as to its effect upon the free institutions which we have inherited through New England from Old England. The tremendous strain of the rebellion has been borne, and the prodigious change which the abolition of slavery, which flowed from it, has worked in the social condition of the South and in the political condition of the whole country, has been effected by the extraordinary commixture of blood and of nationalities of which the American people is now made up. The elasticity of temperament and of institutions which stood the tension of the rebellion, and the good sense, patience, and skill which are now called into action to make it a wholesome crisis instead of a malignant disease, lingering, if not mortal, we think may be reasonably attributed in a large measure to the New England element, which is found everywhere leavening the lump. The New England breed of men is singularly free from foreign blood. It is, as Dr. Palfrey says, "a type of the Englishman of the seventeenth century," and a type of the very best class of that time, "*Sincerum ab omni colluvione peregrini ac servilis sanguinis populum.*" With the excellent but unappreciable exceptions of the Huguenot and Scotch-Irish emigration, of 1685 and 1719, the New Englanders of today are of almost unmingled English blood—of the blood of the Englishman of 1642 and 1688. The great Irish and German emigrations of the last thirty years are things apart as yet, having had no perceptible effect on the race. The volumes of Dr. Palfrey tell the story of the gathering of the progenitors of this peculiar people in this New World, and of their hardships and their successes, and tell it well.

We do not doubt that the abridgment will answer a good purpose and meet the wants of a class of persons to whom the three large volumes might be a terror. But we should advise those whose courage or whose leisure is competent to the undertaking not to shrink from grappling with the work in its original shape. They will find it eminently readable and entertaining from beginning to end, full of curious and important matter, and, we believe, of impregnable authenticity.

Lays of the Scottish Cavaliers, and other Poems. By W. E. Aytoun. (W. J. Widdleton, New York.)—This is a new and pretty edition of a work that will long be popular. There is not much poetry, but occasionally, as in the "Execution of Montrose," there is a ring in the verse and a touch of energy that is able to stiffen a young lad's sinews as he declaims it, and summon up his blood, especially if the lad is Scottish and thinks himself a high Tory. Now that the day of democracy is come, ingenuous youth may be permitted to look backward and dream of feudalism, as the youth of threescore years ago looked forward and dreamed of pantisocracy and equal rights, until manhood comes to wake him.

PARIS GOSSIP.

PARIS, April 13, 1866.

SINCE the fashionable world has emerged from the penitentialities of Lent and the festivities of Easter, the principal feature of its gaieties has been a succession of brilliant "Bazaars," gotten up by various lady-leaders of Parisian dissipation, in aid of charitable societies patronized by them—the stalls having been held on these occasions by the proudest and most beautiful dames of the upper spheres of this gay capital. All these "Fancy Fairs" have proved splendid successes, that is to say, they have been crowded to suffocation, and have realized sums of money amazingly out of proportion to the intrinsic worth of the objects sold.

Among the most admired of the beautiful women, the sight of whom has constituted one of the main "attractions" of these gatherings, are three or four Americans, proclaimed, by common consent, "fairest of the fair." As several of the reigning belles of the American colony here are as conspicuous for the brilliance of *les beaux yeux de la cassette* of their respective papas as for the charms of their own visual organs, they are very dangerous rivals to the generally graceful, but rarely handsome, natives of this region, and are, accordingly, the objects of the most intense detestation of Parisian mammas, whose souls are perpetually vexed by seeing the highest prizes of the matrimonial lottery carried off by the fortunate daughters of "the Great Republic." Plenty of instances might be cited of fortunes and titles (some of the latter akin to royalty) thus won by American girls, to the immense disappointment and anger of maternal Paris, frustrated by these "interlopers" of the result of the patient net-spreading of successive seasons. Among other curious consequences of these intermarriages of Republican beauties with scions of European royalty may be mentioned the fact that charming Princess Helena of England, the especial darling of the widowed Queen "on whose dominions the sun sets not," will shortly, by her approaching marriage with Prince Christian of Augustenburg, become the niece of a lady of New York named Lee. The family of this lady established themselves some years ago in Paris, and speedily obtained a footing in the most fashionable circles of the capital. The elder of the two daughters married Baron Wachter, minister of Würtemberg to the court of the Tuileries; and the younger, soon afterwards, made a still more brilliant alliance, having captivated Prince Frederick of Augustenburg, brother of the late reigning Duke of Augustenburg, and uncle of the present Augustenburg princes. The marriage was solemnized at the American embassy in this city, and the prince and his bride started for the East on a wedding tour. Just as they had reached Beyrout, in Syria, the prince fell ill, and died. His widow returned to Paris to the house of her sister, Baroness Wachter, and is now about to become the aunt of an English princess.

It would be difficult to find a second group of sisters-in-law representing interests so violently contrasted as those which will thus have been brought together under the auspices of Queen Victoria. The Princess of Wales, daughter of King Christian of Denmark, the Crown Princess of Prussia, a Princess of Augustenburg, and Princess Alice of Hesse—which little state is menaced, like all the minor states of Germany, by what Austria calls the "insatiable land-greed" of her aggressive and unscrupulous rival—would seem to offer as pretty a set of elements for a family feud as could well be got together. In point of fact, they all seem to get on very amicably; but it can hardly be doubted that they must, at times, be conscious of a necessity for the exercise of something very like what would be called, in less exalted circles, "self-restraint." Happily for them, they are all kindly and amiable young women, and have been brought up not only in the habits of self-command so necessary in their position, but also with strong convictions on the subject of social conscientiousness and the sanctity of domestic peace.

Without attempting to divine the future of the "heir apparent" of the Napoleons, it may be stated, in general terms, that his youthful highness, just turned ten, is by no means an ordinary child, and that he already shows qualities that promise a maturity of no ordinary power. He is a handsome, well-formed boy, extremely active, both in mind and body; and though surrounded by all the observances of etiquette, really leads a life so simple and laborious as to remind one somewhat of that happy conceit by which Dickens shows us a young gentleman at a fashionable boarding-school being ceremoniously served, by a black-coated and white-gloved serving-man, with a penitential dinner of dry bread and water, advantageously displayed on a silver salver, with irreproachable accompaniments of silver fork, snowy napkin, and finger-glass.

The large room in which the young prince takes his lessons is plainly furnished, its principal piece of furniture being the large, low mahogany table, full of drawers and covered with leather, at which he works with his tutor, M. Mounier. On this table is a common porcelain inkstand, with pens and rulers of very democratic appearance. On either side of the inkstand are two small busts, of gold, of the Emperor and Empress and two miniatures of their Majesties painted on ivory, and, in front of these, a paperweight, whose marble base supports a figure of the First Napoleon, representing the founder of the house astride a chair in the traditional position, and admirably carved from a single block of ivory. At this table are two straw-bottomed chairs, one high and with its seat intact, being the usual seat of the tutor, and the other low, the edges of the seat worn and ragged, and the front rungs much the worse for the friction of restless feet, being that of the Imperial pupil. On the shelves of a small book-case are the works used for the prince's studies, containing a good many of the valuable elementary series written by M. Duruy, the present Minister of Public Instruction, and a collection of classical works, all plainly bound, worn, and dog's-eared. Besides the daily routine of book-lessons, with maps, globes, and the usual apparatus of the school-room, M. Mounier more particularly instructs his youthful pupil during the walks they take together. History is his favorite study, but all the phenomena of natural science interest him greatly, and he is never weary of talking of them. His powers of observation and investigation are remarkably developed for his age.

The little prince inherits from his father a very decided talent for drawing, paints prettily without having taken any lessons in the art, and copies maps and diagrams with remarkable correctness and neatness. During the Emperor's visit to Algeria, his Majesty having complained in one of his letters that he was greatly annoyed by the badness of the maps of the country, the little prince set to work with immense perseverance and activity, and prepared, with his own hands, a set of maps which he sent to the Emperor, and which the latter found to be far superior to any that he had been able

to obtain, and so useful that he wrote to the boy thanking him and telling him how much pleasure they had given him. The little prince dashes off pen-and-ink sketches with great boldness and spirit, and sometimes produces these compositions as *souvenirs* for persons presented to him. Thus, a few days ago, a literary gentleman, who had been presented to him, having begged Miss Shaw, his English governess, to ask his little highness to put his name to one of his drawings and give it to him, the prince, on receiving the request, replied, "I will make a drawing on purpose for him," and came a few minutes afterwards bringing in his hand the little composition he had just drawn, and which, the ink being still wet, represented a young man sitting under a tree and playing on a flute, with a dog sleeping at his feet. A huge oak fills the centre of the sketch, and to the right are shades of forest scenery. The prince, having signed this sketch and presented it, began to talk of his interest in the annals of empires in general, and of that of France in particular, and then took him to see the bust of his tutor, which he modelled entirely with his own hands, after quietly watching the manipulations of M. Carpeaux, to whom he had given several sittings for the bust of himself which the Empress had desired of that artist as a surprise for the Emperor on his return from Algeria. This bust, and also the one which he afterwards made of the Emperor, and which was placed on the Imperial table to await his Majesty's return from Algeria, though very roughly executed, are full of spirit, and striking likenesses. The "heir of the Napoleons" is very affable and unaffected, graceful and refined in appearance and manner, and grows every year more and more like his mother.

Some amusement has been created on both sides of the Channel by the determination of the Bretons to get up an "Eisteddfod," or general glorification of the old tongue, still so religiously cultivated in Wales, and formerly spoken on both banks of the Channel, and the invitation just addressed by the representatives of ancient Brittany to their brethren to come over and join in the proceedings. These will, no doubt, consist of the reading of essays asserting the superiority of the old British language to every other, of harp-playing, and the singing of extempore verses. Those distinguished Breton antiquaries, Viscount Hersaut de la Villemarqué and Count de Carné, will hold high festivals in their respective castles of Keransker and Marchallach during the "Eisteddfod," which is to be held next autumn at Vannes. To these two hospitable castles all the staunch Welch gentry are invited to repair, and it seems probable that the capacities of these and neighboring dwellings will be tested to the utmost by the descendants of King Arthur and his lusty knights.

THE MILITARY STRENGTH OF ITALY.

FLORENCE, April 13, 1866.

THE sole topics of conversation and speculation are "War or no war" and the fall of Italian funds. For a few days all the world believed in war, and now that the public has almost ceased to believe, the competent authorities shake their heads and say it is inevitable. That Italy will strike for Venice if Prussia bites as she barks, is certain; but then, Prussia caved in to Austria at Olmstud, and therefore may do so again. This time the retreat would be more disgraceful; but, then, liberal Prussia says that Prussia proper cannot be disgraced by the conduct of one man; that the King may throw Bismark overboard with profit to himself and his realm, and the smaller German states seem to be of the same opinion. As the case stands, the Prussian government has not only announced its intention of annexing the Duchies, and increasing, up to a certain point, its own power and territory, but also to change the military organization of the confederation; to concentrate in one hand all the forces of the north of Germany; to isolate Austria; to annul or considerably weaken the minor states. Will Austria consent to this? Will she allow the annexation, even if sanctioned by universal suffrage? Benedek, whose word is law, says: "Civilians have placed us in this predicament; only by the sword can we maintain our honor intact." Prussia hesitates; she has appealed to the minor States, who, while they have been taught by the Liberals that their only anchor of salvation lies in combination against Austria, have no love for Prussia, appeal to the eleventh article of the Federal contract, and, sheltering themselves under its provisos, wait to see who is strongest. The eleventh article runs thus:

"The Confederate states pledge themselves never to make war on each other, under any pretext whatsoever; never to settle their differences by force of arms, but to submit them to the Diet. The Diet will, by means of a commission, try mediation. If this fails, and if a judicial sentence be necessary, an extra legal jury must be formed, and the contending parties submit to its verdict without further appeal."

Thus the course to which Austria and Prussia are pledged is clearly indicated. If either, or both, refuse to fulfil the pledge, the Diet has the right to enforce its fulfilment; but if neither will submit, what can the other fifteen members of the German confederation hope to do? Clearly nothing. If, on the contrary, Austria and the larger states insist, the Diet will fulfil its mission, and Prussia must abide by the issue or illegally appeal to the sword.

Meanwhile the disputants are anxiously counting their relative numbers, and the Italians are no less eagerly calculating the forces which, by land or sea, they can muster for the occasion. A few days since the *Diritto*, the most influential newspaper of the parliamentary opposition, asserted that at the present moment Italy could not bring into the field more than 197,448 men, which statement the official organs indignantly denied, and to-day the War Minister, General D. Pettinengo, has published the following statement of the force and organization of the Italian army:

Officers under arms,	14,004
Non-commissioned officers and soldiers,	190,325
Officers on furlough,	1,754
Non-commissioned officers and soldiers on furlough,	148,660
Total,	354,743
In 1859 the sum total amounted to	83,299
Showing an increase of	271,444
Army, 1866,	354,740
Conscripts of 1842 and 1843,	150,000
" 1845,	30,000
Total,	534,740

In other words, something over the half-million proposed by Count Cavour. Of the officers, 8-16ths belong to the old kingdom of Sardinia; 2-16ths to Lombardy; 2-16ths to the Neapolitan provinces; 1-16th to Tuscany; 2-16ths to the other provinces of the realm; 1-16th to Venice and Rome. Half of the officers, therefore, have gone through the campaigns of 1848–9, the Crimea, and the campaigns of 1859–60; a fourth have served under Austria, the Grand-dukes, or Neapolitan sovereigns, the remainder under Garibaldi or against the brigands.

Of the men 30,000 have been, without interruption, under arms six years at least; 38,000 have been under arms for six years and on furlough for two and a half; 110,000 have served uninterruptedly from three to five years; 132,000 from fourteen months to four years; 29,000 belong to the *caribinieri* or to the military colleges and establishments, or are invalids; the last levy was only summoned on the 11th inst., so are raw recruits. This is the official statement; according to the "Almanac de Gotha," the Italian army, June, 1865, officers and soldiers included, stands on a war footing at 494,791.

We must take both the statements of the *Diritto* and of General De Pettinengo for what they are worth, and draw a line somewhere between the two.

According to an official document just distributed to the deputies of the lower House, the Italian navy stands thus:

IRON-CLADS.—Three first-class frigates—*Re d'Italia, Re di Portogallo, Roma;* the *Venezia*, now building at Genoa, and two others, "not yet christened," building, one at Castellamare, one at Spezzia; seven second-class frigates; two first-class sloops-of-war; two first-class gunboats; four second-class gunboats; two floating batteries. Total, 24; horse-power, 1,248; cannon, 448; men, 8,738.

SCREW STEAMERS.—Eight first-class frigates; three first-class sloops; three second-class sloops, one building; five gunboats. Total, 20; horse-power, 6,780; cannon, 544; men, 7,155.

PADDLE-WHEEL STEAMERS.—Three first-class sloops; seven second-class; three third-class; two first-class cutters; nine second-class. Total, 25; horse-power, 6,050; cannon, 118; crew, 3,381.

Transports (screw), 12; horse-power, 2,550; cannon, 24; crew, 1,092. Transports (paddle), 11; horse-power, 1,840; cannon, 12; crew, 634.

SAILING VESSELS.—One transport, third class; cannon, 2; crew, 26. Admiralty frigates, 2, and 1 sloop; cannon, 72; crew, 1,140. These, with four sailing vessels, are condemned as old-fashioned. Other four vessels—horse-power, 510; cannon, 59; crew, 1,049—are appropriated to the use of the naval colleges.

If these reports be trustworthy, and there can be little doubt about the navy, we must admit that General Lamarmora uttered no vain boast when he said that Italy was not only in a condition to wage war with Austria, but also to sustain a defeat.

J. W.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

DISFRANCHISEMENT AS A BASIS OF RECONSTRUCTION.

THE incorporation in the plan of reconstruction proposed by the Committee of Fifteen of a section requiring the consent of the Southern people to the disfranchisement of three-fourths of their own number as a condition of their re-admission to the Union, is the most striking illustration we have yet had of the want of practicalness by which some members of the Committee have all along been afflicted. The object of disfranchising the majority of the Southern people for a term of years is either to punish them or to deprive them of the power of mischief until they are restored to a better frame of mind and are likely to take part in the government as men devoted to it. But nothing we can now inflict on the South can possibly act as a punishment. The worst punishment it could possibly undergo was defeat in the war. To that we can add absolutely nothing that will produce either of the two great objects of punishment—the reform of the criminal or the supply of warning to others. If the South has not been convinced of the folly and wickedness of treason by the events of the last four years, it is not likely to be convinced by four years' exclusion from the polls. And if the next generation is not deterred from rebellion by the memory of their fathers' sufferings in the field, they are not likely to be deterred by hearing that no Southern man was allowed to vote at the presidential election of 1868. Persons convicted of felony are in this State, and, we believe, in every other, *ipso facto*, disfranchised; but how many crimes does any one suppose are prevented by this portion of the penalty?

The great objection which many of us feel now to the admission of the Southern people to the enjoyment of their old rights is based on what we hear of the determined disloyalty of their temper, and of the hostility which they still cherish to the Federal Government and to the people of the North. The number of us who ask for vengeance, is small; but we all ask for security for the future. Yet no better mode of keeping alive feelings of disloyalty and of irritation could be devised than disfranchisement on a great scale for an offence of which this generation at least does not see the moral guilt, and we greatly fear will never be got to see it, do what we may to open their eyes. Everything which looks like persecution will, of course, only irritate its objects, keep alive the old feelings of exasperation, and, by dividing the community into two classes—the one favored, the other outlawed—lay the foundation for hates and feuds of which we fear this century would not witness the termination. We doubt if any worse service could be rendered to the Union men of the South than the commission to them—a handful as they are—of power or privileges withheld from their neighbors. The curse of test oaths, and all the rest of the apparatus for ascertaining men's loyalty, is that it breeds and perpetuates social hates, and a republican community in which these have not only found a place, but are fostered by law, may be fairly said to be possessed by devils.

We are, for our part, for the abandonment of all attempt at punishment, or at anything which looks like punishment, except in the case of a few leaders, who worked their wickedness, knowingly, and who, far from suffering by the war, profited by it, and who ought to be made an example of for the benefit of all future plotters of revolution. We are opposed to the creation of any barriers or the resort to any means of future protection which takes the form of a penalty or a disabling act. The punishment of communities is a task for which neither our Government nor any other is competent. What we have to do with the South is to let by-gones be as far as possible by-gones, but to see that justice is done within her borders, that she does it and receives it. Our salvation lies not in restricting privileges, but in extending them; not in erecting a class for our defence, but in breaking down all class distinctions; not in perpetuating hates, but in leaving no man a reason for feeling wronged. In other words, as we said a few weeks ago, our policy of reconstruction should be based on inclusion, and not on exclusion.

Of this there is absolutely not one word in the reconstruction scheme of the Committee of Fifteen. There is proscription and disfranchisement throughout; but no trace of enfranchisement, and no mention of equal rights. And yet if any change is to be made by constitutional amendments, it would be far easier, in our opinion, to secure the assent of the South to one which now or at a certain fixed date would admit all classes to a share in the Government, than to one which for a certain term disfranchises four-fifths of the white men above the age of twenty-five for an offence which nine out of ten of them glory in.

SPAIN AND THE SOUTH AMERICAN REPUBLICS.

THE detention of the steamer *Meteor* by the United States authorities, and the subsequent examination of the Chilian consul for an alleged attempt to violate our neutrality laws, have called public attention to the present war between Spain and Chili.

With the exception of those merchants whose commercial interests were affected by the blockade of several important South American ports, few have given more than a passing notice to this struggle. When the theory of government is under discussion we always express much sympathy for our sister republics in the south. The practical knowledge which we possess of their condition, progress, and prospects is exceedingly limited. The French interference in Mexico has met general and oft-repeated popular remonstrance. But the movements of the Spanish forces in the South Pacific receive scarcely a comment. Yet, undoubtedly, Spain has entertained hopes of re-establishing her authority in her ancient colonies, and the seizure of the Chinchas in 1864 and the present war are measures adopted to discover if her hopes are based upon reasonable probabilities.

Underlying all other causes of trouble is that intense hatred of the Spaniard which exists in every South American republic. Long intervals of peaceful relations, social and commercial, have temporarily allayed the force of the feeling. But a slight agitation is sufficient to revive it with unabated intensity. The relation of Chili to Spain has been of a warmer and more friendly nature than that of Peru. But there has been no obliteration of old feuds. The government of each republic have endeavored to protect Spanish citizens resident within their territory in the enjoyment of their rights; and, except in seasons of ungovernable popular excitement, Spaniards in Chili and Peru have been unmolested in their business pursuits and avocations. The long residence of Tavira, Spanish minister to Chili, at Santiago was, socially considered, pleasant. He held the people of Chili in esteem and won the affection of numerous friends. He respected the people for their industry and persevering attempts against natural obstacles to build up a nation at the extreme south of the great American continent which might compare favorably with its older sister at the north.

When the Spanish squadron first arrived in the Pacific it consisted of two frigates and one gunboat. Of these the frigate *Triunfo* was destroyed by fire at the Chinchas in 1864. The squadron has since been reinforced by one iron-armored frigate, the *Numancia*, three ordinary frigates, one gunboat, and a transport steamer. They were received as peaceful visitors. Their officers were most hospitably entertained at Valparaiso, Callao, and Panama. But when, after their cruise in the North Pacific, they paid their second visit to Valparaiso, they met a cool reception. The rumor that Spain was making attempts to revindicate had preceded their arrival. Admiral Pinzon sailed from the Chili coast and met on his way north, either by accident or by agreement, Mazerrado, the violent commissioner to Peru, who had left Callao in a rage on the gunboat *Covadonga*, and immediately proceeded to take forcible possession of the Chincha Islands. When the news of this seizure reached Chili, the excitement was so great that the Government was unable to control the popular action. The spirit of resistance in Peru was tame compared with the forcible remonstrances which issued from Santiago and Valparaiso. The Government sympathized earnestly with Peru; and it is not unlikely that if Peru had manifested any resolute intention of defending herself, Chili would have joined with her in an alliance offensive and defensive. But, as Chili had no

direct cause of war on her own account, the Government endeavored to maintain a strict neutrality. The citizens, however, were beyond restraint, and in more than one instance the articles of the treaty between Spain and Chili were violated. Such infringements are not denied by that Government; yet all complicity with those of her citizens who were the guilty parties is strenuously denied. The following charges are the most important urged by the Spanish minister Tavira against the Government:

1. An excited mob surrounded the Spanish legation, insulting the ambassador, and conducting itself in the usual mob style, while no effective endeavors were made by the authorities to disperse it.

2. A paper, called *San Martin*, was permitted to publish daily attacks upon Spain of a most libellous, scurrilous character, which the Government did not suppress.

3. A schooner, called the *Dart*, owned by a Chilian citizen, sailed from Valparaiso to Callao, loaded with arms, and conveying one hundred Chilian volunteers for the Peruvian army.

4. After the declaration making coal contraband of war, French men-of-war were supplied with coal at Lota, and also the Peruvian gunboat *Lerzundi*, while this same privilege was refused to Spanish vessels.

5. The *Lerzundi* recruited seamen at Valparaiso and received provisions and naval stores necessary for her voyage to Callao. It was claimed that these acts of commission and omission were not only national insults to Spain, but highly prejudicial to her naval operations. Not simply a pecuniary reparation was demanded, but also a redress for the alleged slight to Spanish honor in the shape of a salute of twenty-one guns from some Chilian fort to the Spanish flag. Señor Covarrubias, the Chilian Minister of Foreign Affairs, in reply declared that his Government was not accountable for the acts of its citizens, inasmuch as its agents had, in each instance, exerted their utmost power to prevent violations of neutrality. Although we may suspect that, in a measure, the Government was responsible, yet Senor Tavira was so far satisfied with the rejoinder of the Chilian minister that he accepted a compromise, throwing out the pecuniary demand, and agreeing that a simultaneous salute should be fired from a Chilian port and a Spanish man-of-war. The late Admiral Pareja, who had succeeded Pinzon, refused to acknowledge this treaty. Tavira left the matter to the home Government, and, as previously stated, was not upheld. The mail which brought Tavira's recall conveyed to Admiral Pareja his appointment of minister to Chili, with full powers to do whatever he might deem expedient in regard to the negotiations with that nation. He immediately proceeded to Valparaiso with four frigates and one gunboat. This was an undue manifestation of defiance. He arrived at that port during the week in which the Chilians were celebrating the anniversary of their independence. A diplomatist, either prudent or desirous of promoting peaceful relations, would have paid a decent regard to national prejudices. On the contrary, he persisted, wilfully, in pursuing a course which would inevitably result in war. He made his demands, which were the same as those of Tavira, accompanying them with a threat, or an *ultimatum*, to the effect that, if his request was not complied with at the expiration of a given time, a blockade would be established. He turned a deaf ear to the remonstrances, solicitations even, of the members of the diplomatic corps at Santiago. Our minister, Mr. Nelson, was active in attempting to effect a conciliation. All offers of mediation were refused. The Chilian Government, ready before to make fair reparation, now considered itself insulted, and refused to comply on any other terms than those accepted by Tavira. The blockade was thereupon established by the Spanish squadron, and war declared by Chili.

There is no doubt that Chili would have been willing to avoid war by greater concessions to Pareja than she had given to Tavira. But the violence of the former in presenting his charges and demands excluded all hope of peace. Chili gains the sympathy of all who have thought her culpable, and her subsequent course in rejecting a Spanish insult is universally respected. The decisive measures adopted by her Government put to shame the vacillating policy of the Peruvian administration of General Pezet.

Thus we have described the causes which led to the adoption of warlike remedies. There have been few noteworthy occurrences in its conduct. The Spaniards have gained no advantage. The original blockade extended to only four of the forty ports of Chili. It afterwards included five. At present they are able to blockade only Valparaiso, which they have lately bombarded. Spanish commerce, although, as yet, threatened by no privateers actually afloat, has received a serious check from the mere apprehension of danger. They have lost their most efficient gunboat, which was captured by the Chilian sloop-of-war *Esmeralda*. They are at a great distance from a base of supplies. They have been so unsuccessful that the Spanish admiral, overwhelmed either by a perception of his own hastiness and its destructive consequences, or fearful that the issue might be entirely disastrous to Spain, avoided all further responsibility by taking refuge in suicide. Besides the capture of the *Covadonga*, Chili has been encouraged by the alliance of Peru, which brings to her assistance a respectable navy. The allied squadron is anchored in a little bay on the southern coast of Chili, the approach to which is exceedingly hazardous. They lost one frigate in entering the bay; but the guns were preserved and are now mounted on shore, where they will prove more effective than on the deck of the leaky *Amazonas*. The Spanish squadron has made one unsuccessful attempt to destroy the fleet. It is reported that the armored *Numancia* will make a second effort. But her ordnance is not heavy, and it is improbable that she can place it within range of the vessels. The commerce of Chili has been driven from the Pacific, consequently the war is most severely felt by her merchants. In other respects her people have not been seriously discommoded. The blockade of a few ports has driven foreign vessels to others less convenient, yet there has been no lack of articles usually imported which are necessary for consumption. Many of the vessels formerly under the Chilian flag have been transferred. A number of small brigs and schooners have been taken as prizes. But the value of all the captures amounts to a trifle. The Spanish admiral retained for a time a small steamer, but a question as to her nationality has deprived him of any benefit which he might otherwise have received from her capture.

Now that we come to consider the probable issue of this war, we mourn over its continuance. The naval force of Spain in the Pacific is nearly double that of the allied republics, the former having 217 guns, while the latter have only a force of about 130. But so long as the allied squadron remains in the present stronghold, which is the most secure refuge on the whole coast, it cannot be destroyed. There can be no advantage in prolonging the struggle. Spain is already bankrupt. The supplies for her Pacific squadron are sent from home at great expense. No dependence can be placed upon assistance from those adventurous voyages, one of which recently cleared with difficulty from Panama, which, in the end, are very expensive to the party purchasing their cargoes. If she *should* destroy the allied fleet, very little progress would be made in attaining her object. Her armies can never gain a foothold on the territory of Chili or Peru. The possession of the guano islands, with no recourse to the rich farms along the mainland, or the flour mills of Chili, far from any other source of supply, would not be profitable. Few vessels would transport her guano to a productive market. Her men-of-war would be in constant danger from expeditions organized by the energy and patriotism of her enemies. The tradition of Chili would be again exemplified, "that no Spanish vessel of war which came to the Pacific ever returned to the Atlantic." The bombardment of seaport towns will be a barren vengeance, calling forth a remonstrance from all nations. Neither can Peru or Chili gain any good from the war. They require every dollar of their revenue for the maintenance of their position as free and independent people. They have been too frequently delayed in their works of internal improvement. Revolutions have interrupted the growth of Peru. Chili is without the rich source of revenue with which Peru has been blessed, and is obliged to labor earnestly for self-support. The present war is a blight upon their prospects—an injury which can be repaired only by years of industry. Yet so long as Spain continues her hostile efforts the republics must make defence. Each party has made a sufficient display of courage to satisfy the claims of honor. Prudence ought now to have an audience, and the policy which she proposes should be accepted by both Spain and the republics.

THE SOLDIER'S REVENGE.

A.D. 1655.

THIS golden legend first was told
When Swedes and Danes were foes of old.

One morn the Swedes gave way so soon
The battle ended at the noon.

Two foes lay sweltering on the sand,
Each wounded by the other's hand.

The Swede exclaimed, "O day accurst,
That sees a soldier die of thirst!"

The Dane replied, with anguish wrung,
"My water-flask shall cool thy tongue.

"I filled it at a mountain-spring:
Drink thou to Denmark and the King!

'But precious loss if any drips;
So hold it steady to thy lips!"

The Swede replied, "If thee I kill,
Thy flask is mine to drink my fill!"

Then, drawing poniard from his girth,
He struck a blow, but stabbed the earth.

The Dane exclaimed, "O wretched Swede!
How durst thou try so base a deed?

"By heaven! I take revenge, O knave!"
Then, snatching back the flask he gave,

"Thirst thou," he cried, "while I shall quaff
Thy throat shall swallow only half!

"But curse thy loss, O dastard soul!
I meant to bid thee drink the whole."

The King of Denmark overheard,
And smiling at the deed and word,

Proclaimed in sight of all his train,
"I dub thee knight, O noble Dane!"

Uprose a noise of Danish cheers—
Heard yet through twice a hundred years.

So every hero hath reward—
Of men, of kings, or of the Lord!

THEODORE TILTON.

DOMESTIC UPHOLSTERY—WINDOW-CURTAINS.

CURTAINS are almost out of use among English-speaking moderns. Nor are they much used by any of those peoples who affect to be, in a particular and exclusive sense, "civilized." There has been a gradual abandonment of the custom, once universal, of hanging up pieces of woven stuff where the free passage of light and air would be objectionable; and the tendency now is toward a still more general forsaking of it. Nobody now hangs arras around his rooms with any other motive than a love of beautiful wall decoration. There are rooms lined with rep or with chintz, but it is plaited and drawn and tufted, and is to prevent echoes, as in the Stock Exchange, or for coolness, as in some summer boudoirs. Nobody puts up bed-curtains now; are there any yet remaining *in situ?* There are few four-post or canopy bedsteads still doing their work, and from those few the curtains have been torn away. In France, still, people have curtains over their chamber doors, but there are few in England and fewer still in America. A relic of the olden time remains in the huge leather curtains that hang down and fill the open doorways of churches in Roman Catholic Europe. But all that remains of the once dominant custom, for most of us, are the window-curtains which everybody has and which "no gentleman's windows should be without." Why these are the only curtains left is easy to see: it is only at the windows that light and air can enter unbidden, nowadays. Light, of course; and light is not always wanted unsubdued; but air also has more or less chance to make itself into draughts and currents about the windows. But still the tendency is to eliminate the curtains here, also. Our windows fit tight; for the sake of easily adjusted tight joints we relinquish the time-honored and seemly hinged sash, and our ugly sashes run up and down in grooves, counterpoised by weights. We reinforce our few hinged fillings of apertures with "weather-strips;" and, lest the passing off of heat from within outward should cause currents of air inside the glass, we adjust the double sash with air-chamber between. As for light, we have the handy inside shutters, solid or slatted, or in their place the "Venetian" blinds. An appliance, which is not a curtain but something like it, we constantly use—linen shades on rollers; white linen, buff, blue, very dark green, painted, ornamented with borders. And for the actual darkening of rooms at will, these roller-shades and the inside shutters, if present, are all that is used. For protection against the curiosity of people outside, there is lace and muslin, generally covering only a part of the window, and wire gauze stretched on a frame; these are not curtains. Nor are musquito nets curtains, whether on frames and set into windows or draped about bedsteads gracefully. On the other hand, those *are* curtains which surround and enclose shower-baths, but this division of the subject is not, æsthetically considered, an important one.

Window-curtains, then, are our subject; what is the law of their being? That they should be of some use, seems evident. Suppose a room with inside shutters to its windows, and light or dark linen shades on rollers close to the sash of the windows; in very many cases this room will not be the better for curtains at all. Or, if curtains for two openings are provided, the chances are that the doors will have more need of them than the windows. In small rooms, especially if rather too full of furniture—and it is in small rooms too full of furniture that city people live—window-curtains are apt to be a great annoyance. They prevent the convenient placing near the window of some piece that ought to be there. They either bully the inmate or else get torn and soiled themselves; and for danger—but our hands still tingle with reminiscences of burning window-curtains torn down ten years ago, and criticism ought to be unbiassed by personal considerations. It is a fact, however, that can be easily ascertained, that a room otherwise neat, and furnished and decorated without conspicuous violation of good taste, will generally be as effective without curtains as with them.

Curtains, as usually put up, are merely modest refusals to plead guilty to poverty or to carelessness. A family move into a hired house for the summer; it looks "bare;" but if brocade curtains are put up to the parlor windows they are supposed to assert something for the wealth of the new tenant; if muslin curtains are seen through the chamber windows they are thought to bear testimony to the neatness and management of his wife and daughters. But people ought not to mix the desire they may have for these declarations of their respectability with the idea that the beauty or comfort of a room is enhanced at the same time. Of what use are the decorations of this sort which are applied to the windows of fashionable parlors? There is a gilt or a walnut "cornice," from under which issues a broad surface of perfectly opaque and very heavy material, which divides just below the cornice, separates more and more widely as it descends, and is festooned finally over two pins or with two cords, leaving a curiously shaped bit of the outside daylight visible, the horizon for the whole width of the window, and a mere twinkling point a little higher up. This sort of curtain has one possible use: it can be dropped of a cold night from its festoons and made to keep the warmth in the room. But that is all that can be done with it. It is immovably fixed at the top; and when the light is wanted and the curtains are drawn back to their utmost, the little light that comes in comes horizontally, not white light from the sky, but reflected from houses, grass, and trees, feeble and impure. Any one who spends much time in rooms whose windows are curtained in this way knows how hard it is to read in them and how impossible to write in them, except near the window. In summer, while darkening they might cool the room; but in summer they are never in place; they are locked up in trunks until the fall, and for three months or so the light of heaven fills the room whose windows then have only thin lace hangings before them.

All non-transparent curtains should be made to run easily upon rings, supported by a thin brass or iron rod. They should admit of being easily thrown back to leave the window fully exposed to the light, and should be as easy to draw close. It is common in the French cities to arrange even the most costly and elegant curtains in this way, two cords with weighted tassels hanging down at the side, of which the one draws the curtains across the windows and the other folds them back to the jambs. When two windows are near together, as is usually the case with our city parlors, it will often be best to treat the whole end of the room as if it were a large

double window, and curtain it as if one opening. In all these cases, of course, the rods and rings should show and be made ornamental. There is no need of such huge thick gilded rods as were once fashionable, with bouquets and pine-apples at the ends, nor of gilded rings as big as Dio Lewis's lignum-vitæ ones; but the principle of those ugly and forgotten decorations was good and will not be forgotten.

Whenever the weaver's art shall become again a fine art, weaving of curtains will be one of the great opportunities for the display of power of design. These will be of simply woven stuff more generally than dress-materials, which, when costly, will be much overlaid and modified by embroidery; and, on the other hand, much richer patterns can be made, and in much richer materials than in the case of carpets. Different uses for curtains call for different characters in the design. Some are to be large and rather straggling, formal vines with large conventionalized flowers; some are to be uniform diaper patterns, the figures of the diaper having animals and birds in them alternating with purely conventional forms; some are to be mere stripes. Just at present, with our small resources in the way of woven stuffs, we have reason to be glad of the "curtain reps" that the upholsterers offer us—marroons and browns, with broad borders made up of numerous narrow bands of brilliant colors. Some of these are really excellent in their rather humble way, and deserve better rooms than those they will help to make endurable. But they are too often put up with the stripes vertical; whereas, when a curtain is long in proportion to its width, it is almost essential that it should have a border along the bottom. The colors of this border may be, and generally should be, repeated by a narrow band near and just above it, and again by a band near the top, all horizontal. This arrangement of parts is so important to most curtains that, even if a housekeeper should have curtain material as splendid as an India shawl, the curtain should, like the shawl, have its border well defined.

Nowadays, if anybody wants a beautiful curtain it must be embroidered. Of curtains so made there are occasionally splendid ones to be seen, but no more can be said of them now and here.

GOOD MANNERS.

THE standard of manners changes from generation to generation. Sir Roger de Coverley or Sir Charles Grandison is not the type of the gentleman of the present day. But though the standard varies, the best of good manners is unchanging, for it is derived from the moral principles of human conduct. Bad manners indicate ill morals, good manners are the expression of good morals, and the best manners are those of the best men. The old dramatist, Thomas Decker, goes to the heart of the matter when he speaks of our Saviour as

> "The first true gentleman that ever breath'd."

So, too, Charles Lamb, in his tender and delightful account of Joseph Paice, of Bread-street Hill, gives the picture of a truly well-mannered man. "Though bred a Presbyterian, and brought up a merchant, he was the finest gentleman of his time. He had not *one* system of attention to females in the drawing-room, and *another* in the shop or at the stall. I do not mean that he made no distinction. But he never lost sight of sex, or overlooked it in the casualties of a disadvantageous situation. I have seen him stand bare-headed—smile, if you please—to a poor servant girl, while she has been enquiring of him the way to some street, in such a posture of unforced civility as neither to embarrass her in the acceptance nor himself in the offer of it. He was no dangler, in the common acceptation of the word, after women; but he reverenced and upheld, in every form in which it came before him, *womanhood*. I have seen him—nay, smile not—tenderly escorting a market-woman whom he had encountered in a shower, exalting his umbrella over her poor basket of fruit, that it might receive no damage, with as much carefulness as if she had been a countess."

Such manners as those of Joseph Paice are not often seen in our streets, our horse-cars, or other public places, and yet we are apt to boast that women are nowhere treated with more courtesy and consideration than throughout America. Some twenty-five or thirty years ago, when the late venerable Josiah Quincy was president of Harvard College, he was going one rainy evening from Boston to Cambridge in the omnibus. At the bridge the omnibus stopped and a poor black woman with a heavy basket got in. There was no seat for her, and no one of the young men in the omnibus offered her his place. Mr. Quincy rose, and, with the quietest politeness, said to the woman, "Madam, be good enough to take this seat," and he took his place outside the door upon the steps of the vehicle. The act was characteristic of the man.

Yet although morals is the best of good manners, and the good man is certain to have manners essentially good, there is an art of manners which he may not possess. The art is the result of long culture of what is called good breeding, and in some cases it may be carried so far that the well-bred man, even if not a good man, may possess all the externals of good manners. But the art, unless associated with excellence of character, is unreliable. It will not stand against passion; it is apt to be a disguise of selfishness. "Scratch a Russian," said Napoleon, "and you will find a Tartar."

The value of the art of manners is that it helps to the attainment and security of that upon which good manners rest, namely, self-reliance. The good man is naturally self-reliant, for he knows that his poise is not to be readily disturbed; he is, therefore, at ease, and he sets others at ease. The aim of good manners is to make people happy, to set them at their ease, to enable them to be at their best with each other. Whatever interferes with this is bad manners, and the whole art of manners is ideally directed to this end. "Manners," says Mr. Emerson, "are the happy way of doing things."

Many false notions still prevail about manners, derived mainly from the feudal conditions of European society, in which, men being divided into classes, there were introduced many factitious and conventional relations, a due regard for which constituted a large part of the manners of courts and of society. The traditions of the past in regard to manners, as in regard to other arts, are not to be held in too high respect. In our country, where the relations of men are simple, natural, and humane, we must revise the old codes of manners. Those codes were part of the laws by which the false distinctions among men were maintained. An aristocracy finds its securest defence and safeguard in its superior manners. The plebeian may get riches, the tradesman's son may be wiser than the lord's, the manufacturer may get estate and title, but the aristocracy still possesses exclusively its manners, the inheritance of five hundred years. The aristocratic manner goes with the blue blood. It is the element that changes least in aristocratic power.

But in our society the only conventionalisms in manners which are important and require to be preserved are those which long experience has shown to be requisite or desirable as aiding to place men in equal relations with each other in a mixed society. In a family, conventionalisms and factitious manners mainly disappear because in domestic intimacy each one knows the others thoroughly, and the relations of all are determined by affection. But in society men meet on different terms, ignorant often of each other's special tastes, foibles, inclinations, and capacities, and conventionalisms in manners serve to bring all the company upon a common level, to set each man at ease with his neighbor, and to prevent each from giving unwitting offence. It is a part of good morals to make one's self familiar with these conventionalisms. It is of the nature of a duty to society and to ourselves. It is selfishness to neglect them.

But the tendency of American life is not altogether favorable as yet to the production and general cultivation of good manners. So far as the relations between man and man are truer, simpler, more confiding, and more humane than they have been or are elsewhere in the world, we may hope, we have the right, indeed, to believe, that the manners of men will constantly improve; that they will be simpler, more considerate, more conformed to the absolute test of morals than the manners of other peoples. We think we already see a great advance; we have got rid of the faults that spring from the existence of an upper and lower class, of arrogance, pride, servility, flunkyism as embodied in conventional manners. But, on the other hand, the loose organization of our society, the sturdy individualism which it has developed, the absence of any social stability, the low standard for the most part of the cultivation of our most cultivated people, the rude life and habits of backwoodsmen, emigrants, and frontiersmen, which react upon our most civilized and refined classes; the immense flood of half-barbarian foreigners who draw together in degraded masses in our cities—these are among the circumstances which combine to affect ill our manners as a nation. Slavery also was a constant element in degrading the tone of manners; and the Southern gentleman, who was the theme and admiration of our Northern flunkies, was a type of that class which makes clean the outside of the cup and the platter but whose inward part is full of wickedness. The manners of a Southern man rarely gave assurance of that self-control without which manners are a mere pretence.

Mr. Lincoln possessed the essentials of good manners. He showed us what manners an American "railsplitter" might have. They were the manners of a good heart, that trusted itself and other men. Upon such a foundation we may build whatever superstructure of beauty, grace, and art we choose. And though our manners be uncouth and unconventional to-day, they shall to-morrow—a hundred years hence—be the noble manners of men not only gentle in heart but of refined and elegant cultivation.

BOOKS OF THE DAY.

Title and Author.	Publisher or Bookseller.	Reference to Review, Notice, or Advertisement in The Nation and Descriptive Notes.	Price.
Book of Roses. Francis Parkman.	J. E. Tilton & Co.	Adv. p. 539. Horticul.	$3 00

JUST PUBLISHED,

CHERRY AND VIOLET;

A Tale of the Great Plague.

By the Author of "Mary Powell," etc.

On tinted paper, bevelled boards, red edges, on gilt top, $1 75.

The first edition of this charming book was exhausted within a week of its publication.

A NEW EDITION NOW READY.

"This beautiful story of domestic affection, suffering, and self-sacrificing fidelity, will be read by old and young with eager attention and pleasure."—*Ch. Intelligencer.*

"This is a delightful story, full of delicate touches, and one which those who have read the author's 'Household of Sir Thomas More' and 'Mary Powell' will hasten to buy."—*Boston Commercial.*

"A fascinating story. In its style it bears a strong resemblance to the Schönberg-Cotta Family. Its religious teaching is excellent and it has a decided merit as a picture of social and political life in England two hundred years ago."—*Am. Presbyterian.*

"Cherry and Violet is one of the most charming stories we have read in many a day."—*N. Y. Evangelist.*

"No more perfect reproduction of an event in past times has been given, and the profound touches of character make it a record of human nature for all times."—*New Yorker.*

M. W. DODD, Publisher,

506 Broadway, New York.

Just Published.

THE GIANT CITIES OF BASHAN; AND SYRIA'S HOLY PLACES. By Rev. A. L. Porter, author of "Murray's Hand-Book to Syria and Palestine." Handsomely illustrated, post 8vo, bevelled boards, laid paper, pp. 377, price $3.

"The volume before us is strikingly original in its cast. It pushes investigation into hitherto unexplored regions. Avoiding famil ar localities, the author visited places seldom, some of them never before, trodden by European travellers."—*Hours at Home.*

"The more familiar places of Palestine Mr. Porter passes over, and opens up new discoveries of regions seldom if ever visited. The whole volume is exceedingly engaging, while his personal inspection and description of the desolated cities of Bashan, the cities of giants, cannot fail to rivet the attention of the reader."—*Presbyterian.*

ALSO,

A NUTSHELL OF KNOWLEDGE. By A. L. O. E. One illustration. 18mo, muslin, price 90 cents.

RESCUED FROM EGYPT. By A. L. O. E. Illustrated. 12mo, muslin, price $1 50.

The above can be had at the respectable booksellers, or will be mailed free on receipt of price by the publishers.

THOMAS NELSON & SONS,

137 Grand Street, New York.

The Series will be completed in 30 volumes.

The publishers will send any of the above works, post-paid, on receipt of the price.

SIX INTERESTING NOVELS.

I. MISS OONA McQUARRIE.

A Sequel to "Alfred Hagart's Household."

BY ALEXANDER SMITH,

Author of "A Life Drama," "A Summer in Skye," etc. 1 vol. 16mo. $1.

"A sweeter story we have not read this many a day. Simple in the telling, but full of imagery, it touches the heart and delights the fancy."—*Indianapolis Journal*.

II. LUCY ARLYN.

BY J. T. TROWBRIDGE,

Author of "Neighbor Jackwood," "Coupon Bonds," etc. 1 vol. 12mo. $2 25.

"This is a sensational novel, but of a high order of excellence. The author has wrought his story from actual facts. The characters are life-like, and the story, now strangely comic and then darkly tragic, is finely wrought."—*New Bedford Mercury*.

III. ST. MARTIN'S SUMMER.

BY ANNE H. M. BREWSTER,

Author of "Compensation." 1 vol. 16mo. $2 25.

"This volume is the creation of a peculiarly refined and cultivated mind, and belongs to the first order of purely literary productions. . . . One of the most original and enjoyable books of the season."—*Roxbury Journal*.

IV. HONOR MAY.

1 vol. 16mo. $2.

"The writer seems to have succeeded in producing a musical novel of the best class. It is a book which will bear twice reading."—*Hartford Courant*.

V. LEIGHTON COURT.

A COUNTRY-HOUSE STORY.

BY HENRY KINGSLEY,

Author of "Ravenshoe," "The Hillyars and the Burtons," etc. 1 vol. 16mo. $1 50.

"This is, on the whole, a charming story. . . . The style is wonderfully fresh and vigorous, the plot is ingenious and interesting, and the characters are drawn with a sharpness of outline and a dramatic discrimination that show the hand of a master, and the landscape-painting is as fine as only Mr. Kingsley could have made it."—*Boston Advertiser*.

VI. ASPHODEL.

AN AMERICAN STORY.

1 vol. 16mo. $1 50.

The author has a poet's nature, and there is remarkable grace, beauty, and refinement in its conception, the sketching and development of character, and the many gems of thought and expression in which it abounds.

*** Any of these books sent, *post-paid*, on receipt of price.

TICKNOR & FIELDS,

Publishers, Boston.

"*Why are we not animals?*"—See first page "Round Table," April 28, 1866.

REDFIELD'S COMPARATIVE PHYSIOGNOMY.

ILLUSTRATED BY 330 DRAWINGS SHOWING RESEMBLANCES BETWEEN MEN AND ANIMALS.

1 vol. 8vo. Price $3 00.

"Physiognomy is available on all occasions, and it is even a breach of etiquette no to look a man in the face."—*Extract from Preface*.

"With his hand thus o'er his brow,
He falls to such perusal of my face
As he would draw it."

Publisher and Importer of Scientific Works,
192 Broadway, New York.

FINANCIAL REVIEW.

NATION OFFICE, Thursday Evening,
May 3, 1866.

GOLD and exchange have again advanced since we last wrote. Gold has been as high as 128, closing this afternoon at 127⅞. Exchange closed at 109¼ for yesterday's steamer; some sales were made as high as 109½, and many look for an advance to the specie-shipping point unless cotton should decline here or advance abroad, or unless a new enquiry should spring up in Europe for 5-20 bonds. General business is dull, but the ease of money prevents goods being sacrificed.

Money continues to rule at 5 per cent. on call. First-class paper is current at 6 to 7. The decision of the Secretary of the Treasury to receive no more money on call will have the effect of further glutting the market, and very low rates of interest must be expected until general business becomes much more active than it is, or until the Secretary undertakes to fund the interest-bearing legal tender. Senator Sherman, on the 2d, introduced into Congress a bill authorizing a consolidated loan of the United States, in thirty-year 5 per cent. bonds, not to be negotiated under par. The measure is generally approved and will probably pass.

Much sensation has been caused by the development of the Ross frauds. John Ross, a gold and stock broker, on the 1st inst., forged certifications to his own checks for large amounts and obtained a quantity of gold, with which he absconded. He also forged bonds and borrowed on them. It is not yet known how much he stole or what has become of him.

The following table will show the course of the stock, gold, exchange, and money markets since our last issue:

	April 21.	April 30.	May 3.	Advance.	Decline.
United States Sixes of 1881	106	108	108¼	¼	....
5-20 Bonds, old	104⅞	105⅞	101⅞ ex.c	....	...
5-20 Bonds of 1865	104¾	105⅞	101⅞ ex.c	....	....
10-40 Bonds	93⅜	95	95¼	¼	....
7.30 Notes, second series	101⅞	101⅞	101⅞	....	....
New York Central	93	92⅝	9⅜	....	⅜
Erie Railway	73½	73¼	73½	¼	....
Hudson River	109	110¼	110½	¼	....
Reading Railroad	104	105¾	106¾	1	....

	April 21.	April 30.	May 3.	Advance.	Decline.
Michigan Southern	82⅛	78¾	78	....	¾
Cleveland and Pittsburgh	81¼	81	81¼	¼	....
Chicago and North-western	26⅞	28⅝	28¼	....	⅜
" " " Preferred	57¾	58¾	58½	....	¼
Chicago and Rock Island	121½	123¾	123¾	1	....
P., Fort Wayne, and Chicago	97⅛	98⅝	98⅞	¼	....
Canton	52½	56	59½	3½	....
Cumberland	44⅛	45	44¼	....	¼
Mariposa	11½	12½	12¾	....	¼
American Gold	126¾	126½	127⅛	1⅜	....
Bankers' Bills on London	107¾	108¼	109¼	1	....
Call Loans	5	5	5	....	....

The stock market has been rather dull for the past day or two. One or two of the clique stocks have advanced. Reading has sold as high as 107; Pittsburgh at 82½, and Illinois Central at 122. No specific cause has been assigned for the advance, which is simply due to the cliques moving the stocks up by fresh purchases in the idea that they are thus making money Erie and Central are steady without much animation. There is a large short interest in both, but the earnings are falling off so fast that even the boldest bulls do not care to corner them. Governments have been active, chiefly on seller's option, large lots having been sold to arrive.

The annual report of the Erie Railway Company for the year 1865 has at length made its appearance. It is full of instruction. The business of the year 1865 compares as follows with that of 1864:

	1864.	1865.	Increase.
Gross earnings	13,429,643	15,434,774	2,005,131
Expenses	8,961,285	10,368,264	1,406,978
Net earnings	4,468,358	5,066,510	598,152

It would thus appear that expenses increase so much faster than earnings that an increase of over $2,000,000 in traffic ensured only about $598,000 increase in profits. But we must turn to page nine of the report before we make too sure how much the profits really were. On that page the directors state that they expended in the year 1865 $4,941,293 in "construction," to wit: in new locomotives and cars, new side-track, shops, depots, bridges, engine-houses, etc. As the facts actually stand, therefore, the business of 1865 was as follows:

Gross receipts		$15,434,774
Operating expenses	10,368,264	
Construction	4,941,293	
		15,309,557
Net profits for the year		125,217

out of which the company had to pay interest on bonds, rents, taxes, and dividends, amounting in all to a trifle over $5,000,000. This, of course, could not be done. Having spent in construction nearly all the money earned, the directors were forced to borrow in order to pay interest, taxes, rents, and dividends, and they did accordingly borrow as follows:

On sterling bonds	$3,816,582
On fourth mortgage bonds	900,000
On Long Dock bonds	619,055
Total	$5,335,637

If this were the first year during which the company had to borrow money to pay interest on its bonds, rents, taxes, and dividends, the anomaly might be susceptible of explanation; but, on referring to the report made a year ago, we find that in the year 1864 the company borrowed as follows:

On fifth mortgage bonds	$737,000
On Buffalo branch bonds	13,600
On long dock bonds	469,000
On construction stock	2,200,000
Total	$3,419,600

In that year the interest on bonds, rents, taxes, and dividends amounted to $4,458,042, toward which sum it thus appears that the earnings of the road only contributed about a million. Not only, therefore, have the dividends been borrowed for two years, but most of the money paid for interest on bonds, taxes, and rents. The following table tells the story:

Years.	Dividends Paid.	Money Borrowed.
1864	$1,460,102	$3,419,600
1865	1,813,282	5,335,637
Total	$3,273,384	$8,[illegible]237

When the company was taken out of the hands of the receiver on 1st January, 1862, its cost stood at $40,104,700; it now stands at $47,476,782 (exclusive of floating debt); increase in four years, $7,372,082, considerably more than the aggregate sum paid in the shape of dividends.

The answer of the directors to these startling figures is very simple. They say that the road is not finished, and never will be; that the money borrowed in 1864 and 1865 was used to increase the capacity and property of the road, and that it (the road) is just so much the more valuable by the said expenditure; that they see no reason why they should not go on borrowing money to lay a new track and increase their capacity for doing business, though at the same time they are paying dividends out of earnings. This line of argument raises the vexed question as to what constitutes construction proper, and what repairs. Allowing that the directors are right in their theory, that there is nothing inconsistent in the simultaneous borrowing of money for construction and the payment of dividends to stockholders, it is clear that no such dividends could be justified if the money borrowed was to keep the road in repair, or to replace worn-out locomotives and cars, or to rebuild station and freight houses falling into ruin. This is precisely the difficulty with the Erie Company. Of the expenditure under the head of construction during the year 1864 only about a million was for new track and new buildings, while nearly $2,500,000 was for cars, locomotives, sheds, depots, and the like, and ought to have been charged to repairs. Of the $4,941,293 spent for "construction" in 1865 only about $819,000 was for new track, and perhaps $250,000 for absolutely new works. The rest was for new locomotives and cars, depot and freight buildings, bridges, shops, etc., and clearly should have been, in part at all events, if not wholly, charged to repairs. A road which cannot earn enough money to keep its buildings in repair and to replace worn-out cars by new ones, or to add new cars and locomotives from time to time as they may be required, certainly should not pay dividends.

It is now understood that the floating debt of the Erie is nearly $4,000,000, and that the company has no means of paying this debt except by the sale of more stock at par. Under the circumstances it is difficult to perceive upon what grounds the directors "anticipate most satisfactory results from the operations of the road." It would be more natural to anticipate, first, a suspension of dividends, which is inevitable; and secondly, whenever the money market becomes active, so that the Erie acceptances now afloat can no longer be negotiated, new suits by angry creditors, new judgments, and probably, after a long agony, a second lapse into the hands of a receiver.

NEW FEATURES—NEW TABLES,

By which all Policies are NON-FORFEITING and ENDOWMENT, payable at about the same cost as ordinary Life and Ten-Payment Policies payable at death only. We call special attention to these Tables as exceedingly attractive and ORIGINAL with the UNION. In case payments are discontinued, after two premiums have been paid, the Company contract to pay, AT DEATH or the SPECIFIED AGE, an amount in proportion to the number of premiums paid.

The Percentage system of Dividends used by this Company affords greater protection to the family than any other plan, as in event of an early death the amount of policy paid is twice that paid by all cash Companies with the same cash outlay of premiums.

The greatest possible liberality in assisting parties to keep their Policies in force.

Liberality and promptitude in the settlement of claims.

We refer to the Massachusetts and New York Insurance Commissioners' Reports for 1864 and 1865 as an evidence of the Safety, Reliability, and Unparalleled Success o the Union Mutual.

J. W. & H. JUDD, GENERAL AGENTS.

9, 11, and 13 Mercer Street, New York.

☞ Special attention paid to the fitting up of hotels, halls, and private residences, etc., etc.

PARLOR AND CHURCH ORGANS AND MELODEONS.

MESSRS. CARHART & NEEDHAM, established in 1846, are the oldest manufacturers of the improved Reed instruments in the United States, Mr Carhart being the inventor and patentee of all the essential improvements which have been made in these instruments up to the present date.

They have been established over twenty years, during which period they have manufactured a vast number of instruments of all classes; and wherever they have been exhibited in competition with the instruments of other makers, they have invariably taken the highest premium.

THE LAST TRIUMPH OF CARHART & NEEDHAM.

At the Fair of the American Institute held in New York in 1865 CARHART & NEEDHAM received the SPECIAL GOLD MEDAL over all the other instruments placed there in competition. The judges were Dr. Wm. Berge, C. B. Seymour (critic of the New York *Times*), Thomas Appleton, celebrated organ builder of Boston, George Jardine, also a well-known organ builder, and Dr. E. Ringer, an expert in the business.

EXTRACTS FROM THE SEVERAL REPORTS OF THE JUDGES.

From Report of Dr. Wm. Berge.

"The quality of the tone is the best I have ever heard, and the number of stops surpassed my expectations. The delicacy of *touch* and the quickness of *speech* are remarkable. In fine, I consider the Parlor Organ of Messrs. CARHART & NEEDHAM to be the best on exhibition, and therefore entitled to the highest award of the Institute."

From the Report of C. B. Seymour.

"The undersigned thinks it proper to suggest that CARHART & NEEDHAM should receive a Special First Premium for their large Parlor Organ."

From Report of Thomas Appleton.

"No. 526 is the best for the following reasons: 1st. It contains more reeds and of greater variety than any other. 2d. The reeds are placed above the key-board, thereby allowing a greater volume of sound to be heard. 3d. The successful application of the swell, which makes this instrument resemble the church organ more nearly than any previous arrangement. 4th. The voicing of the reeds is remarkable, and in the smoothness and quality of tone they resemble pipes more than reeds. The instrument is undoubtedly superior to any ever before constructed with reeds."

From Report of George Jardine.

"To the honor and credit of the United States of America a native American citizen is the first in the world who has discovered and demonstrated that not only can these vibrating tongues or reeds descend lower in the base, but of the very finest quality of tone, rich, round, and full, of quick articulation and free from *windiness*, right down to the 32 feet tone of C C C C. No doubt the fame of these gentlemen and their discovery will very soon and deservedly be circulated among the makers of Reed Organs in the world."

From Report of Dr. Ringer.

"No 526 is the best for the following reasons: For its superior softness, evenness, and power of tone, being less reedy than in any instrument I have examined. 2d. For the great number of keys of different character of tone, which give the player an almost infinite variety of combinations."

THE GOLD MEDAL.

From Watson's Weekly *Art Journal*.

"AWARDS TO MUSICAL INSTRUMENTS.—A gold medal was awarded at the late Fair of the American Institute to CARHART & NEEDHAM for the best reed instrument on exhibition—a very just testimonial."

"They are an exceedingly good substitute for an organ, and I can speak of them in the highest terms." —GEO. W. MORGAN.

"I have found them to be the *finest instruments of the class I ever saw.*"—GEO. F. BRISTOW.

"They are entitled to be ranked as the *first* and *best* among instruments of their class."—WM. A. KING.

"*The tone is incomparable*, and they are *far in advance* of any other instrument of a similar kind."—CHARLES FRADEL.

CARHART & NEEDHAM

manufacture and are prepared to export Reed Organs of all classes for Parlors, Lodge-rooms, and Churches.

Price List and Illustrated Catalogue sent free.

STEINWAY & SONS'

GRAND, SQUARE, AND UPRIGHT PIANO-FORTES

Have taken Thirty-two First Premiums, Gold and Silver Medals, at the Principal Fairs held in this country within the last ten years, and in addition thereto they were awarded a First Prize Medal at the Great International Exhibition in London, 1862, in competition with 259 Pianos from all parts of the World.

That the great superiority of these instruments is now universally conceded is abundantly proven by the FACT that Messrs. Steinways' "scales, improvements, and peculiarities of construction" have been copied by the great majority of the manufacturers of both hemispheres (AS CLOSELY AS COULD BE DONE WITHOUT INFRINGEMENT OF PATENT RIGHTS) and that their instruments are used by the most eminent pianists of Europe and America, who prefer them for their own public and private use, whenever accessible.

STEINWAY & SONS direct special attention to their

PATENT AGRAFFE ARRANGEMENT,

which, having been practically tested in all their grand and highest-priced Square Pianos, and admitted to be one of the greatest improvements of modern times, will hereafter be introduced in EVERY PIANO MANUFACTURED BY THEM WITHOUT INCREASE OF COST to the purchaser, in order that ALL their patrons may reap its benefits.

STEINWAY & SONS' PIANOS are the only American instruments exported to Europe in large numbers, and used in European concert-rooms.

WAREROOMS, 71 & 73 EAST FOURTEENTH ST., between Union Square and Irving Place, New York.

Topics of the Day.

The wholesome tyranny of our Board of Health has found expression in a most comprehensive code of ordinances. Too comprehensive to be very effective some of them seem, as, for example, where it is commanded that "no person shall carelessly or negligently do, or advise, or contribute to the doing of any act or thing dangerous to the life or detrimental to the health of any human being;" an injunction which opens to persons of tender consciences and lawyers a very fine field for casuistry. Every owner, or lessee, or tenant of a house, within the sanitary district; every shipmaster, every trader, physician, policeman—in short, every natural and every artificial person, from the manufacturing corporation down to the man that shakes carpets—will find some strict order laid upon him, and is required in general to take notice of the one hundred and sixty-four ordinances and obey them all. The one hundred and sixty-fifth requires him to obey any that may be made hereafter. There have been but two well-authenticated cases of cholera as yet, and but one that proved fatal.

Mr. Deming, of Connecticut, delivered in the House on Thursday a speech on the bill creating the grade of general in the United States army—one of those speeches which make Congress and the country ridiculous. He cited as precedents for the promotion of General Grant to the newly created dignity Sesostris, Rameses, Pharaoh, and several unmentioned Babylonian and Assyrian chiefs. He was "down on" the Trojan war, but of course did not deign to call it by so simple a name. In his more noble language, it was the war "which, for two centuries, raged round mighty Ilium." Most of the discourse was of a piece with this; and when one thinks that the orator was uttering the voice of the House upon one of the most inspiring themes of the century, one cannot help asking solemnly, whether nothing can be done to improve Congressional rhetoric.

A grand dinner in honor of the Confederate dead, and of "Admiral" Semmes, was recently held in Mobile, at which the first toast was "The Day we Celebrate;" the second, "The President of the United States," which was received with roars of applause. The third was "Jefferson Davis;" and "tigers" were given for the hero of the "glorious Alabama," who, as a reward for his services in destroying American merchant vessels, is to be elected probate judge. All this is bad and irritating, no doubt, but we see no help for it. In our opinion, the best way to extinguish the feelings which prompt demonstrations of this kind, is to let them have vent. The other plan has been tried in various European countries, and has failed.

The probable occasion of the three days' riot at Memphis seems to have been a chance collision in the street between a white and colored driver. The cause of the atrocities that ensued when the immediate excitement was over, and everybody thought that order had been restored, was of course the hatred, bequeathed by slavery, of a despised and hitherto helpless race. This directed the incendiary to the negro quarter of the town, where, if any culpable resided, also dwelt a large and innocent population of both sexes. It is noteworthy, too, that the torch was applied not only to their habitations, but to their churches and school-houses, of which, says a despatch, eight were burned—in a spirit, we may add, akin to that which destroyed the colored orphan asylum of this city in 1863. Gen. Stoneman has taken control of Memphis and superseded the civil authorities.

The consolidation of the British North American provinces appears to be now quite certain, and this result of its influence, not to say its too active interference, in colonial affairs, the home Government will no doubt view with great satisfaction. Now that our neighbors are to be confederated, and while the fishery question awaits settlement, perhaps we may hear something further of a proposal which was first made nearly a year ago in the New York Chamber of Commerce, and which attracted some attention in England. It was suggested that England and the United States should declare the new federation neutral territory. This would be a very good thing for England and a very good thing indeed for British America. The young nation could proceed to grow and develop itself undisturbed by any fear; except, perhaps, the fear of not being able to preserve its neutrality along the Canadian border. The loser by such an arrangement would be the United States, which, in parting with the right to make war in Canada, would lose we will not say the surest guarantee, but certainly a valuable guarantee, that England will not lightly disturb the peace between herself and us.

Earl Russell, in a letter to Mr. Adams, denies Mr. George Bancroft's assertion that he, as "the British Secretary of State for Foreign Affairs, made haste to send word through the palaces of Europe that the great republic was in its agony," etc., and calls Mr. Bancroft's attention "to some facts of a totally opposite character." In a debate in the House of Commons, occurring in the end of May, 1861, he declared, replying to some member who said it had, "that the republican bubble had not burst." Whereupon Mr. Bancroft proves that in the first week of May the secretary, without waiting for official information from Lord Lyons, recognized the confederacy as a belligerent, spoke of the Union as "the late Union," and wrote Earl Cowley in Paris to that effect. This was being in haste, and, substantially, was doing what Mr. Bancroft charges; so the historian, or rather the orator, seems to us to have the best of the argument. Mr. Bancroft takes occasion to put in a defence of his speech against the accusation that it was grossly impolite to the representatives of foreign nations. In our opinion he relieves it of the weight of that charge, although he is not so successful in justifying himself for dwelling at such length upon the conduct of France and England when he was undertaking to speak of the life, death, and services of Abraham Lincoln. When he made his speech the main business of the day was to speak to Americans about their President. The presence of the foreign ambassadors was a mere incident of the occasion, and even at that an incident unforeseen by the orator.

The last news from the European continent, though pacific in its main features, is not apt to dispel all apprehensions of a great war. It is true we receive the positive report that Prussia has agreed to Aus

tria's proposition for a mutual disarmament, and we also hear that the minor States of the Germanic Confederation have come to an understanding to accept the Prussian proposal, regarding the convocation of a general parliament as a starting point for a reform of the federal compact of Germany. But the arrangement between the two great German powers for the re-establishment of peaceful relations seems to have been made with great verbal and mental reservations, as on one side we hear Count Bismark, in his reply to an address for peace, still speak of war possibly becoming a necessity, in spite of the King's desire to avoid it; and on the other, see Austria continue her armaments, in a highly menacing way, in her southern provinces, under the pretext that a warlike attitude there was made necessary by the concentration, on the part of Italy, of considerable bodies of troops in the vicinity of Bologna. And, according to the latest advices, Prussia objects to disarming her forces as long as Austria is determined to keep her own on a war footing in any part of the empire. Nor do we hear of any approaching solution of the vexed Schleswig-Holstein question which has led to all these threatening complications, which, however, must be definitively solved if peace in Germany is to be regarded as secured.

As was expected, the Turkish Government protests against the election in Moldo-Wallachia which calls Prince Charles of Hohenzollern to the throne of that semi-independent country. A Rouman deputation has, in the meanwhile, left Bucharest for Berlin to tender the hospodarship to the elected prince.

The telegraphic summary of the *China's* news from Halifax announces that the English reform bill has passed the House of Commons by a majority of five. This undoubtedly means that it has passed the second reading only, and the smallness of the majority makes it certain that it will be killed in the committee, if the ministry push it so far. The result will probably be a dissolution of Parliament, unless the prospects of a coalition ministry should be sufficiently good, as far as Mr. Gladstone is concerned, to induce him to save his friends the expense of re-election. The two causes which have most contributed to the failure of the measure have been the apathy of the working classes and the determined hostility of the "thinking Liberals," represented by the *Spectator*, who dread such a preponderance of the working-men's interest in the House of Commons, in case the bill were passed without a careful re-distribution of seats, as would simply substitute another class government for that already existing.

The Pope has elevated the *Civiltà Cattolica*—a Jesuit newspaper, and once published in Naples, but expelled from that city owing to its being too strong even for King Ferdinand—to the position of the authorized exponent and defender of the Catholic faith. Its editors are to form a separate college at Rome, and its leading writers are, of course, to have a character of *quasi* infallibility. The event has created a great sensation in the Roman theological world, as it indicates that the Pope has thrown himself into the arms of the Jesuits, and that the old orthodox Catholics, represented by the Belgian University of Louvain, are ousted. It has a literary significance, too, which is worthy of note, as it is the most considerable tribute ever paid, considering the quarter from which it comes, to the growing power of the periodical press. That the Pope should pronounce the contents of a book pure truth, to be swallowed unhesitatingly by the faithful, is natural enough; but that a newspaper should furnish thousands of subscribers every month with columns of rhetoric, under a standing certificate from the Vatican that they are to be taken as the utterances of the vicegerent of God upon earth, is verily something both new and startling. No higher compliment was ever paid to "the press," in the modern sense of the word. Nevertheless, there is something strange and grotesque in the spectacle. It is like Lancelot of the Lake or Amadis de Gaul working a Parrot gun in complete armor. The man who made the attempt upon the life of the Czar, who was first represented as a revengeful Pole, and subsequently as a disaffected Russian nobleman, is now said to be a hypochondriac of the government of Saratov (not "Laratof"), in the interior of Russia.

CONGRESS.

WASHINGTON, May 5, 1866.

The present temper of Congress is not that of a general acquiescence in the plan reported by the Joint Committee of Fifteen. On the contrary, the rather complex scheme of constitutional amendment proposed has few really hearty friends in either House. The old enthusiasm and spirit of unity which carried through the civil rights bill after the presidential veto does not exist upon this new issue. It is felt that a more simple platform, such as "the plain people" (as Mr. Lincoln loved to call them) can understand at a glance, is needed. Perhaps the plan proposed is the best that could be arrived at, as the result of compromise among widely divergent views; but its disadvantages are seriously felt as a practical political issue. If adopted, it will only be from fear of doing worse, and an unwillingness to dissolve Congress and go to the people without some tangible scheme of a restoration of the whole Union.

The admission of Colorado as a State has been the feature of the week. It is acknowledged that the revival of this plan of admitting the baby commonwealth, defeated early in the session in the Senate, was brought about in great measure by the wish to render the two-thirds majority in that body impregnable. A presidential veto may defeat this, since the vote for admission was less than two-thirds in both branches.

DIARY.

May 2, 1866.—In the Senate, Mr. Sherman offered a bill for funding the national debt at an interest of 5 per cent. Mr. Williams offered an amendment to the bill of the Reconstruction Committee for restoring the rebel States to political rights, providing that senators and representatives shall be received after March 4, 1867, from any State which has previously ratified the proposed constitutional amendments; and that Tennessee and Arkansas shall be admitted without delay upon such ratification. The post-office appropriation bill was passed after the Senate had adopted—yeas, 19; nays, 11—an amendment withholding salary from officers appointed to vacancies created by the President's removal without the consent of the Senate.

In the House, the army bill was put upon its passage and lost—yeas, 36; nays, 83.

May 3.—In the Senate, a bill to pay the State of West Virginia $368,000 for expenses in aid of the United States during the war was passed. The post-office appropriation bill was recalled from the House of Representatives, and a motion to reconsider the amendment relating to removal of officers was entered.

In the House, a bill to annex 18,000 square miles of the territory of Utah to the State of Nevada was passed. The Senate bill for admission to the Union of Colorado was taken up. Mr. Washburne, of Ill., moved an amendment that the admission should not take effect until the State should strike out from its constitution the word "white" as a qualification of voting. Lost—yeas, 37; nays, 95. The bill admitting Colorado was then passed—yeas, 80; nays, 55. The Senate bill extending the time for completing the Eastern division of the Union Pacific RR. was passed, with an amendment extending for two years the time for commencing and completing the Northern Pacific RR.

May 4.—The Senate spent the day on private bills.

In the House, a resolution congratulating the Emperor of Russia and the twenty million serfs upon his providential escape from assassination was passed unanimously—yeas, 124; nays, 0. The bill to revive the grade of general in the army of the U. S. was passed—yeas, 116; nays, 11.

May 5.—The Senate was not in session.

In the House, speeches on the state of the Union were made by Messrs. Phelps, Bundy, Ingersoll, Rogers, and Randall, of Pa.

THE FREEDMEN.

Reports from sixteen sub-districts in South Carolina show a decided change for the better in the condition of the freed people, and some improvement is visible even in the Edgefield district, which is still harassed by outlaws. Reports from North Carolina and Texas represent the freedmen to be industriously at work and prospering. At Houston, the planters employ runners to find hands for them, at the rate of from $3 to $12 for each hand secured, and these agents are frequently despatched to other States to induce emigration to Texas.

At Augusta, Ga., the colored people, accompanied by some whites, had proceeded to the city cemetery for the purpose of decking the graves of the Union dead (white) with flowers, when they were met by the mayor and a squad of police, who forbade them to enter. The matter was finally compromised by the mayor permitting those who had flowers to enter; but as a general rush was made as soon as the gates were opened, they were again closed, and everybody was excluded.

Notes.

LITERARY.

Mr. G. H. Lewes has lately published, in "The Fortnightly Review," a paper on Baruch Despinosa, or Benedictus de Spinosa, as he called himself after the scholarly fashion of his time—that much maligned Hebrew philosopher whom the godly Malebranche pronounced "a wretch," the sceptical Bayle "a systematic atheist," the pious Schleiermacher "a saint," and Novalis "a God-intoxicated man." The subject is not a new one, Mr. Lewes himself having written upon it over twenty years ago in "The Westminster Review"—his article, by the way, being the first attempt to vindicate Spinosa in England—but it has all the charms which freshness and vigor of treatment can impart to it, and the merit of presenting the chief facts of Spinosa's life briefly and interestingly. From the philosophy of Spinosa Mr. Lewes entirely dissents, confessing that many of his conclusions are such as must shock all Christians and most Theists, and that to him even more than to Kant should be applied the epithet of "all-shattering" (*alles zermalmende*). "The horror which many feel at his opinions," he thinks, however, "is entirely due to the rooted prejudice that morality is inseparable from certain special dogmas which, if rejected, leave the man a prey to all animal and ignoble passions. But no one was more rigorous than he in the subjection of all passions and all egoisms to the love of God and the Divine will. The love of God is everywhere proclaimed the highest good, the noblest aim, the only source of permanent felicity. And when Isaac Orobio accused him of getting rid of all religion in the escape from superstition, he gravely asked, 'Is it to cast off religion to acknowledge God as the supreme good, and to love him with singleness of soul, which love must constitute our highest felicity, our most perfect freedom? that the reward of virtue is virtue, and the punishment of ignorance and impotence is ignorance? and that every one should love his neighbor and obey the laws?'" That Spinosa was aware, however, that the strong meat of his philosophy was not fit food for babes, is shown by Mr. Lewes in an anecdote which he relates of Spinosa's landlady, who asked him whether he believed she could be saved by her religion, which she knew was not his. "Your religion," he replied, "is a good one; you ought not to seek another, nor doubt that yours will procure salvation provided you add to your piety the tranquil virtues of domestic life." Not the least interesting portion of Mr. Lewes's paper is the excommunication which was fulminated against Spinosa by the Synagogue of Amsterdam, and which is worthy of a place beside the similar manifestoes of the Romish Church. "We beseech the great God to confound such a man, and to hasten the day of his destruction. May God, the God of Spirits, depress him under all flesh, extirpate, destroy, exterminate, and annihilate him." "Which way soever the impious man turn, he will never find anything but contradiction, obstacles, and curses. His soul at his death will forsake his body, being delivered up to the quickest sense of fear, horror, and anguish; it will then be impossible for him to avoid the blow of death and the judgments of God. God send the sharpest and most violent evils upon him. Let him perish by the sword, by a burning fever, by a consumption, being dried up by fire within, and covered with leprosy and imposthumes without." "He will drink the cup of the indignation of the Lord, whose curses will cover him as his garments. The earth will swallow him up. God will extirpate and shut him for ever out of his house. Let God never forgive him his sins. Let the wrath and indignation of the Lord surround him and smoke for ever on his head. Let all the curses contained in the Book of the Law fall upon him. Let God blot him out of his book. Let God separate him to his own destruction from all the tribes of Israel, and give him for his lot all the curses contained in the Book of the Law." "Our army swore terribly in Flanders," quoth Uncle Toby, "but nothing like that." Such, in the eyes of his Hebrew brethren, was Baruch Despinosa, who dared to think for himself in matters that concerned himself and his soul's salvation; a man of the purest morals and the sweetest personal character; who chose poverty for his lot, living upon twopence half-penny a day, yet contriving to spare something for the necessities of others; who was the friend of the great Jean de Witt; who was invited by the Elector Palatine to accept the chair of philosophy at Heidelberg; and who was offered a pension by Louis XIV. if he would dedicate a book to him, a piece of royal flattery to which the honest, simple-minded thinker was insensible—replying that he had no intention of dedicating anything to his Majesty. Clearly there was something good in this man, whatever may be thought of his philosophy.

—The cost of manufacturing books in this country has driven a number of our publishers into the English market, and will drive others thither, unless the present system of oppressive taxation is revised. Many of the late publications of the Messrs. Appletons are manufactured for them in London, by Eyre & Spottiswoode, and other English houses. Messrs. Lippincott & Co., of Philadelphia, patronize the English book makers largely, taking whole editions of popular books, as the Globe Edition of Shakespeare; the favorite "Golden Treasury" series of Messrs. Macmillan & Co.; Figuier's "World Before the Flood;" Prof. Owen's "Comparative Anatomy and Physiology of the Vertebrate Animals," of which, by the way, the second volume is nearly ready; and most of the cheap English editions of the English novelists. Messrs. Roberts Brothers, of Boston, have about one-half their publications manufactured in England, the most recent instances being Combe's "Tour of Dr. Syntax," Butler's "Hudibras," and Miss Jean Ingelow's "Stories for Children." Mr. W. J. Widdleton is manufacturing books in England, while Messrs. Leypoldt & Holt are manufacturing theirs, at least the Tauchnitz series of "British Authors," of which they are the sole American publishers, in Germany. There is a moral in this, if our legislators had the wit to perceive it, and one not at all creditable to their sagacity as political economists.

—The establishment of agents, or branches, of English publishing houses in this country is likely to increase our stock of good reading during the present season, as may be gathered from the announcements of one of their number—Messrs. Strahan & Co.—who will shortly publish the following works: "Familiar Lectures on Scientific Subjects," by Sir John Herschel; "The Resources and Prospects of America," by Sir S. Morton Peto; "The Life and Light of Men," by John Young, LL.D.; "London Poems," by Robert Buchanan; "Family Prayers for the Christian Year," by Dean Alford; "The Dean's English," by Mr. G. Washington Moon; "Characteristics of Christ's Teaching," by Dr. Vaughan; "Essays," by Dora Greenwell, whose previous works were reprinted by Messrs. Ticknor & Fields; "Lives of Indian Officers," by John W. Kaye; "The Reign of Law," by the Duke of Argyll; "Days of Yore," by Sarah Tytler; "Reminiscences of a Highland Parish," by Dr. Macleod; "Cosas de España," by the author of "Flemish Interiors;" "Dr. Austin's Guests," by William Gilbert; "Wealth and Welfare," by Jeremiah Gotthelf; "Master and Scholar, and other Poems," by Prof. Plumptre, the translator of Sophocles; and a second series of "The Parables of our Lord," by Dr. Guthrie. This is a goodly announcement of books in press, though a solid one, it must be confessed.

—Messrs. Appleton & Co. have in the press: "Recent British Philosophy," by Prof. David Masson; a new and enlarged edition of Tyndall's "On Heat;" "The Life of Andrew Johnson, President of the United States," by a Southerner; a revised edition of the "Companion Hand-book of Travel in the United States;" Quackenbos's "Practical Arithmetic;" "Brevity and Brilliancy in Chess: a Collection of Games and Problems," by M. J. Hazeltine; and the "Annual Cyclopædia for 1865."

—The forgery of autographs is a distinct profession on the Continent, and one which can be made to pay handsomely by skilful hands. A case in point occurred last year, the autographs in question being a collection of letters of Marie Antoinette, which were purchased by Count Vogt von Hunolstein, a nobleman of Lorraine, and published by him in a volume, which occasioned a controversy between the experts of Germany and France; those of the former country, headed by Prof. Von Sybel, of Bonn, denying the authenticity of the letters, while those of the latter, with a few exceptions, maintained it, and with considerable heat. The Germans were generally thought to have had the best of it, owing to the researches of Prof. Von Sybel in the Royal Library of Berlin, where were a number of genuine letters of Marie Antoinette, with which he compared those of Count von Hunolstein, not at all to the advantage of the latter. The matter did not rest here, for we now learn that enquiries have been made into the antecedents of the collector from whom Count von Hunolstein purchased his collection, who was no less a person than M. Feuillet de Conches, Imperial Master of the Ceremonies, Introducer of Foreign Ambassadors, and Sub-Director of the Foreign Office. M. Feuillet, it appears, has been favored for ten years, or more, with the permission to take manuscripts and books from the Imperial Library to his own residence, a permission of which he has availed himself liberally. The pieces borrowed by him were invariably bundles of letters accounts, etc., of the last century, which at an early period were carefully counted when he returned them by certain doubtful officials, who, however, never found any of the number missing, although it seemed to them that the blank leaves, where such existed, were torn off. As blank leaves, however, were valueless for historical purposes the matter was thought no more of. A new director, M. Taschereau, entering upon his duties at the Imperial Library, he observed one day, in a conversation with M. Feuillet, that the library should never be deceived under his management by the pur-

chase of false autographs, since any one practised in the art could easily distinguish between genuine and forged documents. M. Feuillet did not agree with him, and gave his reasons: first, that imitation of ink and handwriting was not difficult to an expert forger; second, that it was easy to give the necessary crumpling to letters by sending them several times through the post; the third difficulty, which he considered the crowning one, lay in the nature and condition of the paper, a difficulty, by the way, which was early foreseen by the forger Ireland, who selected the paper on which he scribbled his atrocious Shakespeare forgeries from the fly-leaves of old books, and the blank leaves of old legal deeds, when either happened to bear the "jug" water-mark of the age of Elizabeth. M. Taschereau listened attentively, remembering the loss of the blank leaves already mentioned, but said nothing, though he probably "kept up a thinking." Not long since there was sold at auction in Paris a collection of autograph letters of Racine. The number of these autographs, seventeen, being the exact number of those in the Imperial Library, the purchaser was requested to produce them, when they turned out to be copies of the originals, with the exception that six of them were signed, probably for the sake of increasing their price at the sale, a blunder, since it was known that Racine was not in the habit of signing his letters. Enquiries concerning the persons to whom the originals had been entrusted disclosed the fact that M. Feuillet had had them in his possession for nearly two years. So stands the case at present, and it must be owned that it wears an ugly look for M. Feuillet, not only as regards the forged Racine letters, but also those of Marie Antoinette, for which he is said to have received eighty thousand francs.

—The late W. F. Fairholt, whose death we announced last week, has bequeathed his large collection of books of pageants, which contains many rare volumes, to the Society of Antiquaries, and with it the manuscript of an unfinished work from his pen on the pageants of the Middle Ages. His Shakespeariana, which includes a large volume of Shakespeare drawings, he has left to the Museum at Stratford-on-Avon, and a number of volumes, which he names, to the British Museum. The remainder of his library will be sold for the benefit of the Literary Fund.

—The late T. K. Hervey, who edited the *Athenæum* at one time for about eight years, is about to enjoy the honor of an American reprint of his verses by Messrs. Ticknor & Fields, who have in press a collection of them for their favorite "blue and gold" series. It will contain, we understand, all that Hervey published in the shape of verse during his life, with a selection from his manuscripts, the whole being edited by his widow, Mrs. Elenora Hervey, a poet herself, in some sort, and a novelist after a fashion, through her recent romantic tale, "Snooded Jessaline, or the Honor of a Noble House." We anticipate but little from the forthcoming volume, which will be sentimental, to say the least. Hervey's best work, as we remember it, is "The Book of Christmas," a readable and interesting account of that sacred festival of the Christian Year.

SCIENTIFIC.

Transporting Power of the Fog-vesicle.—That fogs and mists possess the power of transporting vapors, gases, odors, and the like, or even minute solid particles, as in smoke, is a fact well known to the observant. Many persons dwelling far to the leeward of certain manufacturing establishments are well aware that offensive or irritating gases may be caught upon the lap of a fog as they issue from the chimneys of the factory and carried away for miles. The same thing is apparent when the sea-fog sweeps inland, bearing the "smell of the sea," as the landsman calls it, or when the land-mists drift out on to the ocean, carrying to the incoming mariner the "smell of the land"—the odors in question, both that "of the land" and that "of the sea," being, in reality, one and the same, viz., the odor of the strand.

A somewhat analogous instance of the transporting power of the mist is seen in the long-persisting and all-pervading smoke-fogs which arise from burning forests and peat-bogs towards the close of our northern summers. These autumnal smokes are really of the nature of mists, as will appear from a moment's reflection upon the manner of their formation and upon the chemical composition of the products of the combustion of a forest. A very large proportion of these products is nothing but aqueous vapor, which, under the peculiar circumstances of the case, immediately assumes the vesicular condition which we see in fogs and clouds.

In defiance, then, of all the ordinary laws which control the diffusion of gases, fogs can buoy up, hold for a long time, and carry to great distances, odors and vapors which, under ordinary conditions, are but slightly volatile; and in the same way, though in a lesser degree, they can transport solid substances. Besides the soot above mentioned, another familiar instance of this transporting power, as regards solids, is that of the boracic acid brought up by steam jets which issue from the earth in the volcanic districts of Tuscany, and there is another striking example of the same thing in the salt which is carried inland by fogs from the ocean. As an evidence of the extent to which this process goes on in some localities, we may cite the experience of the farmers upon our eastern seaboard, where fogs are frequent. It is there found, even at distances ten or fifteen miles from the salt water, that animals have none of that craving for salt which is so strong in the cattle of the inland districts; and the farmer consequently pays no heed to a matter which is so important to the members of his calling elsewhere. He takes no pains to "salt his cattle," for he knows from long experience that they will obtain a sufficient quantity of this condiment in and upon the grass which they daily eat.

As bearing upon these well-known facts, the system of applying medicaments and perfumes by the so-called method of atomization which has come into vogue within the last few years, would appear to be worthy of the careful study of meteorologists; the phenomena of transportation exhibited by the "atomizer" being evidently akin to those manifested by the fogs and clouds which occur in nature. In order to atomize a substance, it is first dissolved in water, and this aqueous solution is then, by means of suitably disposed jets of air or steam, driven out of minute orifices in the form of a finely divided spray or mist. This spray is inhaled by the patient, and the physician is thus enabled to apply his therapeutic agents, such as the various astringents and alteratives, directly to the diseased part of the throat or bronchiæ.

Apart from its intrinsic scientific interest, this system of transporting drugs by atomization was undoubtedly a very important addition to the methods employed in the art of healing. But, as now appears, it has led to a discovery of still greater consequence, viz., to the production of local anæsthesia by freezing through the agency of certain volatile liquids.

Local Anæsthesia.—One invention begets others, often with great rapidity, the uses of the offspring being in many instances surprisingly unlike those of the parents. As a case in point we have, flowing from the method of atomizing liquids, to which allusion was just now made, the very important improvement of Drs. Richardson and Bigelow for producing local anæsthesia by means of the vapor of ether or of petroleum-naphtha. Scarcely had the atomizer become firmly established as a part of the physician's outfit when it occurred to Dr. B. W. Richardson, of London, that by employing in this instrument some highly volatile liquid, like ether, and throwing this out as a volume of fine spray, there would be produced, by the evaporation of the ether, such intense cold as would quickly benumb, and so render insensible to pain, any small portion of the human body that might be subjected to it. Dr. Richardson at once perfected his apparatus and obtained with it very satisfactory results, the ether spray having caused the mercury of a thermometer which was immersed in it to fall to 4° below the zero of Fahrenheit's thermometer within thirty seconds, and upon being thrown upon the skin such entire insensibility was produced that a needle could be passed through the part without being felt. "When the ether spray is directed upon the outer skin, the skin is rendered insensible within a minute; but the effects do not end here. So soon as the skin is divided, the ether begins to exert on the nervous filaments the double action of cold and of etherization, so that the narcotism can be extended deeply to any desired extent. Pure rectified ether used in this manner is entirely negative. It causes no irritation, and may be applied to a deep wound without any danger. . . . One or two precautions are necessary. It is essential, in the first place, to use pure rectified ether. Methylated ether causes irritation; and chloroform, unless largely diluted with ether, does the same." Dr. Richardson, in his published account of the invention, intimates that "if an anæsthetic fluid of negative qualities as regards irritation of nerve, and which has a boiling point of 75° or 80°, can be obtained from the hydrocarbon series, the deepest anæsthesia may be produced, and even a limb may be amputated by this method." The results of Dr. H. J. Bigelow, of Boston, go far to corroborate the correctness of Dr. Richardson's idea. By substituting for the ether that portion of petroleum-naphtha which boils at 70°, Dr. Bigelow is able to obtain a reduction of temperature even to 19° below zero, so that the skin can be frozen hard in five or ten seconds. The naphtha is convenient of application, is comparatively odorless, and is far less costly than ether. "Applied to the skin a first degree of congelation is evanescent; . . . but if continued or used on a large scale, the dangers of frost-bite and mortification must be imminent. . . . The opening of felons and other abscesses, the removal of small tumors, small incisions, excisions, and evulsions, and perhaps the extraction of teeth, may be effected by means of it with ease and certainty; and for these purposes surgeons will

use it, also, perhaps, for the relief of neuralgia, chronic rheumatism, etc. and as a styptic, and for the destruction by freezing of erectile and other growths. But for large operations it is obviously less convenient than general anæsthesia, and will never supersede it."

The naphtha in question, as is well known to chemists, is a mixture of several different members of the hydro-carbon series of hydrides of the alcohol radicals, containing notably the hydrides of butyl, of amyl, and of hexyl, together with other still more volatile hydrides which have not yet been examined. Of the products above mentioned the hydride of butyl boils at a temperature as low as 32° F.

Fracture of Large Masses of Iron.—Hitherto it has been a matter of no little labor and difficulty to break up large pieces of cast-iron—old cannon, for instance—into fragments small enough to be conveniently remelted. An ingenious method of overcoming this difficulty has recently been brought forward in France. It depends upon the familiar physical facts that water is, practically, as good as incompressible, and that liquids transmit equally in all directions any pressure to which they may be subjected. A hole having been drilled into the article to be broken, to a depth equal to about one-third the thickness of the iron, this hole is filled with water, and then closed with a closely-fitting steel plug. The hammer of a pile-driver being now allowed to fall upon the plug, the mass of cast iron will be broken in two at the first blow. The plan is, of course, identical in principle with the familiar experiment in which an earthen jug completely full of water is shattered by driving in the cork by a sudden blow of the hand.

EDUCATIONAL.

The "Back Bay Enterprise," in Boston, was a Yankee notion which, with Yankee forethought, has been turned to good account for the promotion of learning. It was proposed, in 1859, to give all the proceeds of the undertaking to the Massachusetts School Fund, but more recent legislation has distributed a good share of the profits among various establishments of science and art. A recent public document states that over four million feet of land have been "filled" (that is the official term), yielding the State a net profit of nearly a million and a quarter of dollars already. Quite as much more profit is expected from "filling" proposed but not yet accomplished.

The State has given, in land, to the Public Garden, 120,000 square feet; Institute of Technology and Society of Natural History, 131,520 square feet; City of Boston, 44,800 square feet; and in money to the Museum of Zoölogy, $100,000; Tufts College, $50,000; Williams College, $25,000; Amherst College, $25,000; Wesleyan Academy, $25,298 04; Massachusetts School Fund, $456,930 06; reserved by the Commonwealth, $613,157 53.

—A private letter informs us that the citizens of Nashville, Tennessee, have shown their good sense by returning since the close of the war to the maintenance of good public schools. Before the rebellion these institutions were the pride of the people. The teachers now employed (two of the principals being graduates of a Northern college) are determined that the schools shall merit in the future the same support which they had in the past. The city is said to have made an investment of $200,000 in the schools, and it maintains them at a yearly expense of $60,000. The whole number of scholars is about 2,000. One of the graded schools numbers 700 pupils.

—In various parts of the country what is called "The High School Question" is now under discussion. This includes the enquiry as to where the state should stop in its efforts to promote the instruction of the people, and where private schools or incorporated academies should be introduced. It is true that the subject has received a great deal of attention from able minds, but still an exhaustive or masterly consideration of all which it involves has never, so far as we are aware, been attempted. Such a treatise as thorough investigation would lead to is much needed. A very important and suggestive essay on the advantages of state institutions for what we call "high school" discipline, and what is called in Europe "secondary instruction," may be found in the lately published volume of essays by Matthew Arnold, a son of the renowned master of Rugby. The article is entitled "A French Eton," and, probably because it is included with a collection of pieces on purely literary topics, it seems to have escaped the attention of many who belong to the class of educators. The writer combats in a very vigorous manner the theory which is often heard in the mouths of American, as well as of English, grumblers, that "the state mars everything which it touches:" "it attempts to do things for private people, and private people could do them a great deal better for themselves." His exposition of the value of a public system of instruction (including "high schools") in promoting the interests of "the middle class" is well put. Considering that in this country "the middle class" comprises nine-tenths of the inhabitants, the separate publication of this essay, and, at any rate, its general perusal, might be productive of excellent results. Nearly all that he says of the wants, the power, and the capacity of "the middle class" in England may be applied with slight changes to "the people" in America. With us the necessity of higher education for the great body of our citizens is made apparent by the multitude of uneducated men who are brought into public life. In a land where any man may be called to any position, the advantages of widely diffused culture are apparent; but experience seems to show that this cannot be secured without liberal contributions and constant energy on the part of the state.

—A school has been established in New Orleans for the training of colored teachers, under the direction of Mr. Mortimer Warren, for the past year superintendent of the schools for freedmen in that city. The scholars are taken from the higher classes of the city schools for colored children. This normal school is a good step forward, and, if rightly managed, should receive particular encouragement.

—A catalogue of the graduates of the Union Theological Seminary in New York has recently been prepared by Rev. Dr. Hatfield and published. It contains not merely the names and titles of the alumni, but a brief record of their public career and a statement of their present residence and work. It bears evidence of great painstaking, and, although sharp eyes will detect occasional inaccuracies, it is probably the most complete and convenient catalogue of the sort ever published in this country.

RENAN ON FRENCH ART.*

The fourteenth century is not marked in the history of France as a century of great events; but, nevertheless, the steady struggle which is to be traced all through it, between the aggressive dominion of the church and the rising ambition of the kings, imparts to it a certain philosophical interest which more imposing periods fail to create. Yet it is in just this respect that the work undernoted seems to us defective.

M. Le Clerc was charged by the Institute with his part of the task—the condition of literature as long ago as 1842; and not a day has passed since, he says, in which he has not collected a new fact or written an additional line. In the discharge of his duty, in portraying the condition of the fine arts, M. Renan has made minute investigations throughout the whole region of the ancient Ile de France and of Picardy, where the Gothic art is supposed to have arisen. The work is thus the fruit of much labor, and a second edition of it in the course of two or three years shows that it is justly appreciated. M. Le Clerc, indeed, whose contribution is the larger and in many respects the more valuable of the two, has accumulated many curious facts touching the religious orders and the popes; while his careful illustrations of the state of the theology and rhetoric and language and dialectics of the age in their various aspects, as well as his sketch of French literature in Europe, must commend itself as a useful guide to one who is investigating for himself the development of that wonderful mediæval life. But the work, in both parts of it, though an excellent digest, is very far from being that luminous philosophical exposition either of the literature or of the art of the fourteenth century which the reputation of the younger of the writers at least would have led us to expect.

In his remarks, however, upon the origin of Gothic architecture, M. Renan has exhibited even more than his usual perspicuity of criticism. That the Germans had as little to do with this original creation of the Middle Age as the Arabians, to whom it has been so often ascribed, will seem to many, doubtless, a somewhat startling proposition. M. Renan's analysis, however, of the manner in which the Roman basilica was transferred by degrees into the Gothic cathedral cannot fail to interest, if not to satisfy, the most credulous.

The Gothic style, he affirms, which began to appear in the middle of the twelfth century, and, never for a moment stationary, was complete at the beginning of the fourteenth, and finally abandoned in the seventeenth, took its rise in the Ile de France and the surrounding districts—that is, in the original true France, the region in which, a hundred and fifty years before, the Capetian dynasty had been established. The edifices which exhibit and explain the transition from the Romanesque to the Gothic style are all to be found there. The cathedral of Noyon, for instance, shows that there must have been a time when both styles were followed simultaneously. Indeed, in all the churches in that region the two styles are profoundly blended. The general aspect may be Romanesque, though the leading features are

* "Histoire Littéraire de la France au Quatorzième Siècle: Discours sur l'Etat des Lettres, par Victor Le Clerc, Membre de l'Institut; Discours sur l'Etat des Beaux-Arts, par Ernest Renan, Membre de l'Institut. Seconde édition. Paris: Michael Levy Frères. 1865." (2 Vols.)

Gothic; while all the characteristics of the Gothic may be evident, though the building is Romanesque.

Thus the Gothic architecture, arising in the very heart of the French nationality, so to speak, in this rich and fruitful district, which was perhaps the first to throw off the feudalism of the Teutonic races, was purely French. There was no Italian or German element whatever in it. The borders of the Rhine were still filling with Romanesque structures, while the *chefs-d'œuvre* of the Gothic architecture had already been reared in the north of France. The Gothic cathedrals of England, built in the twelfth century, were the work of French artists. Even up to the fourteenth century the Gothic was called the "French style," *opus francigenum*. But the atrocities of the Inquisition, the misfortunes of a hundred years of war, extinguished the French genius. Strasburg and Cologne became the schools of the art which France had created, and thus the "French style" passed for German.

The manner, however, in which, according to Renan, the Romanesque became by mere expansion the Gothic style, is too curious to be passed over without a brief explanation. Before the eleventh century, as is well known, the churches of France, if not mere imitations of the Byzantine type, were wretched copies of the basilicas of the Christian emperors. After the eleventh century, however, the elements of these basilicas were changed in all directions. For the framework which supported the roof was substituted the arch; buttresses were applied to the walls; the form of the church became a Latin cross; two towers adorned the entrance, and a rose-window completed the façade; the choir was lengthened, and a central cupola arose over the junction of the nave and transept; while in the interior appeared an ever-increasing prodigality of wealth in decorative sculpture and colored incrustations on the walls.

Thus arose the Romanesque style, which in the eleventh century covered France with magnificent structures; in the central and southern part of the kingdom, however, its progress was timid and slow, but in the north it was rapid and complete. From the Romanesque style the change was easy and natural to the Gothic; the principles being established, needed only to be carried out in detail. To use M. Renan's phrase, it was as if a breath were breathed upon the Romanesque basilica, and it dilated in all its parts, and became aerial, and swam in light and color. The Romanesque aimed at solidity, the Gothic at lightness; the old narrow windows became high and broad; the architect was eager to invent novel and almost deceptive methods of construction.

Thus the Gothic cathedral is but the Romanesque basilica with a soul breathed into it; and thus from the Romanesque basilica to the Christian basilica of the Constantines, from the Christian basilica of the Constantines to the churches of the ninth and tenth centuries, from these again to the Romanesque basilica, and from that to the Gothic cathedral, there runs a line of direct succession. However little analogy there may seem to be between them, Notre Dame at Paris is a logical evolution of San Paolo fuori le Mure at Rome. As the Middle Ages created in Italy out of the crumbling elements of the ancient speech a new language adapted to its new condition and wants, so in the rest of Europe the new time created a fresh instrument for the expression of its new religious life. The Gothic cathedral is to the Roman basilica what the language of Dante is to that of Virgil, not the degradation of barbarism, but the inspiration of a rising civilization.

The Gothic architecture bears a resemblance, indeed, to the Arabian, but it is a resemblance which arises merely from their point of departure. One is derived from the Romanesque, the other from the Byzantine type; and both the Romanesque and Byzantine were corruptions of the classic type. The Gothic and Arabian styles, therefore, though somewhat analogous, really owe nothing to one another. They represent tendencies profoundly different. Unlike the ancient, however, the Gothic architecture bore in itself the seeds of its own destruction. If the human race had disappeared the morning after their erection, the temples of Baalbec and of Athens, as Renan remarks, would have been still standing entire—a Gothic cathedral would not have survived a hundred years. The Gothic architecture was, in a word, a prodigious *tour de force*, followed by complete exhaustion; yet if it died of subtility, it accomplished at least one remarkable result, in that it secularized art.

SERMONS TO CHILDREN.*

Mr. Brace has been for ten or twelve years engaged in philanthropic labors amongst the poor in this city, and has become, we suppose we may say, the leading American authority upon all questions relating to the possibilities of reform amongst "the dangerous classes." He has been dealing during the whole of that period with one of the most interesting and most momentous problems presented by modern civilization to thoughtful students of society, and has, no doubt, accumulated a large body of most valuable experience. And yet, if we are not mistaken, the volume before us is the first contribution made by him to the literature of his pursuit. He has published two books of travels and a work on ethnology, all valuable and instructive, but not one of them treats of things, as this does, on which he can speak with the authority of a master. We feel bound to say that this is not handsome, and that if the obligation to write books ever rests on a man at all, Mr. Brace has not yet discharged his duty to the public.

There are probably few stories in the romance of street life, or in the chronicles of Christian charity, more interesting than the following account of the foundation of the "News-boys' Lodging-House," in which the sermons before us were delivered:

"While engaged as secretary and trustee of the Children's Aid Society, in 1853–4, I was pained at the sight of such numbers of news-boys and street-boys, sleeping about at nights near the newspaper offices, in boxes or under stairways. I remember, one cold night, seeing some ten or a dozen of these little homeless creatures piled together to keep each other warm beneath the stairway of the *Sun* office. There used to be a mass of them also at the *Atlas* office, sleeping in the lobbies, until the printers drove them away by pouring water on them. One winter an old, burnt-out safe lay all the season in Wall Street, which was used as a bedroom by two boys, who managed to crawl every night into the hole that had been burnt. I was often amused at their accounts of their various lodgings. 'Oh, mister,' one said, 'there's nothing like them steam gratin's—it's just as good as a feather bed! And, next to 'em, I likes a good box of sand, 'cause you can git it all up 'round you, and kinder snuggle in it; but bummin' is hard work in a nor'-easter.'

"The boys were, as might be expected, a fighting, gambling set, and the little ones were continually plundered by the larger. On enquiring among the missionaries and others of the lower wards, I could not learn that these lads ever went to a Sunday-school or church, or ever had any good public influence exerted on them.

"Occasionally, some unusually enthusiastic street-preacher would go among them, but they 'chaffed' him so that he could do nothing for them.

"I asked what became of them, but, as with Dickens's 'post-boys,' no one seemed to know, until a printer undertook one day to show me, and we found some dozen young men who had been news-boys in the back room of a gin-shop, all more or less drunk, though it was then morning.

"Thinking it necessary to consult the police as to any plans which might be adopted for the improvement of these lads, I called upon Capt. Matsell, the chief. In reply to my suggestions, he said, with a smile at such mistaken benevolence, 'My dear sir, nothing can be done for these boys! They are a set of perfect banditti!' I had resolved, however, to attempt a simple experiment—to open a lodging-house for them as the entering wedge for good influences.

"The especial condition for the success of the movement, however, was the man to carry out the execution of it. Providentially, at this time, I chanced upon one of those men who are, perhaps, peculiar to America—a skilful mechanic, self-educated, of much natural tact, with an unbounded pity for the weak and miserable, and a good deal of sternness toward the lazy and shiftless, and who had been long at work among the children of the Sunday-schools, Mr. C. C. Tracy. As it turned out, not one man in a thousand would have been so well adapted to open such an enterprise. He happened to be temporarily unemployed (having just sold out the good will of his shop and tools), and, much against the advice of his friends, agreed to take charge of the intended lodging-house. He at once began his search for a house, but few would admit such a set as the news-boys then were within their building.

"At length he discovered an old, begrimed loft in the top of a building on the corner of Fulton and Nassau Streets, the '*Sun* building.' The owner, Mr. M. Y. Beach, began his long course of kindness to us by saying we should have that room for the experiment if every tenant left the building! Our plan was to divide the loft into a school-room, bed-room, office, and bath-room, and to furnish the bed-room with wooden 'bunks,' placed one over another, so as to hold the most lodgers in a given space. To Mr. Tracy was left the general carrying out of the plans with whatever changes he might think best.

"In a few weeks we had (at an expense of about $1,000), all furnished and nicely equipped, a lodging-house that could accommodate seventy-five lodgers. Notice was given in the papers, and Mr. T. himself spoke to many of the leading boys, who always carried with them a train of imitators in whatever they undertook.

"The first night (March 18, 1854), the school-room was crowded with a motley congregation of ragged and rough boys—many having come in only to make a disturbance. Mr. Tracy addressed them simply and kindly, and told them the objects of the plan: that we wanted to prevent them from growing up vagrants, and to save them from exposure to the weather, and consequent disease, and to help them on in the world. But that they were not objects of charity, but each one a lodger in his own hotel, paying his six cents for a bed, and the only rules were that they should keep order among themselves and use the bath. They cheered him warmly, and a larger boy, a 'speculator,' created a great impression by paying at once his whole week's lodging in advance. Those who had come merely 'to make a row' left in disgust, and the others passed a quiet evening, and were greatly delighted with the luxury of plenty of cold water in the bath.

"When they were 'turned in,' the superintendent could hear their exclamations of satisfaction. 'Better than bumming—hey, Jim?' 'Rather warmer than the soft side of a plank, aint it?' 'Did ye nivir see a bed

* "Short Sermons to News-boys. By Charles Loring Brace." New York: Scribner & Co. 1866.

afore?' and the like. The next day several said they 'could n't sleep, the beds were so soft!' During the night there was 'larking' going on in the stairways by the outsiders; the gas-burner was twisted off, which might have been followed by serious consequences if Mr. Tracy, expecting this, had not provided a cut-off in the inside.

"The next evening more came in to take beds. The superintendent talked pleasantly and instructively to them, and the boys, feeling that the keeping of order depended on themselves, were very quiet. They seemed to enjoy the lodging-room very much, but one thing they could not understand, and were continually 'speering' after—What all this was for? Some whispered, 'It 's a House-o'-Refuge trap!' another, 'I know—it 's worse 'an that—it 's *a Sunday-school trap.*'

"Their especial vices Mr. T. soon found to be their wasting of money and their gambling. Some of the more active boys earned sometimes from $3 to $5 a day with the sale of 'extras,' and the smaller averaged seventy-five cents. Yet every penny went for follies—theatres, cards, dice, policy-tickets, and games with pennies, while the lads themselves remained ragged and poor. To correct these habits, he introduced innocent games, such as chequers, backgammon, and others; and he contrived, what has since been a great blessing to hundreds of street-boys, the 'News-boys' Bank.' This was simply a table with a drawer divided into separate little compartments, each with a slit in the lid, into which the boys dropped their pennies; each box being numbered and reserved for a depositor. The drawer was carefully locked, and, after an experience of one or two forays on it from petty thieves who crept in with the others, it was fastened to the floor, and the under part lined with tin.

"The superintendent, following his usual plan, called the lads together for a meeting, told them the object of the bank, which was to make them save their money, and put it to vote how long it should be kept locked. They voted for two months, and thus for all this time the depositors could not get at their savings. Some repented and wanted their money, but the rule was rigid. At the end of the period the bank was opened in the presence of all the lodgers with much ceremony, and the separate deposits were made known, amid an immense deal of 'chaffing' from one another. The depositors were amazed at the amount of their savings; the increase seemed to awaken in them the instinct of property, and they at once determined to deposit the amounts in the city savings-banks, or to buy clothes with them. Very little was spent foolishly. This simple contrivance has done more to break up the gambling and extravagant habits of the class than any other one influence. The superintendent now pays a large interest on deposits, and our trustees have offered prizes to the lads who save the most. During the present year (1865) the savings in bank of the boys will amount to about $250 a month, beside what is deposited in the city banks or invested continually in business."

How the religious meetings, in which the sermons were delivered, came to be held, is thus explained:

"We chanced upon our religious meetings something in this wise. The boys had attended on a Sunday some public funeral, which impressed them much, and, while talking together earnestly over the matter, Mr. T. suggested that they should hear a chapter read and have a prayer. They assented, and a meeting was held, from which has arisen the long course of religious meetings held since for the news-boys, of which this little volume of sermons is one result."

Of the sermons, of course, anything like literary criticism would be impertinent. The three things which discourses to children ought to have—simplicity, directness, and abundance of illustration—were all present in them. They have, in a remarkable degree, that excellence which we seldom remember to have found in a "child's book," of being written in language such as children use and can understand. "The Parable of the Rich and Poor Boy," that on "Thankfulness" and on "Sacrifice," are, perhaps, the best.

The Resurrection of the Dead; considered in the light of History, Philosophy, and Divine Revelation. By Rev. Hiram Mattison, D.D. (Perkinpine & Higgins, Philadelphia.)—There is a distinction not altogether without a difference between the title of this work as it appears inside the book upon the title-page and as it appears outside, where we read "*The Resurrection of the Body.*" "Revelation," said somebody, discussing the doctrine of man's immortality—"Revelation has changed the interrogation point of the heathen philosopher to the exclamation point of the believing Christian." It was a figure more bold than happy; but still it is true that all the sects of Christendom with one accord declare that though a man die he shall live again. But what shall be the manner of the new life? Too many answers, Mr. Mattison thinks, are given to this question; too many Christians look for an answer to philosophy, falsely so called; "it becomes necessary to contend earnestly for the faith once delivered to the saints." In the world to come man will not exist as a disembodied spirit; the resurrection is not simply the quickening of the soul in regeneration, as some say; it is not the emerging of the soul from the body in the moment of death, as the Swedenborgians hold; it is not the construction of a new body, as Origen falsely maintained; it is not the evolution of a body from a small portion of the old one. It was to combat all these notions, to prove that in the hereafter the soul is to have a body, and to describe its structure and its various powers and functions, that this book was undertaken. The author assumes the truth of Scripture, and the correctness of the common version. Standing upon this ground he combats all the theories that oppose his own. His own may be briefly stated, and may, perhaps, be called the popular belief. At the end of the world, at the sound of a trumpet, the dead are to rise. All come forth—those who have been buried in the earth for ages, "whirled round with rocks and stones and trees," a part of the general frame of nature; those who were dropped into the sea; those whom fire burned, whose ashes the wind scattered; those who were eaten by beasts or whose decaying substances has nourished plants, and those also who ate the beasts and were nourished by the plants that lived on the flesh of the former generations—all come forth with a body at once perfect in all its parts and identically the same with that which they had in this life. No man should find this hard to believe. For, firstly, it is easy for God to order that the "small part of human dust which actually becomes part of vegetation should lodge in the roots and stalks and leaves without ever becoming a part of the grain" on which men feed; and, secondly, if this consideration should fail to satisfy the rational enquirer, the whole subject of the resurrection "must be studied in the light of miracles." It would be too much to say that the book adds anything to our knowledge, but it presents in a readable form the belief which is held upon this subject by a very large number of Christians.

Honor May. (Ticknor & Fields, Boston.)—The young person—for it is evidently a young person—who writes this book is fond of music, especially vocal, and of virtues, especially truthfulness. She—for it is unmistakably a lady—admires self-abnegation, devotion to an art, and strength to live without love. She believes profoundly in moral independence, the German school of singing, a pale, blond style of beauty for a woman, and in decorous behavior at concerts. With these unimpeachable tastes, she reads "Charles Auchester" and *Dwight's Journal of Music*, is seized with a divine afflatus, sees Messrs. Ticknor & Fields at her service, and writes a book. She will pardon us for thus sketching her own character, instead of Honor May's, or another of the personages of her story, because it is the single real one she has offered to our consideration. And of it, we refer only to those points which are admirable; there are others, quite as evident, of the kind that must inevitably appear where a novice brings to her undertaking enthusiasm instead of judgment, personal proclivities instead of observation, self-confidence instead of self-criticism. Shoals of books are written like this, some better, most not so good, which hold the mirror up to nobody's nature but the author's. The majority fall below "Honor May," because they exhibit scarcely anything besides the uncontrollable desire of their authors to give the public a sort of inventory of their smartnesses, their griefs, their aspirations, and get its admiration and sympathy in return. But beyond this weakness, the writer of "Honor May" entertains a laudable desire to advance the art of singing, for which desire we give her all credit, although the best part of its execution is not different from directions to be found in any good book on singing.

Where the moral intention of a story is so excellent, the task of censure is to the last degree ungrateful. To those fresh souls, full of strength and energy and self-reliance, chafing for any kind of action, so that it be not commonplace and under a bushel, it were far easier to say, with vague application: "Work! the night comes—the world needs a helping hand—labor in the cause of truth," etc., than, "He also serves who only stands and waits."

St. Martin's Summer. By Anne H. M. Brewster. (Ticknor & Fields.)—"While the rest," says the author, at Amalfi, "were loitering over some of the cathedral wonders, I stood alone on the top of the high broad stone steps, and gazed dreamily down into the square or piazza beneath. . . . I thought of those wonderful old Catholic days in 800 and 900 A.D., the first period of Amalfi's greatness. Then my memory swept on to 1200, 1300, 1400," etc. This rather ludicrous admixture of Murray's guide-book and the author's sentimentalism is found in varying proportions throughout the whole book, together with copious quotations from the poets and other writers, and an attempt to convert a diary into a romance. The result is what might be expected. We neither learn anything fresh or valuable about Italy nor get in the least interested in the lay-figures of the narrative. Miss Brewster gives evidence of extensive reading, but scarcely any of a capacity to compose a novel. It would be difficult to find more unartistic handling of good material than is shown in the episode called "Janet's Story." There is a work of fiction, based on a familiar acquaintance with Italy, of which it might be difficult to assert whether a description of the country was the chief or only a subordinate object, but which blends so perfectly romance and reality as to be in signal contrast to "St. Martin's Summer." We refer to Hawthorne's "Marble Faun." But in suggesting a comparison between the two books we perceive that we have done what the author deprecates in her preface—judged her *souvenir de voyage* ungently.

Indian Corn: its Value, Culture, and Uses. By Edward Enfield. (Appleton & Co., New York).—As its title indicates, this volume treats of the great American cereal. The author professes to be a practical cultivator of the crop, and has gathered much information relating to it. In fact he has too evidently "crammed" for the work by the perusal of many agricultural periodicals and the agricultural columns of the secular newspapers, and has not always well digested his materials. We notice some minor errors as a consequence, and we hope that in a second edition he will clothe his thoughts in plain language. The following will illustrate what we mean. The fertilization of the embryo seeds by the pollen falling on the silken pistils is described in this style: the "farina fecundans," "descending from the tassel, lights on the silken drapery of the ear, and the rudimental grains are thereby fertilized;" and this is about all the light we get on this important matter, although another chapter is devoted to hybridization, which depends upon it, and then follows a flowery outburst of reflections which he might have spared his readers without wronging them. In this way he is constantly soaring above and beyond the corn-field, and his flight is not always graceful. Nevertheless, if the practical farmer, for whom this work is especially written, will peruse it with care, and then only "hold fast that which is good," he will forget these and other defects, and cannot fail to gain much really valuable instruction and many useful hints from it. It lacks the convenience of an index.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

All Communications which pertain to the literary management of THE NATION *should be addressed to the Editor.*

MR. LINCOLN'S SUCCESSOR.

THE advocates of Mr. Johnson's policy lay great stress upon its supposed identity with the plans of Mr. Lincoln. They urge that Mr. Johnson has simply acted as Mr. Lincoln's successor, and has inherited his policy as well as his office. It is said that Mr. Lincoln had committed himself to a particular scheme of reconstruction, that the people had endorsed that scheme by re-electing him, and that Mr. Johnson deserves commendation for having walked in the footsteps of his predecessor.

This argument is fallacious in several points. It is not true that the people meant to endorse all that Mr. Lincoln ever did or said, by re-electing him. Even the convention which nominated him by acclamation was opposed to some important features of his policy, and adopted resolutions which were designed to modify his course. Hundreds of thousands voted for him cheerfully who disapproved of some of his actions, and were anxious that they should not be made precedents. The same men who voted to re-elect him voted also to re-elect members of Congress who had differed widely from some of his views. The people had great confidence in Mr. Lincoln's honesty, patriotism, and general wisdom; and knowing that it would be impossible to find any man whose conduct in the same position would be faultless, they judiciously resolved to continue in office one whom they could trust for most purposes, whom they could influence by their will, and whom they knew to be always true to his sense of duty, and willing to receive new light from any quarter. Mr. Lincoln's tractability was one great cause of his popularity. He never boasted that he was too old to change his opinions. Accordingly, the most radical were willing to support him, confident that time and the logic of events would bring him to the right side. If he was not in advance of his party, he was at any rate not far behind, and no one feared that he would betray either his party or his country.

Mr. Lincoln had no cast-iron policy of reconstruction. The very ground upon which he refused to sign the bill passed by Congress upon that subject was, that he did not believe it safe to adopt any inflexible policy. He preferred to await further developments, and to make no decisions in advance of the necessity for them. Nothing can be more absurd than to cite his example in support of the effort now made to thrust rebels into power under an inflexible and infallible "plan."

The position of Mr. Johnson is very different from that of Mr. Lincoln. He was not chosen by the people for the office which he now fills. He was not selected as a representative of the mass of his party, but, in accordance with a universal custom, was taken up as a compliment to a small, though respected portion, of that party. He had not been tried in the same sphere with Mr. Lincoln. His training, his tastes, his associations, were dissimilar. It is not reasonable to ask the people of the North to put as unrestricted confidence in him as they did in a man of Northern training, of long fixed sympathy with the cause of emancipation, and of political associations not open to doubt. There is no need to impugn Mr. Johnson's good faith. Most men will trust their own brothers more than they will any new acquaintance, however respectable and honorable he may be. Mr. Lincoln was like a brother to every loyal man at the North. Mr. Johnson is a new friend, highly recommended, no doubt, and many of whose acts entitle him to confidence; but, after all, he is not Abraham Lincoln, nor can he ever have such a hold upon our affections as Lincoln had.

The people intended, by their votes in 1864, to give the control of public affairs to Mr. Lincoln and Congress jointly. Congress alone remains to represent the popular feelings. There is no ground for supposing that Mr. Johnson understands the wishes of the people any better than Congress. He was not elected by a larger constituency. He is not so closely in communion with the electors as a Congressman necessarily is. The form of the Constitution gives him disproportionate power, but there is nothing in his situation which entitles him to a moral weight equivalent to two-thirds of the national legislature.

In his peculiar position, a double measure of loyalty to his party would have appeared graceful in Mr. Johnson. The declaration which he was so fond of making last fall, that he disclaimed all partisanship, would have been highly becoming in one whose danger lay in that direction, and whose political principles were undoubted; but in a new convert, suddenly elevated to power by his party, a keen sense of propriety would dictate rather an assurance of his continued fidelity to the principles of the party than an ostentatious assumption of independence. So, in a man like Mr. Lincoln, expressly chosen for the position which he occupied, thoroughly known and trusted, familiar with the people of the North, and fully in sympathy with them, it might be excusable, nay, even commendable, that he should oppose the policy to which Congress inclined, and yet in Mr. Johnson the same action might indicate tendencies of the most dangerous nature. Had Mr. Lincoln vetoed the Freedmen's Bureau bill, no alarm would have been excited, because all the world would have known that some measure having the same ends in view, but altered in detail, would be sure to meet his approval, and that his objections arose from a conscientious interpretation of the Constitution, and not from motives of policy. But when Mr. Johnson's veto appeared, even those who coincided with its reasoning on some points felt troubled by the conviction that its real motive was not fully set forth, and that the arguments used were rather an excuse for than the cause of the veto. These thoughts were instinctive. They were not hammered out by any logical process. Much fault was found with those who expressed such views, and yet subsequent events have abundantly vindicated them.

Viewed in any aspect, this claim of an inherited right to confidence, by which any one who succeeds to the place of another is entitled to unqualified approbation if he does this year the same things which his predecessor was allowed to do last year, is destitute of reason. Every time has its peculiar need, and every man his peculiar gifts. The policy which in 1864 might have been successful, might in 1866 be a total failure. The policy which might, under one man's direction, be beneficial to the country, may, in the hands of another, equally sincere and well meaning, work irreparable injury. On the ground, therefore, that the men are different, that the times are different, that events have happened which have largely modified the people's judgment, and finally that Mr. Lincoln had wisely abstained from committing himself irrevocably to any plan of reconstruction, we deny that Mr. Johnson has a right to demand our support in carrying out, as an inflexible method, the experimental processes adopted by Mr. Lincoln two years ago.

THE HERALD AND THE NORTH AMERICAN REVIEW.

IN the last brilliant number of our leading review, forty-five pages are occupied by a very entertaining article which describes the rise and career of the New York *Herald*, sets forth the causes of its success, and discusses journalism in general. What should be the aim of the journalist? Who of American journalists best understands his business and has been most successful? These questions the reviewer asks and answers. The news, "it is that which constitutes the value and power of the daily press." The work of a journalist is to collect and print the news; editorials are his play. Editorials, though Burke should write them, or Macaulay, add nothing to the circulation or income of a paper.

The *Herald*, the reviewer says, has always far excelled its contemporaries in this true work of a journal.

The *Herald* has had no political convictions, no intimate connection with any party, and its version of the news has been nearly or quite undistorted and uncolored by partisanship.

It is the *Herald* which among American journals commands the greatest sale and which has attained the first place in point of "circulation, income, and power," and this success is due to its being the best newspaper. Its want of morality is scandalous; its editorials are disgraceful on account of their scurrility, insincerity, and weakness; but its news-columns best meet the requirements of the ideal standard of

news-columns. They are "fullest, promptest, and most correct on the one uppermost topic of the hour."

Now, are these general and particular statements wholly true? or are some of them not true, and some of them only to be received with important modifications? Let us see.

The rivalry of the newspapers reached its height during the rebellion, for it was then that the people were most eager for news. Then, if ever, the *Herald's* news should have been "fuller, prompter, and more correct" than what was furnished by the other journals. And certainly if we take the whole four years together, its reports were fullest, though even in this respect it was not infrequently beaten by its competitors. But the fulness was very often obtained at the expense of correctness. Its numerous reports were furnished by a large number of special correspondents, who either must have been fourth-rate reporters, selected at hap-hazard, or else they had been spoiled by the influence of "that exquisitely absurd custom" which the reviewer speaks of. Unless they were paid by the column and thus received a premium on verbosity, they would never have sent despatches so ill-digested, so full of confused details, so often self-contradictory, and contradictory of each other, and utterly perplexing to the reader.

So far as concerns promptness, the great number of the *Herald's* retainers gave it no marked advantage. The rules of the Associated Press and the fact that the telegraph was controlled by the Government put all the newspapers on an equality. Other papers, more trusted and better liked by the Government officials, got more favors from them in the way of special information than were ever shown the *Herald*. In the matter of publishing war news, then, the praise of superior fulness is all we are willing to concede to that paper. It is too much to say that in promptness it was superior to the *Times*, the *Tribune*, or the *World*, and in correctness it was, in our opinion, considerably the inferior of each and all of them.

Their system was not like that of the *Herald*. At every important point they kept a few capable reporters, subordinate, usually, to some one clever writer and observer. They aimed to present one early, comprehensive, graphic narrative of each noteworthy event, and generally refused to stuff their columns with the conflicting accounts of four or five bungling penny-a-liners. So from them we had more than one series of reports which were at once interesting and accurate, and which have since been found not valueless as authorities. It is unnecessary to mention names now before the public; three, at least, of these correspondents are in receipt of handsome incomes from the sale of volumes made up of their letters. We recollect only one *Herald* reporter who at all approached the standard of excellence which they established.

It was thus during the war, and before the war it was not different. In chronicling such matters of general interest as the trial and execution of John Brown, the journey of the Prince of Wales, the doings of the Japanese embassy, the *Herald* was, on the whole, outdone by its competitors. And we believe it to be true of the *Herald* at the present time that, while in the single department of Spanish-American news it is unequalled, in the important matters, in European and domestic intelligence, it has been beaten. As a general thing, the popular impression to the contrary has no better foundation than the incessant assertions of the *Herald* itself.

Next, as to the alleged impartiality of this journal's reports. It is well known that all the New York morning papers receive precisely the same matter from the Associated Press, and that by the press rules they can receive "special" only from Albany and Washington. It is in the special despatches from these capitals, therefore, that we must look for any superiority in point of impartiality. Will anybody deny that a strong partisan bias has always been as visible in the *Herald's* despatches as in those of almost any other paper? Even the reviewer, we think, will not be indisposed to make this admission, for although throughout the article he asserts, both directly and by implication, the impartiality of the *Herald*, yet we find him at last confessing "that journalism pure and simple does not exist in New York during a session of Congress." The topic uppermost in the minds of the people since the war closed has been the method of reconstruction. Have the telegrams and the Southern letters of the *Herald* had no decided leaning? It will not do to reply that the *Herald* has no convictions. The *Herald's* want of convictions somehow always puts it on the side of the strong against the weak; of privilege against the oppressed; makes it hate the slave and respect the slaveholder; makes it jeer at every reform. Its articles scoff at everything that is inherently respectable, and its reporters do their best to follow the copy set them. Furthermore, despite what is said of Mr. Bennett's antipathy "to" the church in which he was born, and his frequent gibes at its peculiarities, it is daily evident that his paper is the great secular organ of the Romish faith. Probably it would be within the bounds of truth to say that a large proportion of its editors are Catholics, and everything pertaining to the interests of their church is carefully watched and reported. Such, be they good or bad, are the convictions which govern this sheet. If the reports which we read in the *Herald*, and which, as it seems to us, are prepared by the same class of men and for the same class of men that read the editorials and believe in them—if these things are the unbiassed reports of our newspaper millennium that is to come, we only hope, and, moreover, we can firmly believe, that its coming is far off.

Editorials, the reviewer says, do not influence many minds nor change many votes. Yet he shows that the *Times* was "the monarch of Great Britain," by reason of the editorial ability purchased by its manager; it might even have stopped the Crimean war, he thinks; and it is only because the telegraph has prevented centralization that we, nowadays, are saved from a similar tyranny. "The power of the editorial lessens," he says, "as the intelligence of the people increases. The prestige of the editorial is gone." The first of these statements may be true, though we disbelieve it; but even if it were true, the second would not necessarily follow. As the intelligence of the people increases, the intelligence and honesty of the editorial must increase also; that is all. A good editorial is the earnest address of an exceptionally able and an exceptionally well-informed man to some fifty thousand, more or less, of his fellow-citizens. A specimen of the good editorial is one of those trumpet-blasts, as somebody calls them, which the *Tribune* blows just as the armies of electors in some neighboring State are about to join battle at the polls. These things can never go out of fashion, for they can never lose their use. The London *Times* is losing its supremacy in England not, as we might suppose, because the governing classes in England have grown too intelligent to follow its leading, but because a class of cheap papers has come into being whose editorials create and confirm a class of opinions that are opposed to the opinions which the *Times* maintains. When the world gets to be so intelligent that no man shall be more intelligent than any other man, and no man shall be swayed by his passions and interests, then there will be no need of editorial expressions of opinions, and editorial arguments and appeals will lose their power. True, the editorials of the *Herald* do not influence public opinion outside of New York, nor change votes; but the inference which we draw from this fact is not the inference drawn by the reviewer. It is not flattering to the population of New York city. We should say that the number of people here who resemble the reviewer's description of his favorite editor is only too great. There are plenty of people here in whom the moral element is lacking. The *Herald* is read by a class who cannot, in any proper sense of the word, be said to have opinions, who care nothing for opinions, who are, nevertheless, quite capable of forming the most bitter prejudices and of liking any person or party or paper that will pander to them. Therefore the mixture of balderdash and buffoonery of which the *Herald's* comments on public affairs are composed is just as welcome to them as if it was the essence of logic, scholarship, and humor.

The *Tribune*, on the other hand, has actually formed the political opinions of the great bulk of the country population of the Northwest. People read it by the twenty thousand not for the sake of the news—the telegraph and the local newspapers give them that—but to see what its editors feel and think. The *Times*, too, is a real power through its editorial comments. They make a strong impression on conservative Republicans, and do change votes. It is only the other day that its support of English came very near giving him the Connecticut election. We differ widely from the *World* on almost every question, and think very poorly of its morals, but it has a genuine

weight with a large class, and it owes that weight to the vigor, learning, and ability of its leading articles.

If the *Herald* is the most prosperous journal in America, it is such not because it is the best newspaper, but because it is published and finds most of its readers in a city where, unfortunately, too many thousand people are degraded and ignorant. If influence and not money makes success, it is the least successful journal in the country. Horace Greeley edits a hundred, yes, a thousand, newspapers in America where James Gordon Bennett edits one. In another article in the same number of the review, a more philosophical writer has stated clearly the ground on which newspapers, like most other enterprises, must base themselves: "There is no end to the sufficiency of character it can afford to wait. It cannot but succeed."

THE BOARD OF HEALTH AND THE GAS COMPANIES.

Amidst the serious facts with which they are surrounded, the highly respected members of the Board of Health must, if they are endowed with the sense of humor, feel it hard to school their faces to gravity in hearing the great nuisances defend themselves. In general, it is gratifying to observe the vested wrongs have made but a feeble fight. The butchers and the bone-boilers feel that the voice of society is against their pursuing their useful trades where they must be injurious. Besides, they are individuals; they are not corporations. It is only a grand incorporated criminal, great in its privileges, great in its dividends, greater in its stock and in its multitudinous *clientèle* of influential stockholders (to them "non olet") that can climb the height of comedy in its defence.

Here is a nuisance of the most gigantic description—a nuisance peculiar to New York—a nuisance that would not be for a moment tolerated in London, or Paris, or Boston. It assaults you in the inmost chamber of your house. You are waked in the morning, with your windows shut, by its intolerable breath; you eat sulphuretted hydrogen with your dinner, and you give it to your friends with your ices. You may sell your house in despair, and buy another a mile off, and before you have eaten a meal in it, there it is! "Sedet post equitem"—it gallops after you to the Park, and it poisons the air of the tenement-houses. *Pauperum tabernas regumque turres* in one. Well, this gigantic Mephitis is called before its judges—and what does it say? That it would be "*commercially imprudent*" to confine itself to such coal as would be inoffensive! Commercially imprudent! How all the combined nuisances of New York must have clapped their hands when they heard that phrase—the magic word which should save them all! Commercially imprudent, we should think! And how about the bone-boilers? Will it not be "commercially imprudent" for them to remove? And how about the "commercial imprudence" exacted of that useful class of our citizens who sell bad rum, as these burn bad coal and sell bad gas?

"We prefer," continues Mr. Adams, controller of the Manhattan Gas-works,—"we prefer rather to stimulate the prosecution of mining [is that the object for which they were chartered?] by all companies, making it for the interest of those colliers whose mines yield only a quality of coal containing a large portion of sulphur to mine at greater depths and bring up coal of better quality." Admire the respect evinced for the capacity of the judges in this logic! "They prefer" (a second admirable phrase),—"they prefer" to use bad coal in order to encourage the colliers to furnish them better! Or do they mean to burn up all the bad coal as fast as possible, that there may be only good left in the world? By the smell the last week we incline to the latter interpretation, and they must be making rapid progress. It is remarkable not to note any reference to the excellent health of the owners of gas stock in proof of the salubrious nature of the odor. But probably that argument was used up by the butchers.

Professor Torrey, though he does not aspire to the first part, is what the musicians would call a useful second. It is well put that "the use of cannel coal might modify, but could not entirely remedy, the evil;" the inference being that it is not worth while to try to "modify." Some allowance must be made for the gas companies in the fact that they seem honestly to have come to look upon the public as their natural enemies; at best a troublesome and most unreasonable public not to swallow its nice gas and be quiet. Mr. Torrey is a rash promiser, unless we take into account the enormous size of his "if." "If," he says, "within a week our experiments prove successful, every gas-house in the city can be made inoffensive before the first of June." There is not the slightest doubt that every gas-house in the city *can* be made inoffensive before the first of June, and a few more such "experiments" on the patience of the Board of Health will no doubt conduce materially to the result.

THE IMPORTANCE OF KNOWING ONE'S BUSINESS.

The military, naval, and civil services of every great power in Christendom with the exception of the United States have been in existence for generations; for generations, too, in which precedent was powerful; and now the public servants of foreign states have for their guidance in all possible conjunctures of circumstances an immense body of traditional usages and laws well-known to all. It is next to impossible, therefore, that an English admiral, a French general or minister, should not, upon all occasions, know the exact metes and bounds of his province of duty. Of course this has its inconveniences, and it is not hard to put them in a very ridiculous light. But "circumlocution office" and "red tape" are not phrases that can be accepted as giving an exhaustive description of that machinery, more or less complicated, but valuable, indeed absolutely necessary, which exactly divides and apportions to every official, high or low, his proper work.

Our public service in all its branches is a thing of yesterday. It is without traditions. We have some men who have grown gray in the various bureaus and departments, and we have a very few men whose fathers were in service before them; but as a general thing our officials are an exceedingly short-lived generation. Naval officers sometimes, and army officers very frequently, drop back into civil life; and as for the people who have places in other branches of the Government service, they hardly expect to keep them longer than eight years at the furthest. Public service is found to be no inheritance; and, indeed, it can hardly be called the business of anybody, though it furnishes employment now and again to great numbers of people. But it offers no man a career; it offers no man even the certainty of a livelihood. Its work, we may say, is done by a fluctuating crowd of individuals, while in European countries the various classes of officials form bodies that have almost the continuity and unity of corporations. Even if our public offices had well-settled laws and usages, they could hardly succeed in getting handed down so as to become traditional.

We have, therefore, no schools to teach thoroughly, and we have no class of men who are learning thoroughly, the difficult and most important business of managing the details of the Government. In diplomacy, in all our intercourse with foreign nations, we mainly depend on volunteers; in finance, in short, in everything but the officering of our army and navy, we get along as we can, and trust our honor and our interests to guardians and servants always untrained and often incapable in all respects.

It is no wonder, then, that every little while the country should be surprised at some new impropriety on the part of one of its public servants. The latest case is that of Commodore Rogers. He was sent into Chilian waters in command of our South American squadron, and his orders were to observe a strict neutrality in the war now going on between Spain and the South American republics. The Spanish admiral determined to bombard the city of Valparaiso. It was Commodore Rogers's duty to do one of two things—either to prevent the bombardment, or peaceably to afford such protection as he could to American citizens residing in the city. But he and the American minister, General Kilpatrick, take this very singular view of his duty in the premises, that although he alone would have no right to prevent the bombardment, yet if the English minister and the English admiral could be got to join with General Kilpatrick and himself, he would then be clearly right, or at any rate right enough, in forcibly resisting the Spaniard's demonstration. Up to this stage in the proceedings, neither our minister nor our fleet commander seems to have shed much honor on the United States public service. But the commodore goes a step further, and takes it upon himself to write a very singular despatch to the Secretary of the Navy. It deals with moral and international law, with the recent history of the South American republics, with the rights and duties of neutrals, with the commodore's opinion about the space of time in which the *Monadnock* could destroy the *Numancia*, and all with such a pleasing air of authority and such an unconsciousness that the writer is meddling with matters which are no concern of his and of which he is wholly unqualified to treat, and finally, the last paragraph suggests so amusing a picture of the learned commodore and the gallant minister bringing their minds to bear upon

Wheaton and the other authorities, searching out instances and the same, when found, making a note of, that we are almost inclined to forgive the writer for sending the despatch and the secretary for letting it get into print.

Commodore Rogers is as brave and able an officer as there is in the world, but this very fact may have much to do with making him a very poor publicist, and such he evidently is. The qualities which make a man a good admiral are rarely those which make a man a good secretary of state. It is time, however, for officers, both naval and military, to learn that they were made officers for certain definite purposes, among which purposes the arguing of political questions and nice points of constitutional and international law has no place whatever. It is easy to recollect other glaring instances of the same fault. General McClellan at Harrison's Landing, of all places in the world, saw fit to write President Lincoln a letter of advice as to the best manner of carrying on the war, the proper course to be pursued in regard to emancipation, the composition of the army, and other matters of public concern. In 1862 all this was hardly laughable, but the absurdity of it was very apparent. Then, afterwards, there was Sherman's truce with the rebel army, in which that commander seemed to think that he combined the powers of a victorious general and of the United States Congress. Before that we had the *Trent* affair, in which Commodore Wilkes ventured to expound the rights of neutrals and belligerents, and, as payment for his pains, lost both the vessel which he might have taken and the prisoners which he took.

But the list of cases that are well known would not be a short one. It is very evident that in the management of public business upon the present system there is a lack of thoroughness, a lack of dignity, and, more than that, a continual danger that some ill-instructed, incapable representative of the Government, by meddling injudiciousness or ignorance, will involve us in quarrels that can neither be prosecuted nor abandoned with credit.

Correspondence.

PISCICULTURE.

To the Editor of the Nation:

The article upon pisciculture which appeared among the scientific notes of your issue of the 26th ultimo suggests the query, whether in seeking to re-stock our rivers with the salmon, shad, and alewives with which they were originally filled, legislators and commissioners are not paying undue attention to a specious argument; whether, in short, they are not following a sub-aquatic will-o'-the-wisp, and so taking no head of real lights.

In consequence of the establishment of human societies upon their banks, the rivers of to-day are no longer the salmon-haunted streams of the Pilgrim fathers; they are now no longer capable of supporting precisely the same forms of animal life as then. Clearly, therefore, in seeking to stock these altered rivers in a permanent and natural way (and it may safely be taken for granted that no system can be permanent if it be not in harmony with the actual surroundings), we must look for fishes differing from the old salmon and shad as much as the rivers of to-day differ from those of the last century.

The only pertinent argument for re-stocking our rivers with fish is, of course, based upon the fact that these would furnish a certain amount of food to the community. Now, any given river is capable, by virtue of the shell-fish, worms, insects, and vegetable growths which are to be found in it, of producing annually a certain number of tons of fish fit for the use of man. In the old time, when the salmon had the right of way, there may have been comparatively small chance for the growth, or even for the appearance of many other of the less rapacious species of fish; but now that the course is well-nigh clear, there would appear to be a wide field for the introduction by man of, so to say, domesticated fishes of such kinds as have no need to pass over dams, and are in other respects adapted to the requirements of the case. There are certainly such fishes to be found by searching. The Chinese, in particular, who have long since carried the art of pisciculture to a high degree of perfection in a climate similar to our own, could doubtless furnish us with a number of available species.

It might be necessary to feed some of these artificially-introduced species during the winter months, but the process of feeding would probably be far less costly and less detrimental to the community than the interferences with manufacturing establishments which are now recommended by some persons for the sake of a few salmon. Moreover, there are some species of fish which hibernate during the months when food is scarce, and several of these would probably be found well suited to portions of our rivers.

Pimelodus.

NEW BOOKS,

JUST READY AND PUBLISHED BY

CHARLES SCRIBNER & COMPANY,

REMOVED TO

654 BROADWAY, between Bleecker and Bond Streets, New York.

I.

LIFE OF BENJAMIN SILLIMAN, M.D., LL.D.,

Late Professor of Chemistry, Geology, and Mineralogy in Yale College, Founder and Editor of the "American Journal of Science and the Arts," etc., etc. By GEORGE P. FISHER, Professor in Yale College. 2 vols., crown 8vo, with fine portrait and other illustrations, cloth, $5.

This work is, to a large extent, compiled from the copious reminiscences which Professor Silliman wrote in the last years of his life. It embraces a detailed record of the rise and progress of the departments in Yale College, which, during half a century, were under his care, and is, indeed, a full record of his public labors and personal history, including his intercourse with eminent men. Besides Professor Silliman's own letters, the work contains many interesting letters from his correspondents at home and abroad, including Chancellor Kent, John C. Calhoun, Robert Y. Hayne, J. Fenimore Cooper, President Hitchcock, Josiah Quincy, Humboldt, Carl Ritter, Agassiz, Lyell, Murchison, Herschel, Mansell, etc., etc. In the Appendix are printed very important letters from General Washington, and also letters from John Adams, Lafayette, and others, addressed to the members of the Trumbull family.

II.

TWO NEW VOLUMES (5 and 6) OF

FROUDE'S ENGLAND.

HISTORY OF ENGLAND, FROM THE FALL OF WOLSEY TO THE DEATH OF ELIZABETH. By JAMES A. FROUDE, M.A., of Exeter College, Oxford. From the Fourth London Edition. In crown 8vo, 8 vols.; price $3. (The other two volumes will follow shortly.)

Mr. Froude has shown in his admirable history what new results may be derived, even in the most beaten track, from a thorough investigation of the original authorities. His researches have thrown a flood of light over the personal character of Henry the Eighth and his relation to the great event of modern history—the Reformation of Religion in Europe and the British Isles—that it would be in vain to seek elsewhere.

III.

SECOND VOLUME OF

LANGE'S COMMENTARY.

SECOND VOLUME OF LANGE'S COMMENTARY, containing MARK, edited by Rev. Dr. W. G. T. SHEDD; and LUKE, edited by Rev. Dr. P. SCHAFF, and Rev. C. C. STARBUCK. 1 vol., royal octavo. $5.

We are now printing the sixth thousand of the first volume of this work, containing MATTHEW, *edited by* Rev. Dr. P. SCHAFF.

These volumes contain one-fourth more matter than the original. Other volumes of the Commentary are already in course of preparation by the editor and the Rev. Drs. Schaffer, Poor, Little, Hackett, Yeomans, Kendrick, Mombert, Starbuck, Day, Hurst, and Tayler Lewis. Each volume *will contain one or more books, and thus be complete in itself.* Price, per volume, $5.

IV.

TEMPERANCE:

RECOLLECTIONS, LABORS, DEFEATS, TRIUMPHS.

AN AUTOBIOGRAPHY. By Rev. JOHN MARSH, D.D., Secretary to the three first National Temperance Conventions, and thirty years Corresponding Secretary and Editor of the "American Temperance Union." 1 vol., 12mo, $2 25.

Dr. Marsh has been more conversant with the Temperance cause from its commencement than almost any man now living, and has himself, as Secretary of the National Society, been immediately connected with all the most interesting events. The object of this work is more especially to give an account of what he has been an eye and ear witness of himself, even from his boyhood; at the same time he has given a good account of the general progress of the work in the world. General Cary, of Cincinnati, head of the Order of Sons of Temperance, writes to Dr. Marsh, April 23: "I am greatly delighted at the prospect of your making another contribution to our temperance literature. No man is more competent, as none can bring to his aid such a ripe and rich experience."

V.

A NEW VOLUME, PART II.,

OF

STANLEY'S JEWISH CHURCH.

LECTURES ON THE HISTORY OF THE JEWISH CHURCH, FROM SAMUEL TO THE CAPTIVITY. By A. P. STANLEY, D.D., author of "Sinai and Palestine." 1 vol. 8vo, maps and illustrations. Price $5.

From the London Athenæum.

"Dean Stanley's recent Lectures on the Jewish Church have the same conciliating qualities as the old, now familiar to many readers. From the sacred books, and from his own knowledge of Palestine, he tells the grand old story again; peoples the fields of Bethlehem with reapers, fights the battles of David, reviews the glory of Solomon, traces the great schism in Jewry, down to the days when the pastoral and warlike tribes were carried away captive. It is a bright and wonderful story; told by Dean Stanley much as the substance of Shakespeare is told by Charles Lamb."

Also, New Editions of

LECTURES ON THE HISTORY OF THE EASTERN CHURCH. With an Introduction on the Study of Ecclesiastical History. By A. P. STANLEY, D.D. 1 vol. octavo. Price $4.

PART FIRST OF LECTURES ON THE HISTORY OF THE JEWISH CHURCH, FROM ABRAHAM TO SAMUEL. By DEAN A. P. STANLEY. 1 vol. octavo. Price $4.

VI.

NEW BOOK BY C. L. BRACE.

SHORT SERMONS TO NEWS-BOYS;

WITH A HISTORY OF THE FORMATION OF THE NEWS-BOYS' LODGING-HOUSE. 1 vol. 16mo. With Illustrations. 350 pages. $1 50.

This volume is designed for Sunday-schools and Mission Schools, and similar institutions, and to furnish that most difficult material, Sunday home reading for children in families. The first part contains an account of that singular class, the street-boys of New York, and their temporary home, the *Lodging-House.*

The Sermons are familiar religious talks on subjects interesting to all children, interspersed with allegories and illustrations, and, in connection, are given incidents in the lives of the news-boys.

VII.

New Book by the late Mrs. C. M. KIRKLAND.

PATRIOTIC ELOQUENCE;

BEING SELECTIONS FROM ONE HUNDRED YEARS OF NATIONAL LITERATURE. Compiled for the use of Schools in Reading and Speaking. 1 vol. 12mo. Price $1 75.

The aim of this book is patriotic. It is designed to store the memories of the children of our country, during the course of their education, with the thoughts and expressions once so potent as watchwords of freedom, and to keep alive reverence for our fathers, and gratitude for the prosperity and happiness they won for us. In addition to the specimens of early American Oratory, the book is enhanced in value by the introduction of some examples of the oratory and poetry which have been called forth by the events of the past four years.

Copies sent by mail, post-paid, on receipt of price, by C. SCRIBNER & CO.

JUST PUBLISHED.

I.

POETRY,

LYRICAL, NARRATIVE, AND SATIRICAL,

OF THE CIVIL WAR.

SELECTED AND EDITED BY

RICHARD GRANT WHITE.

An elegant 12mo vol. Price $2 50.

From The Nation.

Poetry of the War—not *the* poetry—as if Mr. White had gathered up either all the verse that was not poetry, or all the poetry that was not verse, which the war produced. His purpose was a different one from that, and a better; it was to select all that appeared worthy of preservation on any account. Merit has not been the only consideration. Verses that at all worthily or spiritedly celebrated any important event in the war, which expressed truthfully any mood of popular feeling, or which embodied any type of character, whether enduring or the transitory creation of the circumstances of the day, have been deemed peculiarly fit for this collection. The pieces have been culled from the kitchen and the flower-garden alike. Volumes, monthly and weekly magazines, daily papers, street ballads, have been ransacked, and the characteristic specimens have been put together in true democratic order. . . . We thank Mr. White for his collection, and his publishers for presenting it in such an attractive form.

From the Springfield Republican.

The Poetry of the War, arranged chronologically, will give to any careful reader a complete and graphic history of its progress. The whole purport and meaning of every battle, each stratagem, each defeat and victory, so smote on every heart throughout the loyal North, that the universal echoes rose and touched every ear. . . . There is something inspiring in this volume. It gives an idea of the tremendous rate at which the nation has been making history during the past five years.

II.

ECCENTRIC PERSONAGES. By W. RUSSELL, LL.D. 12mo, price $1 75.

III.

THE GRAHAMES. A Novel full of interest and talent. By MRS. TRAFFORD WHITEHEAD. 12mo, price $1 75.

IV.

THE ORDEAL FOR WIVES. A Novel. By Mrs. EDWARDS, Author of "Miss Forrester," etc., etc. 12mo, price $1 75.

Either of the above sent, post-paid, on receipt of the price by the publishers.

The American News Company,

119 and 120 Nassau Street, New York.

AN IMPORTANT AND TIMELY WORK.

THE SOUTH SINCE THE WAR;

AS SHOWN BY

FOURTEEN WEEKS OF TRAVEL AND OBSERVATION IN GEORGIA AND THE CAROLINAS.

BY SIDNEY ANDREWS.

1 vol. 16mo. $2 00.

The intelligence and care with which the writer made his observations, and the marked candor with which he states them, have been recognized by the critics. As a fair picture of the condition and sentiments of the people of the South, this book is a valuable contribution to the discussion of questions involved in "Reconstruction."

"The writer had very favorable facilities for learning the true state of feeling among the people [of Georgia and the Carolinas], and has presented the information he gained in a very interesting manner."—*Boston Journal.*

"There is no false bias observable in the writer's statements or descriptions. . . . The soldiers and their families will want this book."—*Providence Press.*

"Mr. Andrews has just the qualities for a traveller. Among the many books of its class, his work will attain a prominent place."—*Cincinnati Gazette.*

"Timely and full of interest."—*Chicago Journal.*

"He jotted down the political proclivities of the people as he heard them expressed, and leaves his readers to draw their inferences."—*Philadelphia Inquirer.*

"An honest report from the South."—*Springfield Republican.*

"The book will be greatly sought after by every one who wishes to obtain a truthful representation of Southern society."—*Hartford Post.*

*** Sent post-paid on receipt of price.

THE GALAXY.

THE NEW FORTNIGHTLY MAGAZINE.

WITH ILLUSTRATIONS BY THE BEST ARTISTS,

AND ARTICLES BY THE BEST WRITERS.

SECOND NUMBER NOW READY.

Price 25 Cents.

The gratifying reception accorded to the first number of the "Galaxy" has encouraged the publishers to increase its size by the addition of sixteen pages. This enlargement will enable them to give greater variety and interest to its contents, by affording room for the numerous attractive contributions that have come to them.

Among the contributors to the "Galaxy" thus far may be named Richard Grant White, Edmund C. Stedman, John Esten Cooke, Dr. W. H. Draper, Professor Pierre Blot, Rose Terry, Frances Power Cobbe, The Author of "Emily Chester," and others favorably known to the American public. These are but the advance guard of the company of authors whose assistance will be obtained to make the "Galaxy" without a superior in our periodical literature.

CONTENTS OF THE GALAXY,

FOR THE FORTNIGHT ENDING MAY 15.

I.—THE CLAVERINGS, continued (with two illustrations). By Anthony Trollope.
II.—IN THE HAMMOCK. By Rose Terry.
III.—THE MARCH OF THE CHOLERA. By W. H. Draper, M.D.
IV.—THE ART OF DINING (the first of a series on Cookery). By Prof. Pierre Blot.
V.—ARCHIE LOVELL (continued). By Mrs. Edwards.
VI.—UNBELIEF. By the author of "Emily Chester."
VII.—THE HOME OF VICTOR HUGO (with two illustrations). By General Cluseret.
VIII.—MISS CLARE. By Maria L. Pool.
IX.—FALLACIES OF MEMORY. By Frances Power Cobbe.
X.—SPOKEN AT SEA. By Edmund C. Stedman.
XI.—A STORY OF THE OPEQUAN. By John Esten Cooke.
XII.—NEBULÆ: Containing articles on Shakespeare's Birthday at the Century Club, The Machinery of Dramatic Criticism, Mr. Stedman's "Anonyma," A London Strike, The Society for the Prevention of Cruelty to Animals, etc.

Professor Blot on Cookery.

In the second number of the "Galaxy" is commenced a series of articles on Cookery, by Professor Blot, the well-known teacher of the art. These articles will be made of great practical value to every family. Besides many general gastronomical directions of essential importance, they will contain recipes and practical suggestions which must secure for them thousands of readers.

TERMS:

The price of "The Galaxy" is 25 cents a number; $5 for the year, of 24 numbers; $3 for the half year of 12 numbers. The yearly subscriber thus receives over 2,300 octavo pages, illustrated by at least 25 full-page engravings, elegantly printed on tinted paper, besides innumerable smaller illustrations inserted in the text. Specimen copies will be sent to any address on receipt of 25 cents. Address

The Series will be completed in 30 volumes.

The publishers will send any of the above works, post-paid, on receipt of the price.

FINANCIAL REVIEW.

Nation Office, Monday Evening,
May 7, 1866.

The week opens on an easy money market, call loans being 4 to 5 per cent., and first-class short date paper passing at 6 to 7 per cent. Money which ten days ago would have gone into the Sub-Treasury on deposit is now flowing into the brokers' offices.

Gold sold as high as 128⅛ on Friday. To-day it has touched 128¼, closing at 128⅜. Exchange sold up to 109⅝ for Saturday's steamers. It opens to-day at 109¼. In consequence of the advance in bills about $1,200,000 in specie was shipped on Saturday, a large portion of which was silver coin and gold bars. It is still cheaper to buy bills as a remittance than to ship gold, but unless the cotton and produce markets advance abroad, exchange can hardly fail to advance to the specie-shipping point early in June.

Stocks have been dull since we last wrote. The clique movements in Fort Wayne and Pittsburgh continue, and the price of both stocks is higher without any obvious cause. Governments are steady, and some of the sellers on options are covering their sales by purchases on this side. Western Union Telegraph has advanced from 58 to 64, on purchases for Western account. Canton and Northwestern preferred are both higher, on purchases by Wall Street cliques. Erie and Central dull.

The following table will show the course of the stock, gold, exchange, and money markets since our last issue:

	April 30.	May 3.	May 7.	Advance.	Decline.
United States Sixes of 1881	108	108¼	109	¾	....
5-20 Bonds, old	105⅞	101⅞ ex.c	102	⅛	....
5-20 Bonds of 1865	105⅞	101⅞ ex.c	102	⅛	....
10-40 Bonds	95	95⅜	95⅞	⅝	....
7.30 Notes, second series	101⅞	101⅞	102⅛	¼	....
New York Central	92⅝	92¼	92½	....	....
Erie Railway	73¼	73½	73⅝	⅛	....
Hudson River	110¼	110½	110¼	....	....
Reading Railroad	105¾	106¾	107⅛	¾	....
Michigan Southern	78¾	78	78	....	....
Cleveland and Pittsburgh	81	81¼	82	¾	....
Chicago and North-western	28⅝	28¼	29½	1¼	....
" " " Preferred	58¾	58½	61	2½	....
Chicago and Rock Island	122¾	123¾	125	1¼	....
P., Fort Wayne, and Chicago	98⅝	98⅞	100	1⅛	....
Canton	56	59½	58½	....	1
Cumberland	45	44¾	44¾	....	....
Mariposa	12½	12¾	13	¼	....
American Gold	126⅛	127⅛	128⅜	⅞	....
Bankers' Bills on London	108¾	109¼	109¼	....	....
Call Loans	5	5	5	....	....

Considerable excitement has been created by the failure of the Merchants' National Bank at Washington, which has collapsed, owing the Government some $600,000. The removal of Government deposits from national banks is seriously mooted.

The topic of the day is Senator Sherman's bill for consolidating the debt of the United States into a uniform five per cent. thirty-year bond, free from income tax. In financial circles, opinions are divided upon the subject. Few careful observers share the sanguine expectations of the senator that, under this measure, all the obligations of Government will shortly be gathered under one bond and funded at one rate of interest; but it is quite possible that, with judicious management, a commencement of consolidation may by this bill be inaugurated. The measure takes for granted, in the first place, that a 5 per cent. loan can be negotiated at par. If it cannot, there is an end of the whole scheme. There is something to be said on both sides of the question. On the one hand, the only 5 per cent. U. S. bonds afloat, the 10-40s, have never been at par since they were first negotiated, have been as low as 90, and are now, in a 4 to 5 per cent. money market, selling at 95½ to 96. Furthermore, the average rate of interest throughout this country during a series of years is much nearer 7 than 5, and it is questioned by many whether we have in the country enough accumulated capital to justify an average rate of interest even at the financial centres of 5 per cent. On the other hand, it is argued that the credit of this country, with its large income and increasing prosperity, should not rank below that of Great Britain, France, or Massachusetts; that the short 5-20 bonds are at a premium here, and are steadily advancing under a foreign as well as a home demand, and that hereafter, as the effect of the war passes away, and the resources of the South are developed under a system of free labor, capital from all parts of the world will flow hither for employment, and money will be as cheap here as in England. Let us assume—for the purpose of looking further into Senator Sherman's bill—that the latter view is the correct one, and that, at the right time this summer or next fall, a 5 per cent. thirty year loan can be floated at par.

The securities which it is proposed to absorb into this new loan may be classed under three heads:

1. Temporary obligations, consisting of deposits on call, say $131,000,000 debt certificates, say $62,620,000; compound-interest notes, say $167,012,000; in all, $359,632,000. If a 5 per cent. loan can be floated at par, these obligations can all be converted within a brief period, the deposits and debt certificates at once, and the compound interest notes before their maturity, by receiving them at their face value, with interest. Here the Government is master of the situation.

2. Seven-thirty notes, say $814,000,000. The case of these securities is very different. They are either payable in lawful money at maturity or convertible into 5 20 6 per cent. bonds, *at the option of the holder.* This option is fatal to Sherman's funding scheme, so far as these notes are concerned. For if 5-20s are not worth par when the 7.30s mature, holders will demand their money, and 5 per cent. bonds will not be salable at 95. And if 5-20s are worth par or a premium, holders of 7.30s will convert, and will laugh at an offer of a 5 per cent. when they are entitled to a 6 per cent. bond. Exemption from income tax (which tax, by the way, is said to be terminable in 1870) is worth about 30-100, or less than ⅓ of 1 per cent.; or, in other words, a 6 per cent. bond, subject to income-tax, yields more than ⅔ of 1 per cent. more revenue than a 5 per cent. bond free from income tax. There is, therefore, very little chance that the exemption will tempt any of the holders of 7.30 notes to forego their privilege to convert into 5-20s for the purpose of accepting new 5 per cent. thirty-year bonds. It is clear that the 7.30 notes will, as a rule, be converted on maturity, and that this portion of the debt will not fall within the control of the Secretary until the 5-20s created by the conversion are themselves redeemable, which will be on May 1, 1872, for the first series, and at various days in 1873 for the second and third. At those periods, if a 5 per cent. thirty-year bond can be sold at par, that portion of the public debt now represented by 7.30 notes can be converted into 5 per cents. We do not see how it can be done before.

3. Five-twenty bonds, amounting altogether to $745,780,000. Of these the old issue, amounting to $514,730,000, is redeemable next May; the second series, $100,000,000, in 1869; and the new bonds in 1870. It is clear that if, between this and May next, a 5 per cent. thirty-year loan can be floated at par, the Government will avail itself of its reserved right to redeem the old issue of 5-20s, and will do the same in 1869 and 1870 with the two later issues. But there is very little prospect of this becoming feasible until the bonds are redeemable.

To those ardent minds which are bent on seeing our heterogeneous debt neatly condensed this year or next into a United States consol, bearing 5 per cent. interest, this will seem very slow work. But it is hard to discover how it could be managed more quickly. History is full of instances of national debts being consolidated and the interest reduced. But these operations have generally been accomplished at the sacrifice of the creditor. Bondholders, failing to receive interest on their bonds, have compromised

with their delinquent debtor, and accepted 4 per cent. where they had been promised six, and had been actually paid nothing. England gave perpetual bonds in exchange for terminable annuities, and so secured a reduction of the interest charge. This country does not propose either to ask a compromise with its creditors, or to perpetuate its debt for all time. We cannot reduce the interest on our debt until it is within our control. We cannot ask any creditor of the nation to forgive us one cent or one week. And so we must wait patiently, and diminish our interest charge when we can.

FIRST CLASS FIRE INSURANCE

ON THE PARTICIPATION PLAN.

MARKET FIRE INSURANCE COMPANY

87 WALL STREET, CORNER OF JAUNCEY COURT.

CONDITION OF THE COMPANY.

ABSTRACT OF THE ANNUAL REPORT OF DEC. 31, 1864.

TOTAL ASSETS	$414,729 18
Viz.—Bonds and Mortgages	$134,672 00
Temporary Loans	92,630 00
Real Estate	10,000 00
100 Shares Mer. Ex. Bank	5,000 00
Government Sec., value	144,514 00
Cash on hand	18,042 34
Interest due	3,085 58
Premiums due	6,785 26
PRESENT LIABILITIES	$15,995
NET SURPLUS	198,733 26

This Company will continue, as heretofore, to insure respectable parties against DISASTER BY FIRE

At fair and remunerating rates; extending, according to the terms on its Policies, the advantage of the

PARTICIPATION PLAN OF THE COMPANY,

pursued by it for several years past, with such great success and popularity, and profit to its customers: whereby

(75) SEVENTY-FIVE PER CENT. (75)

of the Profits, instead of being withdrawn from the Company in Dividends to Stockholders, is invested as a "SCRIP FUND," and held for greater protection of its Policyholders; and Scrip, bearing interest, is issued to Customers therefor: thus, IN THIS COMPANY, those who furnish the business, AND PAY THE PREMIUMS, derive the largest share of advantages; and when the accumulations of the SCRIP FUND shall exceed

FIVE HUNDRED THOUSAND DOLLARS,

the excess will be applied to PAY OFF the Scrip IN CASH in the order of its issue.

☞ The liberal and prompt adjustment of Claims for Loss, WHEN FAIR AND SQUARE, is a specialty with this Company.

NOTE.—This Company does not insure on the hazards of RIVER, LAKE, or INLAND NAVIGATION; confining itself strictly to a legitimate FIRE INSURANCE BUSINESS.

THE BEST SEWING-MACHINES IN THE WORLD.

THE WEED MACHINES,

With all their valuable improvements, entirely overcome all imperfections. They are superior to all others for family and manufacturing purposes, simple in construction, durable in all their parts, and readily understood. They have certainty of stitch on all kinds of fabrics, and are adapted to a wide range of work without change or adjustment, using all kinds of thread. Will hem, fell, bind, gather, braid, tuck, quilt, cord, and, in fact, do all kinds of work required by families or manufacturers. We invite all persons in search of an instrument to execute any kind of sewing now done by machinery to inspect them, and recommend all parties engaging in the sale of sewing-machines to make sure they secure the best by examining the WEED before purchasing. They make the shuttle-stitch, which cannot be excelled for firmness, elasticity, durability, and elegance of finish. They have received the highest premiums in every instance where they have been exhibited in competition with other standard machines. The company being duly licensed, the machines are protected against infringements or litigation.

Reliable agents wanted, to whom we offer great inducements. Every explanation will be cheerfully given to all, whether they wish to purchase or not. Descriptive circulars, together with specimens of their work, will be furnished to all who desire them by mail or otherwise.

Saleratus.—B. T. BABBITT'S SALERATUS, 70 Washington Street, N. Y. If you want healthy bread, use B. T. Babbitt's best medicinal Saleratus, made from common salt. Bread made with this Saleratus contains, when baked, nothing but common salt, water, and flour. B. T. BABBITT, 64, 65, 66, 67, 68, 69, 70, 72, and 74 Washington Street, N. Y.

THE NATION

Was, when started, essentially an experiment. Journals of a similar character had been tried and had succeeded in Europe, but the idea that there was enough interest felt here in literature or in art to support a paper mainly devoted to the discussion of literary and art topics, or that there existed what economists call an effective demand for any more careful or more general discussion of political news than writers of the daily press working between dusk and dawn were able to supply, was scouted by many. Our experience, so far as it has gone, satisfies us that it is this want of faith rather than want of appreciation which is the greatest difficulty which any such journal has to contend with here. Thousands enjoy it for the one who believes that his neighbors will enjoy it, and, of course, any very widespread doubt of its success increases the difficulty of succeeding.

For the guidance of those who may feel disposed to assist us with their contributions, we may mention that the contents of THE NATION will fall nearly under four divisions—or that, at all events, these divisions would have to be kept in mind by anybody writing for it as a volunteer.

1. References to, and concise comments on, the news of the day, with the view of fixing the degree of its importance, and suggesting its bearings upon and relation to the main current of contemporary history.

2. Reviews or comments, whether in the shape of letters or articles upon important events, and upon the utterances of those who are, or are trying to be, leaders of public opinion.

3. Accounts more or less detailed, or discussions of such occurrences in the social, literary, artistic, or scientific world as are likely to interest men or women of education and intelligence. Under this head we do not include mere gossip about nobodies, or advertising chronicles of the sayings and doings of quacks, daubs, penny-a-liners, dilettanti.

4. Critiques of publications or works of art of sufficient merit to make it desirable that the public should ever hear anything about them.

TERMS—$5 per annum; 6 months, $3.

When delivered by Carriers in New York or Brooklyn, $1 additional.

Topics of the Day.

Mr. Stevens admitted in the House, on Tuesday, that the plan of the Committee of Fifteen was not what he would have liked, but that he had accepted it as the best thing that nineteen States could be got to adopt—a rather remarkable concession to expediency to emanate from one of the most uncompromising worshippers of abstract right we have amongst us. Mr. Blaine, in a conversation which followed, knocked the bottom out (to use a homely phrase) of the third section of the constitutional amendment, by calling attention to the fact that the people whom it proposed to disfranchise had nearly all had their political rights restored to them by the amnesty proclamation, or had been pardoned by the President. This view Mr. Stevens concurred in, so that the amendment will probably now come before the country in a practical shape, and admit of serious discussion.

The Senate has passed the joint resolution congratulating the Emperor of Russia on his escape from assassination. Mr. Saulsbury, of Delaware, made a desperate effort to have the words ascribing the crime to "an enemy of emancipation" struck out, but was unsuccessful. There is, at this moment, perhaps, no more valuable life in the world than the Czar's, and we trust he will live to see the distinctions which he has effaced from the laws disappear also from the manners of his people. Freedom will speedily bring this latter result about; but even now the addition of sixty millions of freedmen to the working population of Europe is one of the most momentous economical, as well as social and political, facts of our time. If the empire was in a sufficiently advanced stage of culture to make it possible to offer settlers in it the same freedom that is enjoyed here, its immense tracts of unoccupied land would make it a serious competitor with us amongst the would-be emigrants of more powerful countries.

The Anti-Slavery Society has made its yearly announcement of principles and opinions. The resolutions declare that every political right of a citizen should be guaranteed to the negro; this we owe to him and to ourselves; now, with these rights denied, the negro is but nominally free; the Southern policy in regard to the negro is to be seen in the glass of Jamaica; as for the rebellion, it has not ceased; "once it fought, now it intrigues; once it followed Lee in arms, now it follows Johnson in guile and chicanery; once it had its headquarters in Richmond, now it encamps in the White House;" the President should long ago have been impeached; he has been guilty of gross usurpation in his manifest use of his high powers to aid rebellion; reconstruction should be based upon universal suffrage and universal amnesty; let the loyal people in each Southern State meet first, however, and prepare a State constitution that shall be republican; Congress deserves praise for passing the civil rights bill, but it stultified itself when Colorado was admitted with the word "white" in its aristocratic constitution; the defeat of the Union party in 1868 is better than compromises which sacrifice justice and fling the gains of the war away. The speaking at this year's meeting seems to have been hardly so good as usual, but of course Mr. Phillips made some effective speeches. He charged Mr. Seward and the President with planning to split the Union party because they saw that if it remained a unit the next President must be Grant.

The Legislature of Tennessee has just passed a bill which disfranchises every citizen who took any part in the rebellion or gave it any indirect support. It is provided that in every county of the State a commissioner shall be appointed who may hear evidence and who shall see that the law is executed. No suspected man may vote until he proves by two qualified voters that he has never committed any disqualifying act, and then he must take an oath affirming his loyalty and binding himself to conform to all the requirements of the amended State constitution. Of course such a law provokes the bitterest hatred of a large majority of the population, and is pronounced infamous, tyrannical, and unconstitutional. Thus a thing which, as a matter of policy, Congress hesitates to do, which it does not attempt to do without a preparatory amendment to the Constitution, the Tennessee Legislature has done without scruple.

The bill to encourage telegraphic communication between the United States and the Bahamas, Cuba, and other West India Islands, has received the signature of the President. Although it sanctions a monoply, the rights of Congress and the public have been carefully guarded, and the company may proceed without jealousy to lay their lines and reap their dividends. The fair prospect of the new Atlantic cable ought to stimulate their exertions. Both England and Spain will thank them for anchoring their colonies at their own door, as it were.

The Republicans of Connecticut, after much animated discussion, have nominated General O. S. Ferry as their candidate for Mr. Foster's seat in the Senate. Mr. Foster's long services and very respectable character pleaded for him as well as the fact that since the assassination he has been the acting Vice-President. He also had the endorsement of General Terry, whose own name had been mentioned as a candidate. But the left wing of the party were dissatisfied with him, and this nomination of General Ferry may be regarded as their triumph, and it seems not wholly without meaning as showing the ground occupied by the Connecticut Republicans. It will be remembered that even since the Hawley election and narrow escape from defeat, the Secretary of State and Lieutenant-Governor Winchester have declared that the course of President Johnson has been wholly satisfactory to them and the party.

Three or four days since, Secretary McCulloch, with a party of ladies, took a trip down the Chesapeake. He had not intended to go so far, we are told, but the weather was so fine that he got down to Fortress Monroe. Then, for what reason nobody knows, he paid a long visit to Jefferson Davis. The *Herald* correspondent, to whom we are indebted for these facts, suggests that the secretary merely wished to gratify his curiosity with a sight of the prisoner and "have a social chat with him as man to man." Nothing is known of what took place at the interview, but "it is to be presumed," the correspondent says, 'that many topics were discussed in which the shrewd, cultivated, and incisive vigor of their diverse minds and views shone out with brilliant effect." Very likely, too, Mr. Davis would betray a palpable eagerness to speak of his long imprisonment, his impaired health, and his eager-

ness to be tried, and no doubt Mr. McCulloch "would listen with mingled politeness and patience" to these diversions. As a bit of pure speculation, the above is interesting.

THE ship-builders' strike in this city, by which some 1,000 men of various trades are said to be thrown out of employment, still rages. Its object is the substitution of eight hours for about nine as a day's labor, but, as usual, the last thing the strikers seem disposed to concede in the matter is liberty to their fellows. Those who would rather work nine hours than eight are not allowed to do so, some thirty of them having been set upon by a mob of three hundred, and several severely beaten while at work. There is a touch of the comic given to these proceedings by the fact that we are asked to believe that the men who display this brutal disregard of their neighbors' rights seek more leisure in order to devote it to the cultivation of their minds.

PROBST, who murdered the Deering family, has told the story of his butchery with the same nonchalance with which the horrible deed was committed. The matter was a very simple one: he was in want of money, and he thought he could get what he wanted by murdering a former employer. When he found or believed it necessary to despatch also the entire family, he enlarged his determination without flinching, and would have killed them on their way down to breakfast if he had felt sure of succeeding. There is absolutely no trace of mercy or pity in the whole proceeding—hardly any of remorse, if that can be called remorse to which he alluded in saying "Yes" to the question whether he "felt bad" after the murder. One can scarcely imagine more inhuman apathy than was displayed by him in shaving himself with the razor of his chief victim, and then making a meal in the house. Yet, with an inconsistency which is remarkable, he supplied the horses in the stable with as much hay as he could before leaving the premises. The cunning of the man was as brutal as his action.

THE cholera makes no progress here, apparently, but the cold weather is now fairly over, and, if the pestilence is coming, we may now look for it very shortly. In England, the second outbreak is daily expected. The disease having already reached Rotterdam in its westward progress, the Privy Council has issued an order proclaiming its approach. In New York, despite some false alarms, there have been no well-ascertained cases as yet on shore, and the Board of Health is assailing the nuisances with imperial power and more than imperial vigor. Judge Barnard has "enjoined" it against removing some stalls on the sidewalk, but the injunction will probably fail very much like the fly on the cart-wheel. There is hardly anything the New York courts have not now issued injunctions against. Why not try the effect of one on the cholera? The most important part of the work the Board is now doing is the organization of a system of preliminary relief for the visitation of the poor and the discovery and treatment of cases in which only the premonitory symptoms have occurred. This is something which can only be thoroughly done by volunteers.

WE have received expostulations from some friends who misunderstood the duty undertaken by THE NATION on our presenting public criticism of the public acts of Mr. Stevens and Mr. Sumner, upon the ground that at this time it was better to overlook minor differences about means among those who have the same general purpose in view, rather than at anything which might lower the public confidence in their clear-sightedness and ability as leaders. That neither of these gentlemen takes this view of the matter is shown by some recent remarks of Mr. Stevens, in which he quotes Mr. Sumner as characterizing the course which he has himself felt it right to pursue, as "gross, foul, outrageous, with every other vulgar epithet which polished cultivation could command," and in which he accuses Mr. Sumner of "a perversion of philological criticism which if, when I taught school, a lad who had studied Lindley Murray had assumed, I would have expelled him from the institution as unfit to waste education upon."

CONGRESS.

WASHINGTON, May 9, 1866.

THE opening, in the House, of the discussion upon the Reconstruction Committee's constitutional amendment shows a greater degree of adhesion to the measure than was anticipated. The chief objections brought forward by Republicans were to the third section, which denies suffrage for representatives in Congress and for President to all lately engaged in rebellion, until the year 1870. This may yet be stricken out, and, if so, there is little room to doubt the passage of the remainder by the requisite two-thirds majority. Representatives have heard widely from the people as well as from the press, and assert a unanimity among the former which is not at all reflected in the voice of the latter. Outside the chief cities, it is alleged, the whole North will sustain the exaction of these guarantees.

The House has gone vigorously to work upon the tax bill, and is sitting to a late hour each evening to perfect its many details.

The Senate has fallen into the besetting sin of confounding the public business with electioneering speeches. The vexed question of the Federal patronage, as dispensed by the President, led to this, and a general political melée has followed, very amusing, but in the highest degree profitless.

DIARY.

Monday, May 7.—In the Senate, the reconsideration of the amendment to the Post-office bill, withholding payment from appointees of the President made to fill vacancies without consent of the Senate, was discussed by Messrs. Poland, Sherman, Stewart, Saulsbury, and McDougall against the amendment, and by Messrs. Howe and Trumbull in its favor. The amendment was reconsidered—yeas, 21; nays, 18.

In the House, Mr. Julian offered a resolution looking towards prohibiting any denial of the elective franchise in the territories on the ground of color; also, declaring that no State shall be hereafter admitted to the Union with a constitution making such denial. The House refused to table the resolution—yeas, 29; nays, 76—and it was referred. Mr. Boyer offered a resolution that the Committee on Reconstruction be discharged. Laid on the table—yeas, 100; nays, 24. A joint resolution to exempt crude petroleum from duty was passed. The internal tax bill was discussed by Messrs. Morrill and Raymond.

May 8.—In the Senate, Mr. Fessenden reported the legislative, executive, and judicial appropriation bill. The House resolution congratulating the Emperor of Russia and the twenty million serfs on his escape from assassination was passed. Also, the House resolution exempting petroleum from tax. The President's power of removal was again discussed at great length, on the amendment to the post-office appropriation.

In the House, the constitutional amendment reported by the Reconstruction Committee was discussed by Messrs. Stevens, Finck, Kelley, Schenck, Thayer, and Garfield. The two latter opposed the third section, which disfranchises until 1870 the participants in the rebellion. The tax bill was discussed at length, and amended.

THE FREEDMEN.

AMONG the recent cases of outrage reported to the Bureau are the following: In Lexington District, S. C., a negro was taken from his house, severely paddled, and shot in his left cheek and hand. All his furniture was burned. In Mecklenburg County, Va., an old colored woman, seeking to recover her grandchild from a planter, was obliged to procure the assistance of the agent of the Bureau, when the child was promised on her calling again. She went accordingly, and experienced the most brutal treatment, being knocked down repeatedly, dragged by a rope for some distance, and finally flogged on her bare back. At or near Louisa Court House, Va., a white man killed a negro who had done some work for him, and who was importuning him for his pay. The murderer was tried by a civil court, and the jury speedily found him "not guilty."

—We are without other particulars than those contained in a telegraphic despatch, of the doings of a mob at Meridian, Mississippi, which on the 4th broke into and sacked a building occupied by the Freedmen's Bureau, and then burnt it. It is also reported that at Grenada, in the same State, on the 30th of April, the general agent of the Bureau was foully murdered.

—The inspector-general of the Bureau, having thoroughly investigated the affairs of the freedmen in Virginia, makes on the whole a very satisfactory report of them. The various colored schools are well attended, and prejudice is slowly fading out. The sanitary condition of the freed people has so far improved as that all Bureau hospitals have been abolished, medical attendance being part of the labor contracts of the employers. Although the State had at one time a superabundance of laborers, the demand now greatly exceeds the supply. Males average $12 a month, including food, quarters, and medical attendance.

Notes.

LITERARY.

EXCEPT by those who have made the subject a special study, little is known of the collection of Jewish writings which goes by the name of "The Kabbalah," and which claims for itself the greatest antiquity and authority, as having been "first taught by God himself to a select company of angels," by whom it was communicated to Adam "to furnish the protoplasts with the means of returning to their pristine nobility and felicity." It is said to be the "Secret Wisdom," or "Doctrine received by oral tradition," and to have been transmitted by Adam, through the Patriarch, to Rabbi Simon Ben Jochai, which last personage, being condemned to death by Titus, escaped to a cavern, where he remained twelve years, occupying himself, with the assistance of the prophet Elias, in perfecting "The Kabbalah," the secrets of which were hidden till then in the first four books of the Pentateuch. The early Kabbalists reject this account as fabulous, and ascribe "The Kabbalah" to Rabbi Isaac the Blind, of Posquiers, who lived towards the end of the twelfth and the beginning of the thirteenth centuries, and who was called "The Father of the Kabbalah." The work itself, as we now have it, consists of three separate works: the "Jetzira," or "The Book of Creation;" the "Zohar," *i. e., light, splendor*, which was originally called the "Midrash," and the "Commentary of the Ten Sephiroth." The earliest of these, the "Jetzira," which pretends to be a monologue of the Patriarch Abraham, and to contain the reasons which led him to forsake the worship of the stars for the faith of the true God, is believed to have been a fabrication of the ninth century, or thereabouts, to supply a lost book of the same name mentioned in the Talmud, as the Book of Jasher is mentioned in the Hebrew Scriptures. The "Zohar," which professes to be a revelation of God to Rabbi Simon Ben Jochai, already mentioned, who lived about a century after Christ, and who, on his death-bed, communicated it to his disciples, is now considered by Steinschneider, Jellinek, and others, to be a fabrication of the thirteenth century. Its authorship, indeed, is pretty clearly proved against Moses de Leon, by whom the "Zohar" was first given to the world, and who died at Arevalo, in Spain, in 1305. Joseph de Avila endeavored to obtain the original manuscript after Moses de Leon's death from his widow, who declared that no such manuscript had existed, but that her husband, as he had admitted to her and her daughter, composed it out of his own head and wrote it with his own hand. She further confessed that she had often asked him why he had published his work under the name of another, and he told her that if he had published it as his own nobody would have bought it, while published as the production of Rabbi Simon Ben Jochai, it had paid him handsomely. The truth of this statement of Moses de Leon's widow is said to be confirmed by the fact of the "Zohar" containing passages from other works of de Leon's written in Spanish and extant still. The "Zohar" itself, which was written in Aramaic, and which circulated for a time in manuscript, was first published at Mantua, between 1538 and 1560. It may be described as being in the main a commentary on the Five Books of Moses. It is interspersed with dissertations which dilate upon the diverse doctrines of the Kabbalah in the oddest and most fantastic manner, affecting to find marvels of wisdom and mystery in the forms and ornaments of the Hebrew alphabet, in the divine names and the letters which compose them, and in the narratives and traditions of the Bible. The "Commentary of the Ten Sephiroth" was written by the Rabbi Azariel Ben Menachem, who was born at Valladolid about the commencement of the twelfth century, and who was a pupil of Isaac the Blind, "The Father of the Kabbalah." In the form of question and answer it explains the Kabbalistic doctrine of En Soph, which stands for the Deity, and of the Sephiroth, who are his emanations, begotten, not made, and both infinite and finite. From these Sephiroth, which are the archetypal man, were evolved the worlds which are their brightness and express image; and, later, all human souls, which are pre-existent, occupying a separate hall in the upper world of spirits, where they determine whether they will be good or bad while in their temporary abode in the flesh. The Kabbalistic doctrine concerning the soul is that, after developing itself on earth, it returns to the infinite source whence it emanated; and that when all souls shall have passed the period of their probation here, Satan will be changed to an angel of light, hell will be no more, and God will be all in all, the creator and the created one. The study of the Kabbalah produced several schools in Spain, the earliest of which, the school of Gerona, was followed by the school of Segovia, so called after its founder, Joseph of Segovia, who lived in the thirteenth century. Next came the quasi-philosophic school of Isaac Ben Abraham Ibn Latif, and the school of Abulafia, founded by Abraham Ben Samuel Abulafia. The cardinal doctrines of the Kabbalah were derived from the Neo-Platonic philosophy, a fact which accounts in some degree for the hold it obtained over the minds of Christians in the fifteenth and sixteenth centuries. Mirandola found in its cloudy utterance the chief doctrines of his church, and, at the request of Pope Sixtus IV., translated three commentaries upon it into Latin for the use of divinity students. He also brought it to the notice of Reuchlin, who wrote wo treatises in explanation of its mysteries and their interpretation—"De Verbo Mirifico" and "De Arte Cabalistica." A century later the study of the Kabbalah spread into Palestine and Poland, two schools arising in the former country, that of Cordovero, which occupied itself with the speculative Kabbalah, as it was called; and that of Loria, which dealt with the wonder-working Kabbalah. The last attracted the attention of the Jesuit Kircher, who published an elaborate work thereon for the use of Christians. About his time the Kabbalah achieved its greatest success and received its greatest defeat, both in the person of Sabbatai Levi, whose head was so turned by its mysteries that he proclaimed himself the Messiah, the Son of David, the Redeemer of Israel, and, being excommunicated for it at his birth-place, Smyrna, traveled to Salonica, Athens, Morea, and Jerusalem, teaching the Kabbalah, anointing prophets, and converting thousands. Arrested at last by the Sultan Mohammed IV., he was brought before him at Adrianople. "I am going to test thy messiahship," said the Sultan. "Three poisoned arrows shall be shot into thee; if they do not kill thee, I too will believe that thou art the Messiah." Rather than stand this test Levi recanted and embraced Islamism on the spot, to the ruin of his thousands of dupes. The influence of the Kabbalah declined among the Jews, and no wonder, since it now had the effect of converting many of their number to Christianity, chiefly men of the highest position in the synagogue, among others Paul Ricci, physician to Maximilian I., and Jacob Frank, a great Kabbalist, whose example was followed by thousands of his disciples. Such, in brief, is the history of this singular collection of pseudo-sacred writings which has lately been made the subject of an interesting volume published by the Longmans, "The Kabbalah: its Doctrines, Developments, and Literature, by Christian D. Ginsburg, LL.D."

—A number of Byron's letters, formerly in the possession of his friend Hodgson, to whom they were addressed, was lately sold in London. The first, which was dated Newstead Abbey, Nov. 3, 1808, brought twelve guineas. A second, dated some six years later, and interesting from its reference to Miss Milbanke, then about to become Lady Byron, realized £6 10s.; a third, £3 12s. In the last Byron desires Hodgson to inform Drury that he has a treasure for him—a whole set of original Burns's letters, never published or to be published, since they were full of fearful oaths and the most nauseous songs. "However," Byron adds, "they are curiosities, and show him quite in a new light. The mixture, or rather contrast, of tenderness, delicacy, obscurity, and coarseness in the same mind is wonderful." A volume of autograph letters of Mrs. Siddons brought at the same sale £31 10s.

—It is almost to be regretted that Shakespeare ever wrote the sonnets which have come down to us bearing his name, since they have occasioned such contradictory writing and profitless reading in the shape of comment and interpretation. The key of the mystery, if there be one, lies in the enigmatical initials W. H., which mean one person with one critic, and another person with another. The latest reading we have seen is that of a writer in "The Examiner," who contends that they stand for *William Himself!* His theory, for of course he has one, is, that the sonnets are an entire poem in two parts, the boy, or fair youth, of the first being a personification of poetry, or poetic genius, the woman of the last a personification of the drama, or dramatic genius. The first part of the poem expresses Shakespeare's religious love of poetry, the second his more familiar love of the woman, the whole being a psychological hymn, dedicated to the genius which inspired it. "The inconceivable skill," says this idealistic gentleman, "with which he has depicted his genius poetic, and contrasted it with his genius dramatic, holding himself between the two, bending in love which is almost idolatry before the one, and utterly against his conviction yielding in love to the other, is food for long astonishment." That Shakespeare is more of a poet than a dramatist—in other words, that the sonnets are superior to "Lear," say, or "Hamlet"—is astonishing, so astonishing, indeed, that no genuine Shakespearian will for a moment believe it. As regards the theory of the sonnets, that they are not autobiographic, it was first broached in Germany by Bernstorff.

—An instalment towards a complete ecclesiastical history is Prof. Döllinger's "First Age of Christianity and the Church," of which an English translation has just been published by Mr. H. N. Oxenham. It consists of two volumes, written in the soundest and most liberal spirit of German

Catholicism, the first treating of the ministry of Christ and his Apostles, and of the doctrine of the latter, while the second discusses the constitution of the Apostolic Church. It is a sequel to Prof. Döllinger's work on "The Gentile and the Jew," already translated by Mr. Oxenham, who dedicates his present translation to Dr. Newman.

—The latest issue of the "Golden Treasury" series is the world-famous "Robinson Crusoe," which has been so mutilated and modified since its first publication that its author would scarcely recognize it were he to revisit "this dim spot which men call earth." The "Golden Treasury" reprint, which includes the two parts, changes all this, the text being carefully printed from the original editions, even in the matter of spelling, which, however, is not archaic enough to be troublesome to the most modern of readers.

SCIENTIFIC.

Near and Far Sightedness.—Until recently "near-sightedness" and "long-sightedness" have been explained by assuming in the first case that, in consequence of the too great convexity of the cornea and crystalline lens, one or both, the focus is formed in front of the retina, while in the second the rays of light are concentrated behind the retina, because the convexity of the parts just mentioned is too small. The correction of these imperfections by the use of concave glasses in the first instance, and of convex ones in the second, seemed to be all that was needed to show that the explanation was true. It certainly had the merit of meeting the facts, and so has been almost universally accepted by physiologists, and has found its way into every text-book touching upon the optical structure of the eye. That these conditions, if they existed, would produce the effects indicated, no one will doubt; but it should not be lost sight of that the alleged conditions of the cornea and lens were never satisfactorily shown to be attendants of the two abnormal states of the eye of which we are speaking. Recent investigations have proved that both near and long sightedness may be, and in most cases are, the result of wholly other causes. A moment's reflection will make it apparent to any one that, the refracting media being quite normal, if, in consequence of the axis of the eye being too long, the retina is too far behind the lens, the rays will meet in front of this, and thus short-sightedness will of necessity follow. The average length of the axis of the eye is a little less than an inch, viz.: 24·25 millimetres, or about 0·95 inch. Donders has shown that in near-sighted persons it exceeds an inch, and may amount to 1·20 inch and even more, the other diameters being unchanged. In this case the ball of the eye becomes more or less oval or egg-shaped, and when turned strongly towards the nose will fill the orbit more than usual at the outer angle. Concave glasses will, of course, be required to disperse the light sufficiently to bring the rays to a focus on the retina. In proof that too great convexity of the cornea does not produce near-sightedness, may be urged the fact that this convexity is greatest in childhood, but, as Volkman observed, children are rarely near-sighted.

In regard to long-sightedness, if the alleged cause of it, viz., the flattening of the cornea and crystalline lens, existed, this would of necessity form the focus, other things being the same, behind the retina; but no proof was ever brought forward that this flattening actually did exist in the majority of cases. In adopting this explanation, its inconsistency with the fact that elderly persons still see far objects distinctly, seems to have been overlooked by physiologists. The persistence of this faculty was of itself sufficient evidence to make it probable that no *permanent* change took place in the form of the lens, since this would impair the eye for seeing objects at a distance, as well as those near at hand. Kramer and Helmholtz have shown that the accommodation of the eye to seeing near objects depends upon a *temporary* change in the form of the lens, this becoming more and more convex as the object approaches the nearest point of distinct vision. This is proved by watching the relative position of the three images of a candle as seen reflected, 1st, from the front of the cornea; 2d, from the foremost or convex surface of the capsule of the lens; and 3d, from the hindmost or concave surface of this capsule. The image from this last is inverted, and that from the front of the capsule is in the middle of the three. The attention of the person whose eye is observed being directed to a distant point, if it be suddenly changed to a near one, in the same straight line with the first, so that no motion of the globe of the eye will be necessary, the central image will change its size, becoming smaller, showing that the reflecting surface has become more convex, and at the same time will change its place to one side, showing that the front of the lens has moved forward. The first and third images undergo little or no change. It is the loss of this power of changing the form of the lens, a power necessary to the distinct vision of near objects, that chiefly gives rise to long-sightedness in persons growing old. The inability to accommodate, according to Donders, depends upon the lens becoming harder, and therefore less compressive, and so offering greater resistance to the ciliary muscle, the chief agent in producing the compression required.

When directed to distant objects the accommodating power is at rest, so that the sense of effort is wholly absent. Most persons are, however, conscious of a distinct effort, and those who are becoming long-sighted, painfully so, when the eye is directed to a near object. It is commonly believed that near-sighted persons as they grow old acquire the power of seeing objects at ordinary distances, because their too convex refracting media become flattened with advancing age. This may and does happen to a slight degree in a few, but not in the majority of cases. For the most part, near-sighted persons as they grow old find that the near point of distinct vision recedes, while the far point undergoes but little change. This is an important fact in opposition to the theory of flattening heretofore so generally accepted, and is fully explained by the loss of the power of accommodation.

EDUCATIONAL.

The Sheffield scientific school at New Haven is one of the institutions, like the Massachusetts Institute of Technology, Cornell University, etc., which receive their endowment in part from the national grant of public lands, bestowed for the promotion of instruction in agriculture and the mechanic arts. This school, however, is not a new affair, but has been in operation for nearly twenty years. The gentleman whose name it bears, Mr. Joseph E. Sheffield, of New Haven, has, within a short time past, added to his previous donations by enlarging, at his own expense, the building which he provided, re-arranging the interior and adding two towers, to be used for astronomical observations. The whole cost of these improvements is over $40,000. His earlier gifts amounted to over $100,000. In one of the towers a good telescope is to be placed, which is now making for the school by Clark & Son, of Cambridge. This instrument will be used to facilitate the study of astronomy, theoretical and practical, among the scholars, rather than in those constant and accurate observations of the heavens which special and well-endowed observatories maintain.

—Massachusetts still maintains the foremost rank in popular education. Abundant confirmation of this statement may be found in the official reports for 1865, recently presented to the Legislature of that State, and made public in an octavo volume of nearly five hundred pages. On the title-page of the volume there is a sort of aristocratic self-consciousness of "position" which is a little amusing. It reads: "Twenty-ninth annual report of *the* Board of Education, together with the twenty-ninth annual report of *the* Secretary of *the* Board," without any indication of the State, province, or "commonwealth" to which *the* report or *the* Board pertains. Does not every one know the equipage of the king? This annual report is a most important contribution to the literature or science of public education. Indeed, the series of which it forms a part, including the contributions of Horace Mann, Barnas Sears, George S. Boutwell, and Joseph White, has been of great influence in diffusing throughout the Union, and even in foreign countries, sound opinions and trustworthy statements respecting the administration of common schools. The report of the Board, which is always brief, was drawn up this year, as we learn, by Hon. J. D. Philbrick, Superintendent of the Public Schools of Boston. It states the school fund of the State as amounting to nearly two millions of dollars. The amount of money expended on common schools during the year was seven dollars and twenty-three cents for each person of school age. The average wages of male teachers was nearly fifty-five dollars per month; of female teachers nearly twenty-two dollars per month. About ninety per cent. of the children of the State are enrolled as scholars in the public schools. Mr. White, the present secretary, in addition to the customary administrative statistics and recommendations, gives an interesting historical view of the progress of the Massachusetts school system from the earliest days until the present.

—The number of college graduates and of other cultivated and educated men who took part in the recent war on the side of the Union was made the theme of some interesting comments by Thos. Hughes, in a recent English magazine, which were reproduced in "Littell's Living Age." The estimate which he placed on the high tone of our army was discriminating, and as the tribute of a liberal Englishman it was a gratifying acknowledgment of the aid which the educated men of the country rendered in the conflict which maintained the Government. But some American should collect in a more thorough manner the facts illustrative of the real influence which was exerted by this class of our countrymen. A contribution toward such an investigation will be found in a pamphlet lately printed under the very

vague title "The Commemorative Celebration at Yale College, July 26, 1865." This is really an account of an academic festival in honor of the former students of the university at New Haven who served their country in the recent war. In addition to a memorial discourse by Dr. Horace Bushnell, a most interesting list is given of the students from Yale who enrolled themselves among the defenders of the republic. The summary presents the following figures: The number of the graduates of the academical department who entered the national service was 454; of the professional schools, 97; total, 551; and the number of former students, *not* graduated, who entered the service, was 175 in the academical department; 32 in the professional schools; total, 207. The grand total, including graduates and non-graduates, was 758, of whom 106 have fallen by disease or in battle. The Yale battalion was more than decimated. It was estimated that about one-fifth of the living graduates of military age took part in the war. One class which graduated ninety-eight men sent thirty-nine soldiers to the army. The publication of the Harvard memorial volume is looked for with great interest.

—A sort of fraud has been perpetrated in one of our weekly illustrated newspapers by the publication of a large print showing the College of Business and Finance in a neighboring city. The edifice is represented as four stories high, and some two hundred feet long, while not an intimation appears in the letter-press that this is only a *château en Espagne*. We presume it will be found that not a foot of ground has been bought, nor a brick laid, for this dashing architectural venture.

—The recent death of three men who have long been identified with university education, and the expected publication of their memoirs, is likely to throw light on the influences under which the scholars of the present generation in this country have been trained. Prof. Silliman, Dr. Nott, and Dr. Wayland were as unlike in their character as the three institutions with which their names are indelibly associated. But all of them had great influence with their pupils and with the public, and their biographies will be an important contribution to the history of American colleges.

THE ARMY OF THE POTOMAC.*

Mr. Swinton's book differs in several respects from any previous work published in this country on the military events of the late civil war. It is the first *critical* history extending beyond the limits of a single campaign; the first assuming to be based on evidence furnished by both of the contending parties; and the first, so far as we know, in which an author has ventured to express opinions diametrically opposed to those previously entertained by him. Viewed in these several aspects it is a welcome successor to that mushroom crop of "histories of the rebellion" whose appearance was almost coeval with the report of the first gun fired against Sumter, and of which the greater part, loosely constructed, inaccurate, and colored by partisan feeling, cannot possibly survive a decade; not to speak of the equally numerous family of special narratives, diaries, etc., by army correspondents, or by an occasional staff officer of a literary turn. With rare exceptions these works were little better than offerings on the shrine of national vanity. It is possible that an historian purposing to employ such an immense mass of material as the author parades in his preface could make a faithful use of it within the brief space of time which Mr. Swinton has deemed sufficient; but such expedition implies an almost superhuman industry, and the reader may with reason enquire whether it is compatible with accuracy of statement or just criticism. Napier's history of the Peninsular War, the operations covered by which it will scarcely be pretended were more important than those of the army of the Potomac, cost him sixteen years of undivided labor. Mr. Swinton has hurried his book through the press within considerably less than a year from the time when the Army of the Potomac passed out of existence. Had he used less haste he might have modified many of the opinions to which he now stands committed, and produced a permanent and valuable addition to our military literature. In its present form the work cannot be so considered.

In his capacity as a critic the author has nevertheless acquitted himself with decided ability, and his judgment will in the majority of cases probably be considered sound. That he will also arouse against himself a storm of adverse criticism admits of little doubt. While showing at times prejudice and unfairness, or assailing opinions too fixed to be overthrown by such reasoning as he employs, and sometimes, we are compelled to say, suppressing, if not perverting, the truth, he has, on the other hand, laid bare with utter fearlessness the mistakes, the ignorance, the imbecility which characterized the conduct of the war at various stages. Considered as warnings against error in planning or managing future campaigns, his criticisms may serve a useful purpose; but when he intimates that, under the circumstances, another line of conduct could have been pursued than that which on more than one occasion proved so disastrous, he does injustice to the men who then controlled our Government and armies, and shows a disregard of human feelings and motives remarkable in so keen a dissector of character. When, for example, President Lincoln is censured for his reluctance to leave the Capital uncovered and his solicitude to have unimportant points guarded, the mitigating circumstances which impelled him to think and act thus are unnoticed. He had no military experience himself, and he had received no proofs that the generals around him had much the advantage in that respect. The military commander in whom the hope of the country centred, after permitting Washington to be beleaguered on one side by a greatly inferior force for more than half a year, now proposed to transfer the bulk of the army to a distant base, leaving, as it seemed, the Capital open to attack by the same enterprising enemy. That capital rested on the very confines of a hostile country, and the responsibility devolving upon the Executive to defend it was enormous in view of the moral effect which its capture would have upon the country. It was in vain to tell the President or the people that a demonstration against Richmond by the line of the James or the Chickahominy would protect Washington, for neither the Executive nor the public mind was as yet sufficiently instructed in military science to appreciate the truth of that strategic problem. At that early stage of the war, and under the circumstances then existing, the proposition was almost without a parallel, and that it should have been strenuously opposed was inevitable. The President and his advisers are nevertheless blamed for this as severely as if the maxims of war were not less familiar to them than when, two years later, Grant pushed the enemy before him to the James, and finally confronted him before the lines of Petersburg, thus leaving the capital uncovered. Is no account to be taken of the fact that within that period many a bitter lesson of experience had been gained, and that the President could comprehend in 1864 what it is unreasonable to suppose he could in 1862?

Again, when the sudden movement of Jackson down the Valley of the Shenandoah, in the spring of 1862, aroused fears for the safety of the capital, it was in the nature of things impossible for the President not to have taken such measures of defence as his maturer judgment would have convinced him were useless. No man in his position and having his imperfect experience would have done otherwise; and Mr. Swinton's bitter criticisms upon the useless diversion of McDowell's corps toward the Shenandoah, when his pickets had almost opened communication with McClellan's right wing before Richmond, are about as just as the censure of a child for an act which as a man he would never have committed. That Mr. Lincoln's order in this instance had an unfortunate influence upon the campaign admits of no doubt, but it will require more forcible arguments than Mr. Swinton employs to convince the majority of his readers that the error of the President was an unpardonable one. The odium connected with it should at least be shared by McClellan, whom, with a tenderness as marked as it must be unaccountable to those who remember the author's previous comments on this campaign, he studiously shields from blame. That general must have suspected, when he landed on the Peninsula and left Washington comparatively uncovered, that precisely such a diversion as Jackson made would be attempted against the Capital; and had he taken the trouble, by a very simple process of reasoning, to enquire what a man in Mr. Lincoln's position would do under the circumstances, he would have been prepared for precisely what happened, and still been master of the situation. It was very plain to him, certainly, that the advance of McDowell toward Hanover Court House should not be interrupted by Jackson's raid, and having made up his mind on that point, he at once determined that the conclusion must be equally obvious to the President. Just such short-sightedness marked his whole career as commander of the Army of the Potomac, and from this radical defect in his character it resulted that his plans were never thoroughly digested, and in consequence often miscarried.

In no respect is the book before us more remarkable than in its criticisms upon McClellan's military acts. Those who read the letters in the *Times* of 1864, may well rub their eyes and ask whether this is the same Swinton whose caustic pen exposed the disingenuous statements and the numerous errors of omission and commission which characterized McClellan's report. Transformed from a severe critic of the general's conduct into, we might almost say, his apologist, he labors in 1866 to prove him right in many instances where in 1864 he conclusively showed him to have been wrong. That he has changed his opinion of McClellan is nothing to the purpose—if he has done so from conviction, it is rather to his credit than otherwise—but

* "Campaigns of the Army of the Potomac. By William Swinton." New York: C. B. Richardson. 1866.

having thrown down the gauntlet to those who would impugn his judgments, by demanding that they should first impugn the reasoning on which these judgments are founded, he has invited a comparison between the letters in the *Times* and the present work on those points embraced in each. And we have no hesitation in saying that the conclusions arrived at in the former are in no instance overthrown by the facts or the reasoning in the latter—in other words, Swinton has failed to confute Swinton. It must not be supposed, however, that McClellan escapes in every instance without censure. His vacillating conduct on the Chickahominy, where he is aptly described as "halting in the perilous half-way house between the offensive and the defensive," and his failure to take advantage of Lee's rash concentration on the left bank of the river, and march, after the battle of Gaines' Mill, with his whole army upon Richmond, are commented upon in fitting terms. On the other hand, the retreat to the James River is characterized as reflecting credit upon the commander as well as the army. The narrative of the Peninsula campaign of 1862 is briefly but clearly told, but it is rather singular that the author makes no allusion to two circumstances which have been accepted as history, and in connection with which severe criticisms have been pronounced against McClellan. We refer to the alleged panic among the rebels after the battle of Fair Oaks, of which, it is asserted, advantage might have been taken by an energetic commander; and to a similar panic which, on the authority of rebel officers, prevailed among their troops after the bloody repulse at Malvern.

The unfortunate campaign of Pope in Virginia is described with no lack of vigor, but with a degree of harshness also which cannot fail to provoke replies from the parties chiefly censured. Pope himself comes in for the largest share of blame. His follies and mistakes are thrust forward in hideous relief, while not a word is said in extenuation of his acts, or in censure of that general who, after unpardonable tardiness in coming to the succor of a brother officer, coolly proposed to let him "get out of his scrape." Admitting that Pope was bewildered and outwitted by his wily adversary, it is equally clear that he might have averted defeat had he received the assistance which he was entitled to expect. Who that remembers the timely arrival of Sumner at Fair Oaks, after a weary tramp through mud and rain, or the forced march of thirty-five miles which in twenty-four hours brought the Sixth Corps to Cemetery Ridge, will doubt that if McClellan and his generals had been anxious to relieve Pope they could have done so? The difficulties under which the latter labored, and the incompetency, not to use a harsher term, of McClellan, are so elaborately set forth in Mr. Swinton's letters to the *Times* that we are surprised to find scarcely an allusion to them in the present work. Space will not permit us to review in detail other portions of the book. The campaigns of 1862 in Virginia have been selected chiefly on account of their remoteness in point of time, on the supposition that the narrative would be more accurate and also more free from bias or prejudice. In these respects the work has disappointed us, and, in fact, the nearer the author approaches the close of the war, the more full and trustworthy become his descriptions. Antietam, Fredericksburg, and Chancellorsville seem each an improvement upon the other, and Gettysburg is described with a vigor surpassing any previous effort. As he is of the opinion that McClellan ought to have attacked Lee on the day succeeding the battle of Antietam, so, between the retreat of Lee from Gettysburg and his return into Virginia, it is also his opinion Meade should have attacked him. These have been heretofore moot points, but the reasoning of Mr. Swinton seems to us very sound. In describing the campaigns of 1864–5, he runs counter to some very fixed opinions about men and things, but is less swayed by prejudice. When, however, he says that Sheridan's devastations in the Valley of the Shenandoah were not less complete than those of Turenne in the Palatinate, he does injustice to the former general.

With the exception of Pope and Halleck, for whom he seems to have a cordial dislike, Mr. Swinton has spoken with tolerable fairness of the prominent generals of the Army of the Potomac, some of whom are characterized in exceedingly apt terms, a dozen words often sufficing to depict a man to the life. Grant and Meade are assigned to a considerably less exalted position than they occupy in the public estimation; while Hancock and Warren are praised without stint. The former certainly proved himself a gallant and capable officer; but that the victory of Gettysburg was due to his exertions and dispositions, as Mr. Swinton would seem to imply in his narrative, we are not prepared to believe. To the Army of the Potomac itself, the rank and file, often sorely tried by incompetent leaders; often subjected to loss of *morale* by change of leaders, but never discouraged, never refusing to respond to the commands of its leaders, the author renders full justice; and, in this regard, his work ought to meet the approbation of all classes of readers. Not so, however, the manner in which the oral statements or reports of rebel generals are made to substantiate the narrative. This sort of testimony is valuable when used in its proper place—without it, indeed, many occurrences happening within the special observation of the rebels could not be properly explained; but where we have the evidence of our own generals on matters cognizable by both parties, it seems odd, to say the least, that Mr. Swinton should choose to refer, in the majority of cases, to rebel authorities. If he does so from a desire to be scrupulously fair to our opponents, the motive is a laudable one; but the result is that, in avoiding Scylla, he is very apt to strike Charybdis. The unfavorable aspect in which several battles, hitherto esteemed Union victories, are placed before the reader may be accounted for by the author's familiarity with rebel reports, and his reverence for the opinions of Generals Longstreet and Johnston.

The "Campaigns of the Army of the Potomac" are too purely a military history to interest the general public. The language is to a considerable degree technical, and much space is devoted to details which only a military man can fully appreciate. Nor is the style by any means a model, being at times careless and even obscure, while here and there odd words crop out, for which the author is indebted to his own invention. "Supersession" is, we believe, allowable; but "disillusionized," "positioned," "oncoming," "ongoing," "unshaked," etc., are simply detestable. Believing, also, that a rebel is a rebel, some may not relish the euphuism which seeks to hide the character under the unrecognized term "Confederate," uniformly employed by Mr. Swinton. These, however, are comparatively slight faults, which can always be corrected. As a history of some of the most important operations of the war the book has great merit, though, as we have shown, it is not always unimpeachable where the author's feelings are enlisted for or against persons or acts. That it was written with a sincere desire to present a truthful record of the deeds of the Army of the Potomac almost every page bears evidence; and, although it may not become the one history of that army, it will prove a storehouse of opinions and facts to which future explorers must often refer.

The Adventures of Reuben Davidger; seventeen years and four months captive among the Dyaks of Borneo. By James Greenwood. (Harper & Bros., New York.)—This book will be read by the young with the same kind of interest as that excited by "Robinson Crusoe." We should regret more that the author had chosen so barbarous and bloody a scene for his story, except that we believe it to be the common experience that what we read in childhood we sift by a sort of natural selection—skim through the grosser parts from an innate repugnance to dwell upon them, or else from inability to understand them—and, according as the residue is entertaining or otherwise, remember a book ever after as good, bad, or indifferent. In this way, we doubt not, "Reuben Davidger" will be appreciated for its lively action and varied incidents, spite of the repulsive, even if strictly truthful, accessories. The judgment of our maturer years, however, is in favor of the opening chapter above all the rest. It is an exceedingly skilful piece of composition—after very good models.

Hospital Life in the Army of the Potomac. By William Howell Read. (Boston: W. V. Spencer.)—This is a glimpse of war, as it looks in the train of ambulances, among the shiploads of wounded men, in the crowded hospitals; of war the day after the battle, in its cruellest aspect. In its noblest aspect also, in which it reveals the impressive fortitude, the cheerful, patient courage that no man could witness without learning to be proud of his countrymen and his kind. No wonder Shakespeare sent his Lord Biron into a hospital. There he could surely be cured of flippancy and cynicism, and made to feel that human nature is very respectable. The book will interest a large class of readers; too large a class, unfortunately, for there are not very many Americans able now to read of men dying in hospitals without reading between the lines. Its style, if that is not too ambitious a word to apply to its language, never draws the reader's attention from its facts, and these are valuable as lessons and as part of a picture of the great struggle.

MR. MILL IN THE HOUSE OF COMMONS.

LONDON, April 21, 1866.

IT would have been not at all surprising if the greatest living writer on logic and political economy, passing at the sixtieth year of his life from the solitude of his study into that stormy assemblage which has been described as possessing "all the vices of a mob with none of its virtues," had found himself unfitted for a distinguished participation in its discussions. The case, however, has turned out exactly the opposite. Mr. Mill has now spoken four or five times. Though at first there was some wavering in the verdict, each succeeding effort has been an ascent upon its predecessor, until, within the past few days, he has achieved a great and unmistakable triumph, and has made for himself a high place in the annals of parliamentary eloquence.

As it was my rare good fortune to be present in the House during that last marvellous speech, I propose to give a brief account of the scene, as well as a summary of his parliamentary career up to the present time.

On the opening of the session in February, Mr. Mill was among the earliest to arrive at the House; and, from that day to this, he has shown a punctuality in coming, a patience in listening, and a persistency in staying

even through the longest and dullest debates, which indicate that membership of Parliament is not to be with him, as it is with so many, a mere titular decoration, a genteel episode in professional toil or fashionable distraction. From my outlook in the gallery, it has seemed to me that the three most indefatigable legislators in the space below are Mr. Speaker, Mr. Gladstone, and Mr. Mill. All other members are peripatetic and flitting, chatting in the lobbies, lounging in the coffee-rooms, fleeing for their lives to the opera and the club from the dreary pattering of senatorial bores. These three are the ever-present figures in the House, whosoever proses, whosoever goes: the Speaker, couched upon his sumptuous and canopied throne, with his lame foot reposing on a pillow before him; Mr. Gladstone, often the only tenant of the Treasury bench, catching in the net of his all-comprehensive memory everything that falls in debate, and indemnifying himself, in the course of an eight or nine hours' discussion, by the luxury of inventing a greater variety of sprawling postures than one would suppose the human form even of an acrobat or a financier was capable of assuming; Mr. Mill, at the upper end of one of the Independent Liberal benches immediately behind the place of John Bright, conspicuous for the innovation of keeping his hat under the bench instead of upon his head, and for his noble, pure, intellectual face, always turned attentively towards the member who may be speaking, and reflecting, as in some exquisite and sensitive mirror, whatever worthy thought or emotion may be generated by the debate.

The first important subject which came before Parliament this year happened to involve one in which Mr. Mill is the great authority, that of economics; and he but yielded to the general expectation in making his maiden speech without that probation of silence to which parliamentary catechumens usually submit. The cattle-plague was to be stamped out. Veterinary science had broken down. The pole-axe alone remained, the last argument of butchers. Every beast guilty of infection was to be instantly killed. But the great agricultural interest, never very eloquent and never very bashful, demanded that the Government should compensate the owners for all cattle thus sacrificed. "Not so," was substantially the reply of Mr. Mill; "let the farmers as a class organize among themselves a fund for the compensation of individual losers belonging to their class; since the farmers as a class, by the increase in the price of beef in proportion to the diminution of supply, are, according to inevitable economic laws, to be fully compensated for the aggregate loss. But if Government shall pay for every beast killed, the farmers will be paid twice over, and the general body of the community will have to pay twice over, first by the extra taxation, and second by the extra price of beef." When Mr. Mill rose, there was a movement of respectful attention throughout the whole House. The great economist whose writings had been quoted there for years was at last present to speak for himself. His physical organization is of that fine and delicate sort which, with reference to the indwelling spirit, may be said to be almost transparent; and on this his first appearance his bearing was so diffident and so sincere, so tremulous yet so intensely earnest, with so much of the reality of a great intellectual authority, yet so free from the slightest assumption of it, that the genuine English courtesy of the House was conciliated into a deferential and really applausive silence. Almost the only fault in his speech was one easily remedied: his voice, probably from nervous agitation, was pitched in too feeble a key. The essential and the gratifying thing indicated by that first speech was his ability to think acutely and profoundly on his legs and in the midst of a multitude, and the power of clothing his thought tersely and fluently in the choicest words. Two nights after, Mr. Ayrton—member for George Thompson's old constituency, the Tower Hamlets—a glib lawyer who considers himself foreordained to speak on all possible subjects and who is never guilty of any excess of self-depreciation, indulged in a fling at Mr. Mill's positions. Instantly Mr. Mill rose in reply, and now with a voice distinctly audible in every part of the House pointed out the irrelevancy of Mr. Ayrton's arguments and reiterated his own with still greater force of illustration. As soon as Mr. Mill was seated, Mr. Lowe, whom John Bright the other day described as the "intellectual gladiator" of the House, advanced to the charge against the new member. Mr. Lowe was a foeman worthy of his steel; and again this scholarly recluse, with his intellectual eye as clear and penetrating in the crowded assemblage as it was wont to be in the voiceless company of his books, rose and met the onset of Mr. Lowe, covering the vital point of his own argument and thrusting his sword exactly through the middle of his antagonist's. When Mr. Mill took his seat every intelligent man felt that a new and an unsurpassed power had joined the House of Commons. His second and third speeches showed what the first could not, that the great dialectic abilities of Mr. Mill are capable of being brought to bear in Parliament in hand-to-hand contests, in running debate, in logical repartee.

Passing over Mr. Mill's great argument on the reform bill, which I did not hear—an argument the depth and massiveness of which are daily growing in the appreciation of the country—I come to the memorable speech I have already referred to, delivered last Tuesday evening.

The subject of discussion was again a bucolic one, the reduction of the duty on malt; and the resolution to that effect had been moved by Sir Fitzroy Kelly, the predestined Lord Chancellor of the next Tory ministry. The debate had dragged its slow length along over leagues of statistics and platitudes. Not a ray of genuine thought, not a flash of enlivening sentiment, had been emitted, when Mr. Mill rose to second an amendment, the point of which was that any redundancy of revenue should be applied not to a remission of the malt tax, but to a payment of the national debt. Not more than seventy members were left in the House. Mr. Bright, Mr. Disraeli, Lord Stanley, had long since fled. Mr. Gladstone was quite alone—

> "A pillar of state: deep on his front engraven
> Deliberation sat and public care;
> With Atlantean shoulders fit to bear
> The weight of mightiest monarchies."

On the Tory side, the only eminent man left to Sir Fitzroy was Bulwer Lytton, whose long, meager, uncouth form had writhed and twisted impatiently upon his seat, and who, upon the appearance of Mr. Mill, bent far forward with his chin in his left hand and the elbow resting on his knee, while his eyes glared intently from beneath the shade of his broad-brimmed hat. Two or three country members noisily stalked out of the room; some on the Liberal side moved still nearer to Mr. Mill, and all who remained sat in attitudes of respectful attention. I need not recapitulate the speech which he then made. His voice, though tremulous and by no means loud, was perfectly distinct, and every syllable from his lips was audible in every part of the House. His manner was the perfection of dignified, scholarly, and sincere speaking; almost pathetic in its earnest tones; not facile with the glibness of practised oratory, yet fluent with the deliberation of one who is master alike of deep thought and of fitting words. It is strange the magic there is in the slightest touch of genius upon an assemblage, however weary, however dull. The first real statesmanly thought born to us that night seemed to open the heavens above our heads, and to let in light and the atmosphere of life. All felt the witchery of the spell; and the climax of admiration and of excitement was reached when, at the close of his compact and unanswerable demonstration, he commenced that peroration which must become a classic in our language, and which old members of Parliament have pronounced the most poetical and eloquent passage heard there for many years:

"I beg very strongly indeed to press upon the House the duty of taking these things into serious consideration, in the name of that dutiful concern for posterity which has been very strong in every nation that ever did anything great, and which has never left the minds of any such nation until, as in the case of the Romans under the Empire, it was already falling into decrepitude and ceasing to be a nation. . . . Whatever has been done for mankind by the idea of posterity—whatever has been done for mankind by philanthropic concern for posterity—by a conscientious sense of duty for posterity—even by the less pure but still noble ambition of being remembered and honored by them—all this we owe to posterity, and all this it is our duty, to the best of our limited ability, to repay. All the great deeds of the founders of nations, and of those second founders of nations, the great reformers—all that has been done for us by the authors of those laws and institutions to which free countries are indebted for their freedom, and well-governed countries for their good government—all the heroic lives which have been led and the deaths which have been died in defence of liberty and law against despotism and tyranny, from Marathon and Salamis down to Leipeic and Waterloo—all those traditions of wisdom and of virtue which are enshrined in the history and literature of the past—all the schools and universities by which the culture of a former time has been brought down to us, and all that culture itself—all that we owe to the great masters of human thought, to the great masters of human emotion—all this is ours, because those who preceded us have taken thought for posterity."

Great as must be the delight of every one who only reads these immortal sentences and the remainder of the passage from which they are torn, that delight cannot compare with our rapt astonishment who actually heard them; with our startled and breathless joy as in the moment of their conception they came dropping so timidly, with so sweet and gentle a cadence, with such an unassuming beauty, with a passionate earnestness so veiled and chained by intellectual refinement, from the quivering lips of the speaker. There was in his manner nothing of the triumphant complacency of mere rhetoric, nothing of the muscularity and physical jubilance of mere oratory. It was altogether and infinitely above it. It was pure, ethereal, unearthly.

The immediate effect of that speech was indescribable; while upon the public, who have been reading it and discussing it ever since, its effect seems likely to be profound and lasting.

THE BOMBARDMENT OF VALPARAISO.

[FIRST NOTICE.]

It is a matter of doubt whether any exigency of war can justify the deliberate destruction of private property. Military and naval commanders usually apologize to the world even for necessary or accidental interference with the interests of private citizens or neutrals. Certainly, then, no excuse can be offered for destroying an opulent commercial city, incapable of materially influencing the operations of war, either by impeding or endangering the progress of an army or threatening any injury to a naval force. Valparaiso was bombarded by the Spanish squadron on the 31st of March. We have studied in vain to find in the manifestoes and official documents issued by Admiral Pinzon, his successor, Pareja, and Commodore Nunez, any good reason for this measure. The manifesto which Nunez sent to the diplomatic corps on the 27th of March is singularly unintelligible. We are assured that it has been correctly translated, and the facility with which Spanish is rendered into English makes it certain that either Commodore Nunez has no ideas to express or is wofully ignorant of the manner of expression, for, had the original been clear, the translation would, at least, have been comprehensible.

But in his verbiage two very queer confessions are made. First, the failure of the attempt to destroy the allied fleet in their place of refuge at Chiloe; second, the fear of some injury to his own squadron as the reason for avoiding another effort to dislodge that fleet. These admissions are strangely out of place in a communication issued for the purpose of announcing an intention to burn the property and endanger the lives of the citizens of a hostile power. Considering the nature of this acknowledgment, in conjunction with the refusal of the Spaniard to accept the challenge of President Perez to engage the allied squadron in the open sea, it is fair to conclude that he is afraid to meet the armed forces of the Republic, and will, hereafter, devote his energies to ruining non-combatants and battering with shot and shell the residences of peaceable citizens. Admiral Pareja was more logical than this man, yet he was insane enough to commit self-destruction.

To weaken an opponent is a legitimate object in war. There are two ways by which this can be accomplished, either by exhausting his capacities for offensive operations or removing his means of self-defense. The acts which may be sanctioned in these attempts occasionally vary, according to the cause of the war and the purpose for which it is waged. The Spaniard claims that the Government of Spain has been insulted by that of Chili, and demands satisfaction. By his own concession it is a point of honor which is in question. Therefore he should direct his efforts only against the party itself, or its authorized representative, from whom he demands reparation. He violates every rule of that honor of which he boasts by avoiding a conflict with the national defensive force of Chili, and inflicting wanton destruction upon the people and friends of that republic. He, furthermore, displays cowardice by choosing a point of attack where he is perfectly secure from harm and capable of injuring only those who, he knows well, are unable either to attack him or defend themselves.

Valparaiso is a commercial town. It is so favorably situated for communicating with interior provinces that, even with a bad harbor and very deep anchorage, its commerce is larger than that of any other port on the West coast. Its interests are solely, purely mercantile. It has no government docks or yards wherein vessels, ordnance, or ammunition might be prepared for service. Within its limits are no armories for the manufacture of the utensils of war. There are no accommodations for large bodies of troops, organizing for offensive operations. Its capital is largely owned by foreign merchants, and is a source of revenue to their respective nations. In no particular would Spain weaken the capacity of Chili for offensive operations by the entire destruction of Valparaiso. The allied fleet is the only force with which the Republic can assume the aggressive. Can Valparaiso add to the defensive power of Chili? Three forts occupy positions commanding the harbor, but they are, and have been, unarmed. They are not garrisoned, with the exception of a few companies of soldiers stationed in them to preserve the domestic quiet of the city and neighboring territory. Neither is the city the entrance to an inland country, rich in supplies of provisions and abounding in wealthy villages. On the contrary, for fifty miles towards the interior, there is scarcely sustenance for more than the cactus and lizard. The Spaniard would, then, find it no obstacle, if he wished either to gain supplies for his squadron or deprive his enemy of a source of provisions.

But he has manifested no intention of landing an army or getting a foothold at Valparaiso. Is it his purpose to dampen the ardor of his antagonist? He pursues the very policy most likely to inflame the popular mind to resistance. Does he wish to check the commerce of the country? From the ashes which he has created the mercantile interests will arise with renewed vigor and increased activity. Such a demand will be made for foreign capital, merchandise, and labor, that, from all countries, a tide of commerce will flow thither unprecedented. While legitimate objects of attack, upon which he can expend his ammunition, exist, there is no justification for bombarding the undefended seaport towns.

We believe that, in spite of the badness of the reasoning process by which Commodore Rogers sought to justify his proposed interference, his desire to interfere, which of course does the highest credit to him, has won both for him and General Kilpatrick the sincere regard of the inhabitants, while the British admiral is just now loaded with the execrations of his own countrymen in Valparaiso. He seems to have been at one time as sure of his right to interfere as Commodore Rogers, but to have had less pluck, and would consequently not commit himself.

We hope that this great outrage will have the good effect of awakening the sympathies of all nations for these republics, and rouse the Governments of the United States and England to a determined remonstrance against the policy of Spain. All we ask is that, if humanity, or justice, or policy, call for our interference, that our course be deliberately shaped in Washington by the President and his Cabinet, instead of being traced out for us by naval and military officers on the spot. The acts of a great power are precedents, and precedents should only be created by statesmen and lawyers.

HEALTH IN GREAT CITIES.

A PAMPHLET on the alleged deterioration of race, brought about by the growth of large cities, has lately appeared in England from the pen of a Dr. Morgan; and, whatever may be thought of his inferences, his facts are interesting and instructive. It appears that in England, at least, while the proportion of marriages to population is in the towns the triple of what it is in the country, country marriages are two and a half times more prolific. Then, again, the death-rate in cities is one-third larger than in the country districts, so that, what with scanty births and numerous deaths, every town in England would speedily be depopulated if a constant stream of population did not flow into it from the country. What makes this fact all the more startling is, that rather more than half the population of England and Wales now live in the great towns, so that to keep them filled up is a drain on the country districts which is felt every year more severely. Dr. Morgan finds in all this proof that the inhabitants of cities are deteriorating physically, and in doing so, of course, lower the type of coming generations. But the fact seems to be that whatever defects may be created by city life, they are not transmitted to such an extent as to exercise a serious influence on posterity—the reason being that feeble city children generally die off, and those who reach maturity are therefore apt to be picked men and women. It is well known that city-bred men are in all countries found to undergo that severest of all tests of physical vigor, military service, even better than country people—a superiority which is by some observers ascribed to the gain in nervous force wrought by city life; and we doubt very much whether the average country maiden could stand the wear and tear of "a season" in any of the great capitals of the world with nearly as much success as those bred in town drawing-rooms. The capacity of a country girl to undergo severe muscular labor, such as walking, riding, or

rowing, milking or sweeping, is not necessarily an indication of greater vitality. These occupations are in themselves health-giving, even when followed by fatigue. Vitality, which is, after all, the very basis of health, is best tested by pursuits in themselves unhealthy and which involve a drain on the nervous power, such as loss of sleep, exposure to excitement, or anxiety, or mental worry.

We are sorry we have no means at hand of ascertaining the comparative growth of city and country population in this country. There is no question, of course, that the latter greatly outstrips the former as yet; but it is equally certain our cities are growing with a rapidity which, in view of the feebleness of our efforts to govern them, and the general ignorance of, or indifference to, the means of keeping them clean and healthy, may be called positively alarming. In other countries there are one or two growing rapidly; we have a dozen or two which promise in a dozen years or so to surpass in size and populousness all others of ancient or modern times. Their growth is stimulated in a variety of ways. One is the easiness of access; another is the prodigious increase of commerce and manufactures, the latter having of late years been forced heavily by the high tariff. We consequently can show several "centres of population" which, being largely created by drift from all quarters of the globe, are not much above those of Europe in intelligence, education, self-respect, or habits of self-control. We are trying to govern them too by the machinery which was invented and used by the old American population of fifty years ago, those quiet, thrifty, reading farmers, who laid the foundations of American society, who were for two centuries its boast and glory, and are still its salvation, but who are in some parts of the country being rapidly supplanted by swarms of foreign operatives. The legal influences we are able to exert, therefore, on behalf of health and cleanliness are far below those with which European legislators are armed.

That the effect of life in these busy hives upon health and physique will be much what it is in Europe, there can be little question. The same causes are at work in both places; and it seems to be settled that foremost amongst these is bad air—one of the inevitable results of crowding. That the day will come when crowding a great number of men and women together on a small space of ground will not make the air very bad after all, we think very likely; but that day is clearly a long way off. The art of policing great cities in free countries is still in its infancy. Despots alone do it successfully; but our people will hardly ever be disposed to purchase cleanliness by the surrender of their freedom. Such powers as the Board of Health in this city is armed with would hardly be tolerated as a permanency.

In the meantime, there is nothing so much needed as the use of all the influences at our command to diminish the flow of the country population into the towns; or, if this be too difficult, as we fear it is, to induce those whose business lies in them to live out of them. The plain fact of the matter is, that country life is to most Americans at this moment intolerable, and no wonder. In the first place, the means of reaching the country are disgraceful not simply to the railroad companies but to our civilization. We cannot recall to mind at this moment a single line of railroad which the directors seek to make agreeable or convenient to those who have to use it every day. Most people who live in the neighborhood of a great city make their purchases in it, particularly ladies. This is not a luxury; it is a necessity. A place at the station, therefore, to which parcels might be sent to await the arrival of the owner, would be a great convenience to suburban residents. On most suburban lines, however, no parcel will be received unless the passenger is there to receive it. This is a small matter, but it indicates a good deal. We have so often discussed the condition of the cars that we shall not here return to it. The trains are generally arranged to start or not to start at ingeniously inconvenient hours. The theory on which the time-tables of most suburban lines is apparently drawn up is, that nobody living in the country ever wants to spend an evening in the city, and nobody living in the city wants to spend one in the country; and yet there is perhaps nothing that makes country life so distasteful to all classes, working-men included, as the fact that it cuts them off from those sources of amusement or entertainment, social or other, such as only cities can supply. It must be admitted, in fact, that the social attractions offered by the country are well-nigh worthless. People who live in the country, and who have the good sense to try and make the best of it, generally try to persuade themselves and others that they have all the society they want; but in their secret hearts they know they heroically and innocently lie. Under the most favorable circumstances, they rarely see much of their neighbors. The distances are too great, and when they are not, the roads are, during three-fourths of the year, either too muddy or too dusty to make walking agreeable. Harnessing vehicles for the payment of nocturnal visits is not agreeable, if one has to do it one's self; and it is still less agreeable to have to ask a coachman to do it, as coachmen go in these days; so that the great majority stay at home, hoping that people will "drop in in the evening"—a pleasing anticipation in which the mass of men and women who are fond of society continue to indulge in the earlier part of their lives, but which they get over before they reach what novelists call "the grand climacteric." People rarely do "drop in in the evening" anywhere. One meets with circles now and then in which the custom prevails, but they are mostly family circles, or circles long established and bound together by old and valued associations. Amongst the heterogeneous populations of most country "neighborhoods" families stay at home and wait for others, and the general prevalence of this practice of course involves general disappointment.

Then, again, persons brought together by accident in the country are not often congenial. There is no good reason why they should be. Tastes, pursuits, and antecedents may and do differ, and when they do differ conversation is apt to be a bore. And it must be confessed that, except in the case of persons of great powers, great cultivation, or great originality, meeting the same persons very often soon ceases to be amusing or entertaining. Each one very soon gets acquainted with all his neighbor's jokes, his best stories, his favorite personal experiences, and soon learns enough even of the character of his mind to be able to predict with tolerable certainty what he will say on any ordinary subject that comes up. The result is that one very rarely finds country circles rely very long on conversation. They fall back on games or "Shakespearian readings," which are generally very well for a while; but people tire of games, and there is a limit to one's enjoyment of hearing Shakespeare badly read.

The true remedy for all this is to make removal to the country as little of a separation from the city as possible, to enable people to enjoy the pure air and good scenery of the one without losing altogether the pleasures of the other, and this can only be done by thorough railroad reform. There is, in fact, it may be safely said, nothing on which the health of the cities of the United States will hereafter so much depend as this.

THE BLACKS OF HAYTI, AS SEEN BY AN ENGLISH TRAVELLER.

Mr. Henry Yates Thompson, whose name is known in this country as that of the author of the proposition to establish an American lectureship at the University of Cambridge, in England, has recently visited Jamaica and Hayti, on his way to this country for a second time. In a letter to the London *Daily News* he has given the results of his observations on the negroes in Hayti. They are valuable as the opinions of a man of candor, intelligence, and good sense, who has gained a standard of comparison and judgment by considerable travel in various countries.

The general ignorance, even among intelligent and cultivated men, in regard to the actual condition of Hayti, and the importance of trustworthy information concerning "this novel democracy of black and mulatto freedmen, part French and part negro in origin and language, which is to-day but in the sixty-third year of a most chequered existence, and which has barely even yet contrived to get complete recognition in the fastidious society of nations," induces us to lay before our readers the more striking parts of Mr. Thompson's letter:

"No thoughtful man," he says, "regards this country in any spirit of flippancy or jest. It is to be looked on rather as the test experiment of the manhood and capacity of the African freedmen, as containing the knot of a question which is as broad as humanity itself, and which, after a century's discussion by tongue, and pen, and sword, throughout Europe and America, has lately shaken, and still shakes to its deep foundations, one of the strongest governments in the world. . . . . For I defy any man to see even a little of the leading Haytians without being driven to the opinion that the capacity of freedmen of African or semi-African descent for social and intellectual elevation can only be measured by their opportunities. I have made the acquaintance in this insignificant town [Jacmel] of a merchant who, as far as color goes, is entirely, or almost entirely, of African origin, who in

manners and conversation might ornament any drawing-room in Liverpool or London. This man talks French and English not sensibly and grammatically only, but with the accent and ease of a perfect gentleman. He has travelled, and observed, and read much during a life at least as long as that of his country; and, prepared as I was, and as I suppose all Englishmen are, to acknowledge the capacity of the African races for improvement, I own that it has been a surprise to me to find not from this instance only, but from many instances both here and at Port-au-Prince, that they have already advanced so far. Both among the merchants of the towns, and the peasant freeholders who form the great majority of the country districts, and are evidently the backbone of the nation, there is remarked in the Haytians, in comparison with the other creoles of the West Indies, a graver and more dignified personal bearing, more refined features, and more agreeable manners. And is not this what we naturally expect to find? The Haytians have been longer free than the others. They have been free nearly twice as long as the Jamaica negroes, for example, and, what is still more important, they freed themselves. Since emancipation they have not been overshadowed by the presence of a caste of whites their superiors in civilization and their former owners and masters."

Further on, in the same connection, Mr. Thompson speaks of "the undoubted and immense superiority of the Haytians to the Jamaicans," and of a conversation in which this superiority was asserted. An English missionary present, who had been making an extended visit to the island, and who, since his own district among the mountains of Jamaica contained over 20,000 negroes, had a good opportunity for comparing the two populations, apparently could only observe on the other side that, under the laws of Jamaica, there was absolutely no distinction of color. An old Haytian, in reply, suggested that if Gordon had been a white man, his trial and execution would probably have been a little less summary; and that in fact, however equal the laws may be, the freedmen of Jamaica are brought in disastrous competition with the class from whom they are distinguished by their color, and who in one way or another represent their former masters, so that they can never have entirely fair play to rise. That the same thing had not happened in Hayti was due to that article of the constitution which reads: "No white man, whatever may be his nationality, is permitted to land on the Haytian territory with the title of master or proprietor, nor is he able to acquire there either real estate or the rights of a Haytian." It is this well-known prohibition, let us remark, in passing, which enabled ex-Gov. Perry, in his recent correspondence with Mr. Greeley, to contrast Hayti as a black man's government with the United States as a white man's. The fallacy hardly needs to be pointed out. Hayti does not deny the equal brotherhood of man, but her bitter experience of the white race, and her well-founded apprehension of the designs of a neighboring slaveholding republic, warned her to protect herself against possible invasion and re-enslavement, and to exchange the tri-color for the bi-color. "The prejudice," says Mr. Thompson, "pervades the whole people, and crops up in many forms. There is a favorite Haytian proverb often quoted in this connection. It tells us, in the dog-French of the common people, that *œufs pas mele n'en calinda roches*—eggs must not mingle in the dance with stones." But, according to President Geffrard, this prejudice is on the wane. The obnoxious clause is practically evaded in many ways, and is likely to become obsolete before it is abrogated. Their isolation has not rendered the Haytians arrogant or offensively boastful of their own country. "All with whom I conversed," says our witness, "took a diffident and modest tone;" and for what concerns the actual treatment of the whites, spite of their political disabilities, he quotes appreciatively from Mr. Redpath's "Guide to Hayti" that "in social life, and in the callings for which they are legally qualified, they are treated with all the courtesy and regard to which their character entitles them. Exemplary conduct on their part always enables them to overcome the social disadvantages attaching to their unfortunate color."

THE LEGISLATIVE SATURDAY.

THERE was an ancient custom in New England, introduced from England or Scotland, of devoting a portion of the schoolboy's Saturdays to committing and repeating the "Shorter Catechism." Why it should ever have been called "shorter" is a mystery to us. Growing out of this custom, no doubt, the lower House of Congress is in the habit of devoting its Saturdays to a similar performance. It is not exactly catechetical, though to some extent a rehearsal of obscure doctrines, badly committed to memory. As it is growing into a settled innovation, let us briefly describe this curious legislative performance.

A citizen of this republic, sojourning at Washington, saunters up the Avenue on a Saturday. He has been fixing his eye on the white dome of the Capitol, with the black speck on the top of it, until he reaches the gate and is informed, on enquiry, that it is Saturday, and the Senate is not in session. The "Senate" may have gone on the Potomac to Mount Vernon, or in the cars to New York or elsewhere; or fragments of it, not exiled from the White House at the other end of the Avenue, may have gone thither with friends from their own State, and be waiting, patiently or otherwise, in the presidential ante-rooms.

But our novice is at the gates of the Capitol, and he has found out that the House is in session, as is indicated by the flag still floating at its end of the building. He gropes his way through hall and corridor, escapes the griffins that lie in wait with oranges and photographs, and contrives to stumble into the gallery of the House. The hall is rather sombre, daylight struggling in drearily from the top; but even the light of a dull day makes the gilding glare painfully. He observes the two little flags over the Speaker's head, and has taken his seat before perceiving that a man is on his legs, behind one of those little gingerbread desks, haranguing the House. He cannot hear a word he says, partly because the man does not talk loud enough, but chiefly because no one is paying any attention to him. But few members are in their seats, and these are busy writing, an exercise that they vary with another that somewhat amazes our friend. He tries vainly, and would like to catch a word or two of a speech that seems to elicit such terrible applause. The members are constantly clapping their hands with great but not prolonged energy, at which little hobgoblin pages spring about, running as if to relieve each surcharged member of his enthusiasm; and our friend gradually discovers that the hand-clapping is not applause, but a mode of summoning the pages.

He gazes in bewilderment on the Babel before him. The *man* is reading his speech, and does so from a printed copy, and as if he were paid by the line for it. The pages skip about. The members clap their hands. People come in and look at the show with stoical apathy, and then go out again. The man finishes his reading and sits down. Another man gets up and commences the same performance. The members go out, until not over a dozen of them are left. The man is reading his speech. He does not do it very glibly; he does not do it as if he expects to gain anything by it. Some humane friend comes to his rescue with a motion; by parliamentary fiction the speech is considered delivered, and printed with the proceedings, and as many copies as the orator likes to pay for may be stuffed into the glory of a buff envelope and franked to a wondering constituency in his "district."

It may be a necessity in the economy of the great parliamentary whale that it come up to the surface and blow off, and then go down again. If it could be entirely restricted to the Saturdays it would be better; one day in six is, after all, not a great deal to devote to parliamentary nonsense. Making a speech is considered the destiny of our politicians. The member who should not succeed in going through the operation just described at least once in each session, and franking home many thousand dirty-looking little pamphlets as evidence, would be considered an utter failure—a fraud upon the public. It makes no difference that he has nothing to say. It makes still less that no one wants to listen to him. At the close of his "catechism" some leader of the House may be kind enough to shake him by the hand and congratulate him on his "speech," but even the most verdant member is not unsophisticated enough to believe that it had any effect on anybody. It is a very broad farce and a very shallow one. Each Saturday gets rid of half a dozen of these orators.

There are few occasions that justify a great parliamentary speech, as, by a wise dispensation of Providence, there are few politicians able to make one. Parliamentary power does not lie in great speeches, but in an intellect clear to grasp in a moment the strong points of a case, and in a ready command of the few pungent words that will fix them in the minds of listeners. Some parliamentary leaders have as much power to-day as they had yesterday, and will have for ever. These are the true kings, and their sceptres are not polished on Saturdays. They do not make speeches and recite them to empty benches. They may, indeed, have a weakness occasionally to rush into print; fortunately they have something more.

Fine Arts.

THE FORTY-FIRST EXHIBITION OF THE NATIONAL ACADEMY OF DESIGN.

[FIRST NOTICE.]

THE Hanging Committee have done their work well, this year; so far, at least, as the outside world can judge of it. This is but imperfectly. One important part of their work the world knows nothing of. What's hung it partly may compute, but knows not what's rejected. That primary part of the committee's business, rejection, the world can only judge of by contrasting this exhibition with previous exhibitions. Thus it is plain that while this year's collection s the worse for the absence from it of the works of

this painter, it is better for the absence of the works of *that;* at the same time it cannot be supposed that the pictures whose absence is so welcome were not sent; they must have been sent, and rejected; and the smallness of the exhibition helps that conviction. A walk about the galleries and the mental comparison of the five hundred and twelve pictures in them with the six hundred and sixteen of last spring, although not showing any decided superiority of one exhibition over the other, yet lead to the belief that the veto power has been used and used wisely.

But whether this credit is rightly or wrongly given to the committee, the arrangement of the pictures admitted seems mainly just and wise. There are few instances of good work hung out of sight—few of bad work hung on the line.

The favorite place, the middle of the south wall of the South Gallery, is occupied by Mr. Huntington's portrait of Abraham Lincoln. This is, indeed, not the best picture in the exhibition, nor even one of the best; but we cannot find fault with the placing there of a portrait, not without merit and painted by the president of the Academy for the Union League Club, of our foremost man who is gone. Other portraits crowd into this large gallery. Mr. Elliott's portrait, No. 393, of a school-boy, is very pleasant, full of character, and contains, what is rare, a well-drawn hand. This is probably the best portrait in the exhibition, unless the two oil pictures by Mr. William M. Hunt, of Boston and Newport, are better. These are both in this South Gallery. No. 342 is a very vigorous portrait, life-size and about three-quarter length, of a lady holding a child, a picture showing considerable power of drawing and great skill in laying color. No. 405 is smaller, half length and also life-size, a lady's head shown against a background of light grey and gold, wall-paper, namely, and framed with singular appropriateness. We know of no work of Mr. Hunt's so good as his portraits, and these are among the best of his portraits. The two charcoal portraits, Nos. 34 and 64, ought not to be exhibited. Useful studies they may be, but only as private memoranda of the artists, and the disposition on the part of some people to admire such things is very harmful.

In the best place of the North Gallery is appropriately hung an important picture by Mr. J. F. Weir. It is only to be regretted that there cannot be one of the benches placed before it; a heater in the middle of the room prevents that. The picture requires a long look, and will reward it better than most pictures; the spectator ought to be allowed to sit before it a while, comfortable and undisturbed. This picture is No. 171, is called "The Gun Foundry," and belongs to Mr. R. P. Parrott; so that there is no doubt as to the scene represented. The canvas is large, and the scene takes in nearly the whole interior of a founding shed at the West Point or Cold Spring foundry, the well-known "W. P. F." A gun to bear that imprint is being cast; the great pot full of molten metal is swung to the right place by a huge crane, with four men at the windlass and one at the guide-chain; half-a-dozen more attend and tip the pot or bucket from which the carbonate of iron is running into the mould, thick, like molasses, hot and bright. The dusky shed, usually lighted only by the dim twilight that creeps through dirty windows high overhead, is filled now with the glare of the metal. Another mould is being prepared; the pipes or hose to carry cold water, Rodman fashion, to the centre of the casting, are adjusted, and a man is working at the channel through which the metal is to run—a different operation this is to be. It is well that this industrial epic has at last been painted. It is a wonder that no New York painter has represented the gloom and glow of similar scenes at the great iron-works here; it is well that a West Point painter has done this. He has done it well. There is a very unusual coherence and distinct meaning to his picture. The work is really getting done; the men are really busy, and sensibly busy; the chains hang in real catenary curves and the windlass rope is strained tight; the tools are explicable and useful-looking; a freshly cast gun on the ground is something like a freshly cast gun; the "flasks" which contain the gun-moulds are of a comprehensible shape and construction; the picture is real, and that is less often true of American pictures than could be wished. It is curious how much better drawn and conceived are the workmen in attitudes of violent action than the visitors—two ladies, three gentlemen, and a dog, who are lifeless enough. As regards the workmen, there is this cause only for regret, that they are a little too much like some models we have all seen in third-rate German pictures. It is not probable that Mr. Parrott's workmen look so like the hirsute monsters in Moritz Retszch's illustrations, especially those to Schiller's "Gang noch dem Eisenhammer." Those, childish as the fiends in the pictures to Faust, are feeble attempts of an unimaginative spirit to conceive rugged strength. We do not compare Mr. Weir's good picture with Retszch's worthless outlines, but we have the same sort of objection to the workmen in both—they all seem to be exaggerated studies of a single type, and that an unusual one in our workshops. The color of the picture is not wholly right. On the other hand there is great skill in the management of the two conflicting lights, and it may well be that better and livelier color would have been a not unmixed advantage.

There are two pictures by Mr. Eastman Johnson: No. 247, "Sunday Morning," and No. 251, "Fiddling his Way." They are both studies of New England interiors and New England people. They are full of expression. The former seems to us the better; and, although there are more beautiful pictures than this among those Mr. Johnson has painted, there are none which show more plainly his rare power. There are errors in drawing, now and then—not that the painter need make them, for he can draw if he tries—but it is curious to see how a really imperfectly-drawn figure can be filled full of feeling, if only the draughtsman can feel and is unaffected. How admirable is the young man, tilted back in his chair right under the high window-sill, the little girl near him, the old man who is reading the Bible aloud, and the children who are whispering. And, going to the other picture, we find their equals in the melancholy and expressive face of the negro, the delightful little boy, with hands behind him, who is as close to the music as he can get, and in the young woman, that typical young New England woman, worthy to have an Eastman Johnson paint her. The catalogue mentions another picture by Mr. Johnson, of which we may speak hereafter.

Mr. Winslow Homer has two pictures, and the military one, No. 490, "Prisoners from the Front," seems to be as popular as it deserves to be. We think Mr. Homer one of our first draughtsmen, in some respects unequalled, but this picture is not wholly in his best manner in execution. In the greater matters of meaning and expression it is hardly to be bettered. Those are real men—the officer with the star on his shoulder, the two soldiers with shouldered muskets, and the three prisoners. The Southern officer and the Northern officer are well contrasted, representing very accurately the widely differing classes to which they belong. Mr. Homer's other picture, "The Bush Harrow," is, to our thinking, even more valuable. The old farm-horse and the boy on the harrow are the heroes of this picture, and are perfect in their way, as good as the soldiers, and the picture is very beautiful, very interesting, fascinating in its strange deep color and bright sky.

Mr. C. C. Coleman's picture, No. 79, "Battery Reno, Morris Island, S. C.," has disappointed sincere admirers of his. It is not powerful or beautiful, nor in any respect excellent, except that we can be sure of the accuracy of the details. This assurance is valuable, and makes the picture interesting, although it is not artistically of great value. It is not necessary to compare Mr. Coleman with any one but himself, for his own better work of former years is the best standard by which to judge this.

BOOKS OF THE DAY.

AN IMPORTANT AND TIMELY WORK.

THE SOUTH SINCE THE WAR;

AS SHOWN BY

FOURTEEN WEEKS OF TRAVEL AND OBSERVATION IN GEORGIA AND THE CAROLINAS.

BY SIDNEY ANDREWS.

1 vol. 16mo. $2 00.

The intelligence and care with which the writer made his observations, and the marked candor with which he states them, have been recognized by the critics. As a fair picture of the condition and sentiments of the people of the South, this book is a valuable contribution to the discussion of questions involved in "Reconstruction."

"The writer had very favorable facilities for learning the true state of feeling among the people [of Georgia and the Carolinas], and has presented the information he gained in a very interesting manner."—*Boston Journal.*

"There is no false bias observable in the writer's statements or descriptions. . . . The soldiers and their families will want this book."—*Providence Press.*

"Mr. Andrews has just the qualities for a traveller. Among the many books of its class, his work will attain a prominent place."—*Cincinnati Gazette.*

"Timely and full of interest."—*Chicago Journal.*

"He jotted down the political proclivities of the people as he heard them expressed, and leaves his readers to draw their inferences."—*Philadelphia Inquirer.*

"An honest report from the South."—*Springfield Republican.*

"The book will be greatly sought after by every one who wishes to obtain a truthful representation of Southern society."—*Hartford Post.*

THE NEW FORTNIGHTLY MAGAZINE.

NOW READY AND FOR SALE BY ALL NEWSDEALERS,

THE SECOND NUMBER

OF

THE GALAXY,

AN ILLUSTRATED MAGAZINE

OF

ENTERTAINING READING,

PUBLISHED FORTNIGHTLY.

PRICE 25 CENTS.

THE GALAXY ENLARGED.

The gratifying reception accorded to the first number of THE GALAXY has encouraged the publishers to increase its size by the addition of sixteen pages. This enlargement will enable them to give greater variety and interest to its contents, by affording room for the numerous attractive contributions that have come to them.

THE GALAXY will now give to its readers 192 PAGES OF READING MATTER EACH MONTH, which is 48 pages more than is given by any other magazine published in this country.

THE GALAXY is published fortnightly, on the 1st and 15th of each month, and has the advantage of coming to the reader intermediately between the monthlies and the weeklies.

ITS TYPOGRAPHY.

The publishers have endeavored to make the typographical appearance of THE GALAXY as perfect as great care and large expense could secure, and they are pleased to be able to say that this feature of the magazine has received the highest praise from the press throughout the country. They think they may declare, without dispute, that in respect to the expense and quality of the materials used in its manufacture, it surpasses every other magazine in the country.

ITS CONTRIBUTORS.

THE GALAXY will be an original American magazine; arrangements have accordingly been made for regular contributions from the best known and most meritorious writers in the country; and, moreover, the Editor will always seek to elicit and encourage contributions from new authors of real ability or decided genius. The articles in THE GALAXY will be signed with the names of their authors, who will be allowed a wide freedom in the expression of opinions.

The First and Second Numbers of THE GALAXY, for May 1 and May 15, 1866, contain contributions from the following well-known authors:

FRANCES POWER COBBE,
RICHARD GRANT WHITE,
JOHN ESTEN COOKE,
ROSE TERRY,
EDMUND C. STEDMAN,
GEORGE ALFRED TOWNSEND,
PROF. PIERRE BLOT,
The AUTHOR of "EMILY CHESTER,"
DR. W. H. DRAPER,
GEN. CLUSERET,
J. K. MEDBURY,
S. S. CONANT, and others.

These are but the advance guard of the company of writers whose assistance has been obtained to make THE GALAXY without a superior in our periodical literature.

CONTENTS OF THE GALAXY,

FOR THE FORTNIGHT ENDING MAY 15.

I.—THE CLAVERINGS. By ANTHONY TROLLOPE. (With two illustrations).
CHAPTER IV.—Florence Burton.
CHAPTER V.—Lady Ongar's Return.
CHAPTER VI.—The Rev. Samuel Saul.
II.—IN THE HAMMOCK. By ROSE TERRY.
III.—THE MARCH OF THE CHOLERA. By W. H. DRAPER, M.D.
IV.—THE ART OF DINING (the first of a series on Cookery). By PROF. PIERRE BLOT.
V.—ARCHIE LOVELL. By MRS. EDWARDS.
CHAPTER IV.—Archie.
CHAPTER V.—A Cigar by Moonlight.
VI.—UNBELIEF. By the author of "EMILY CHESTER."
VII.—THE HOME OF VICTOR HUGO (with the portrait and house of the poet). By GENERAL CLUSERET.
VIII.—MISS CLARE. By MARIA L. POOL.
IX.—FALLACIES OF MEMORY. By FRANCES POWER COBBE.
X.—SPOKEN AT SEA. By EDMUND C. STEDMAN.
XI.—A STORY OF THE OPEQUAN. By JOHN ESTEN COOKE.
XII.—NEBULÆ:
Shakespeare's Birthday at the Century Club.
The Machinery of Dramatic Criticism.
Mr. Stedman's "Anonyma."
A London Strike.
The Society for the Prevention of Cruelty to Animals.
An Uncivil Missionary.

THE GALAXY is publishing serials simultaneously with their appearance in England:

THE CLAVERINGS,

BY ANTHONY TROLLOPE,

AND

ARCHIE LOVELL,

BY MRS. EDWARDS.

The first number of THE GALAXY, containing the first instalments of these stories, may be ordered from any newsdealer, or from the publishers.

Professor Blot on Cookery.

In the second number of THE GALAXY was commenced a series of articles on Cookery, by Professor Blot, the well-known teacher of the art. These articles will be made of great practical value to every family. Besides many general gastronomical directions of essential importance, they will contain recipes and practical suggestions which must secure for them thousands of readers.

The Illustrations of The Galaxy.

Each number of THE GALAXY will contain at least one full-page illustration, on tinted paper, which will be printed at the best press in the United States. Besides this, other illustrations, by clever artists, will be inserted in the text. It will be the effort of the publishers to make this feature of THE GALAXY worthy of the approbation of all tasteful and critical people. The opening illustration, by Mr. DARLEY, has been pronounced to be one of the finest pieces of engraving and printing ever done in this country.

TERMS:

The price of THE GALAXY is 25 cents a number; $5 for the year, of 24 numbers; $3 for the half year of 12 numbers. The yearly subscriber receives over 2,300 pages of matter (over 600 pages more than is given by any other magazine in the country), illustrated by at least 25 full-page engravings, on tinted paper, and innumerable smaller illustrations inserted in the text. Specimen copies sent to any address on receipt of 25 cents. Address

PHYSIQUE OF THE DIFFERENT STATES, also showing the Physical Degeneration of the Women of America.

CATTLE PLAGUE. Is it a question of Diet, or what is it?

$1 50 A YEAR; 15 CENTS A NUMBER.

The first five numbers of the present year, comprising an invaluable amount of important and interesting reading matter, will be sent to any address, as specimens, upon the receipt of fifty cents. Address

MILLER, WOOD & CO.,

15 Laight Street, New York.

FINANCIAL REVIEW.

NATION OFFICE, Thursday Evening,
May 10, 1866.

A GENERAL revival is taking place in business, especially in produce. An active demand has sprung up for breadstuffs, pork, lard, etc., and prices are uniformly advancing. Flour is $1 a barrel higher than it was a week ago; wheat, 20 cents higher; pork has risen nearly $6 in the past month. The advance is mainly due to purchases for Western account. Western farmers and dealers find that the South will take all the stock they have on hand, and are buying here instead of shipping produce eastward. General merchandise is also improving. There is a good demand for coffees, hides, sugars, etc., and prices tend upward. The country is generally bare of goods, and now that people are realizing that Mr. McCulloch's threatened contraction is indefinitely postponed, they are beginning to replace their stocks.

Gold has risen as high as 129¼. This afternoon it was 129⅛. Gold is no longer scarce. The short interest has been generally closed, on the belief that, if there is to be no contraction, the premium on gold is not excessive. Exchange has risen to 109½ to 109¾, at which rates specie can be shipped as a remittance. Between $1,500,000 and $2,000,000 of coin will probably be shipped on Saturday. The bill market has been swept of the commercial bills which were so abundant a few days since, and good commercial names sell within a fraction of bankers' signatures. At present prices, cotton cannot be shipped except at a loss, and unless the price falls here, or advances materially at Liverpool, the export must be light until the new crops come in. Opinions continue to vary widely with regard to the probable yield of the crop of 1866. Some authorities anticipate a crop of 2,000,000 bales; others, not more than 750,000. We incline to the belief that the former estimate is nearest to the truth.

Money continues very easy. Call loans are 4 to 5 per cent. Mercantile paper is 6½ to 7 for the best names, but the feeling is gaining ground that good names will presently be current at lower rates. No further progress has yet been made with the finance bill. It is understood that the Senate Committee on Finance will report it without amendment. The Secretary has advertised that he will pay off $20,000,000 of debt certificates, at 100 and interest, if presented within the month. He is not likely to get many certificates, as they command a premium in the open market, and the money which they represent cannot be used at a better rate than 5 per cent. Mr. Washburn has moved for a committee to investigate the causes of the failure of the Merchants' Bank, at Washington, by which the Government loses $700,000. Many sound men fear that other national banks have been speculating wildly with the funds of Government, and that, unless the deposits are removed, further losses will ensue.

The stock market is extremely dull, but firm. New York Central is depressed by reports of a heavy falling off in earnings. April is reported to show a decline of over $100,000 as compared with last year; but, in reality, the falling off will probably prove much heavier. The Western roads, on the peninsula between the lakes, show a gain, as usual on the opening of navigation. The North and South lines are doing very well, in consequence of the revival of trade with the South. An active speculation has been started in Western Union Telegraph stock, which has sold as high as 64. Mariposa preferred and Quicksilver are also higher, on purchases by cliques. Fort Wayne has been as high as 100½, but at about par the supply seems in excess of the demand. Pittsburgh is higher, on purchases by the old clique. The Prairie du Chien party have bought a round lot of Milwaukee and St. Paul stock, and have put it on the lists of the Boards, and made some quotations. They are not to be relied on, and the public will do well to obtain information regarding the property and its prospects before investing money in it. Governments all continue firm and active.

The following table will show the course of the stock, gold, exchange, and money markets since our last issue:

	May 3.	May 7.	May 10.	Advance.	Decline.
United States Sixes of 1881	108¼	109	109⅛	⅛	....

TOTAL DIVIDENDS paid - - - - - -	419,000
TOTAL LOSSES paid - - - - - - - - -	944,042

NEW FEATURES—NEW TABLES,

By which all Policies are NON-FORFEITING and ENDOWMENT, payable at about the same cost as ordinary Life and Ten-Payment Policies payable at death only. We call special attention to these Tables as exceedingly attractive and ORIGINAL with the UNION. In case payments are discontinued, after two premiums have been paid, the Company contract to pay, AT DEATH or the SPECIFIED AGE, an amount in proportion to the number of premiums paid.

The Percentage system of Dividends used by this Company affords greater protection to the family than any other plan, as in event of an early death the amount of policy paid is twice that paid by all cash Companies with the same cash outlay of premiums.

The greatest possible liberality in assisting parties to keep their Policies in force.

Liberality and promptitude in the settlement of claims.

We refer to the Massachusetts and New York Insurance Commissioners' Reports for 1864 and 1865 as an evidence of the Safety, Reliability, and Unparalleled Success of the Union Mutual.

J. W. & H. JUDD, GENERAL AGENTS.

Articles designed for all who want the best goods, ful weight. Sold by best Grocers everywhere. Each package bears the name of JAMES PYLE, Manufacturer, New York.

PARLOR AND CHURCH ORGANS AND MELODEONS.

MESSRS. CARHART & NEEDHAM, established in 1846, are the oldest manufacturers of the improved Reed instruments in the United States, Mr. Carhart being the inventor and patentee of all the essential improvements which have been made in these instruments up to the present date.

They have been established over twenty years, during which period they have manufactured a vast number of instruments of all classes; and wherever they have been exhibited in competition with the instruments of other makers, they have invariably taken the highest premium.

THE LAST TRIUMPH OF CARHART & NEEDHAM.

At the Fair of the American Institute held in New York in 1865 CARHART & NEEDHAM received the SPECIAL GOLD MEDAL over all the other instruments placed there in competition. The judges were Dr. Wm. Berge, C. B. Seymour (critic of the New York *Times*), Thomas Appleton, celebrated organ builder of Boston, George Jardine, also a well-known organ builder, and Dr. E. Ringer, an expert in the business.

EXTRACTS FROM THE SEVERAL REPORTS OF THE JUDGES.

From Report of Dr. Wm. Berge.

"The quality of the tone is the best I have ever heard, and the number of stops surpassed my expectations. The delicacy of *touch* and the quickness of *speech* are remarkable. In fine, I consider the Parlor Organ of Messrs. CARHART & NEEDHAM to be the best on exhibition, and therefore entitled to the highest award of the Institute."

From the Report of C. B. Seymour.

"The undersigned thinks it proper to suggest that CARHART & NEEDHAM should receive a Special First Premium for their large Parlor Organ."

From Report of Thomas Appleton.

"No. 526 is the best for the following reasons: 1st, It contains more reeds and of greater variety than any other. 2d, The reeds are placed above the key-board, thereby allowing a greater volume of sound to be heard. 3d, The successful application of the swell, which makes this instrument resemble the church organ more nearly than any previous arrangement. 4th, The voicing of the reeds is remarkable, and in the smoothness and quality of tone they resemble pipes more than reeds. The instrument is undoubtedly superior to any ever before constructed with reeds."

From Report of George Jardine.

"To the honor and credit of the United States of America a native American citizen is the first in the world who has discovered and demonstrated that not only can these vibrating tongues or reeds descend lower in the base, but of the very finest quality of tone, rich, round, and full, of quick articulation and free from *windiness*, right down to the 32 feet tone of C C C C. No doubt the fame of these gentlemen and their discovery will very soon and deservedly be circulated among the makers of Reed Organs in the world."

From Report of Dr. Ringer.

"No. 526 is the best for the following reasons: For its superior softness, evenness, and power of tone, being less ready than in any instrument I have examined. 2d, For the great number of keys of different character of tone, which give the player an almost infinite variety of combinations."

THE GOLD MEDAL.

From Watson's Weekly *Art Journal*.

"AWARDS TO MUSICAL INSTRUMENTS.—A gold medal was awarded at the late Fair of the American Institute to CARHART & NEEDHAM for the best reed instrument on exhibition—a very just testimonial."

"They are an exceedingly good substitute for an organ, and I can speak of them in the highest terms."—GEO. W. MORGAN.

"I have found them to be the *finest instruments of the class I ever saw*."—GEO. F. BRISTOW.

"They are entitled to be ranked as the *first* and *best* among instruments of their class."—WM. A. KING.

"*The tone is incomparable*, and they are *far in advance* of any other instrument of a similar kind."—CHARLES FRADEL.

CARHART & NEEDHAM

manufacture and are prepared to export Reed Organs of all classes for Parlors, Lodge-rooms, and Churches.

Price List and Illustrated Catalogue sent free.

STEINWAY & SONS'

GRAND, SQUARE, AND UPRIGHT PIANO-FORTES

Have taken Thirty-two First Premiums, Gold and Silver Medals, at the Principal Fairs held in this country within the last ten years, and in addition thereto they were awarded a First Prize Medal at the Great International Exhibition in London, 1862, in competition with 269 Pianos from all parts of the World.

That the great superiority of these instruments is now universally conceded is abundantly proven by the FACT that Messrs. Steinways' "scales, improvements, and peculiarities of construction" have been copied by the great majority of the manufacturers of both hemispheres (AS CLOSELY AS COULD BE DONE WITHOUT INFRINGEMENT OF PATENT RIGHTS) and that their instruments are used by the most eminent pianists of Europe and America, who prefer them for their own public and private use, whenever accessible.

STEINWAY & SONS direct special attention to their

PATENT AGRAFFE ARRANGEMENT,

which, having been practically tested in all their grand and highest-priced Square Pianos, and admitted to be one of the greatest improvements of modern times, will hereafter be introduced in EVERY PIANO MANUFACTURED BY THEM WITHOUT INCREASE OF COST to the purchaser, in order that ALL their patrons may reap its benefits.

STEINWAY & SONS' PIANOS are the only American instruments exported to Europe in large numbers, and used in European concert-rooms.

WAREROOMS, 71 & 73 EAST FOURTEENTH ST., between Union Square and Irving Place, New York.

Topics of the Day.

THE charges which are brought against the Freedmen's Bureau by the President's investigating agents, Generals Steedman and Fullerton, found their way into print, in advance of official publication, in the letters of a New York *Herald* correspondent. The gist of them is that certain Bureau officers in North Carolina have not only used freedmen with cruelty, and imposed on them exorbitant fines for trifling offences, but have also been speculating in cotton raising, turpentine gathering, and in lumber, and have taken undue advantage of their official position in hiring laborers. To these letters General Howard replies, putting in a general but emphatic denial of the charges of cruelty, and declaring that his officers have done well, indeed have obeyed orders, in giving practical proof to the doubting and faithless that plantations can be cultivated by free labor—a truth not long since generally scouted in the Southern States. Misrepresentation of the Bureau, he says, is to be expected. General Howard, it may be added, is quite well acquainted with the opinions of General Fullerton, who was once employed by him as a subordinate. It can hardly be true that Southern men dislike the Bureau mainly because its officers hire plantations and work them. The favorite Southern scheme of a Bureau last summer was, that the Bureau officers in each district should be Southern gentlemen engaged in planting, with practical knowledge of the negro, not with merely visionary theories.

WE are every day supplied with fresh materials for judging of the state of things likely to prevail at the South after the troops are withdrawn. Within a week Mr. Bardwell, the agent for the American Missionary Association in Mississippi, was enticed into a law office in Grenada in that State, and savagely beaten. On going before the mayor to complain, he found his principal assailant had already been there, and had complained against himself, and been fined ten dollars and discharged. Lieutenant Blanding, the agent of the Bureau, assisted Mr. Bardwell with his advice, and was soon after murdered in the street. The value of laws which are administered by such worthies as the mayor of Grenada is apparent to everybody. We agree with Northern conservatives in thinking that these tigers will eventually lose their tigerishness, and become sober Christian men, decent citizens of a civilized country; but we object in the strongest manner to having any class of persons, either white or black, exposed to their claws and their gambols during the transition process. It makes little difference to men like Mr. Bardwell personally whether the ruffians of Grenada will be better or worse ten years hence than they are now. What he wants, and what all persons who go to the South on their lawful occasions are entitled to, is protection for life, limb, property, and liberty now, and as long as the State laws withhold it we maintain that it is for the purpose of affording this protection that the Union exists. It was to secure this that the colonies revolted and the rebellion was put down, and not to provide a post-office merely and a debating hall in Washington.

MR. HENRY A. SMYTHE has at last, after much trouble and some tribulation, been confirmed in that, by politicians, most desired of all government posts, the New York Collectorship. The accounts of his political opinions vary—the point in doubt being the extent to which he approves of the "President's policy;" but on the most important point of all there is general agreement. He is beyond question an honest man, and has had no training in the working of party machinery, and will therefore, *if let alone*, make the New York Custom House a credit to the country, which it can hardly be said to be at present.

"HEAD CENTRE" STEPHENS has arrived in New York in search of that army of 200,000 men which he informed his friends in Paris he was about to lead back to Ireland. He has deposed Colonel O'Mahony from the post of honor and profit which he held in Union Square, and the great question of what became of the money which this last-named chief received is now undergoing examination. Eleven thousand dollars are said to be all that remains in the treasury; the remainder having been expended mostly in "secret service," the nature of which, of course, it would be improper to divulge. The most singular incident attending Stephens's advent is the tranquillity which reigns amongst the New York Aldermen and Common Councilmen.

ON the 16th of April, President Johnson had a long talk with a correspondent of the London *Times*, and made a full exposition of his present opinions. A part of what he said the correspondent felt at liberty to repeat. "These men," was the term by which "he always designated the radical party" during the interview. These men could hardly be blamed for pursuing their object—the exclusion of the South—with so much eagerness; they knew that when the South came back their day was done. Their talk of philanthropy was a pretence; they wished to work on the feelings of the North. These men had been busy for months incrusting the public mind with falsehood, but the truth would prevail, and the President instanced the case of Peoria and other places where meetings had been held to endorse his policy. These men knew nothing practically of the condition of the South. The very man who drew up the civil rights bill had remained in the Senate, while he had gone to Tennessee and seen everything. They passed the bill, however, and soon the sight would be seen of a judge under arrest for obeying the law of his State. The course of these men in reference to the negro could only lead to a war of races, and then, of course, the black race would perish. Congress represented the States, but the men who voted for them individually *all* voted for him. The Freedmen's Bureau had established another form of slavery, only it was abolitionists who managed it, and got the benefit of it. A Southern man could not get negroes taken down South for him, but a Northern man in the South could. These men wanted power, while he had gone the round of all the offices, and had nothing more to wish

for. The Presidency, now, was thought a great position, but he was often in the White House twelve hours without its ever occurring to him that he was President. The correspondent thought Mr. Johnson an honest man who had no personal ends to serve. The sum and substance of Mr. Johnson's statements was, in fact, that he is himself one of the most honest, pure-minded men living, and that those who differ with him are hypocrites and traitors.

Mr. H. J. Raymond, as the legislative agent of a body of citizens, has been addressed in a sharp letter by one of the latter—Mr. Sinclair Tousey, in which an inventory of his Congressional services is taken, showing him to have been guilty of thirty-five sins of omission, together with others of commission. Mr. Tousey concludes by an intimation that Mr. Raymond's further employment in his present duties will not be required by those who elected him.

The Massachusetts Senate has just defeated a bill which had passed the lower House, providing that the bounty of every State volunteer should be made equal to the highest bounty paid. No doubt many men voted for the bill because they thought the claim of the soldiers equitable. Others, it seems likely, voted for it because, not to put too fine a point on it, they were afraid that the soldiers as a class would be the political enemies of all members who did not support the measure. It is not in Massachusetts alone that there are men who seem to forget that our soldiers were American citizens before the war, and now, since the war, are American citizens again. They do not go by regiments to the support of any policy, and when they do it will be for some better reason than merely because they are regiments; it will be, we believe, because the policy commends itself to them as reasonable and just.

The English reform bill passed a second reading, as we intimated, and not passed the House as the telegraph reported, by five majority, which is equivalent to defeat. Lord Russell, it is believed, will resign. The question now is, whether the Tories will be able to form a cabinet. They are already trying to seduce some of the present ministers into a coalition against the great enemy of all—John Bright. Lord Granville may be won over, a result for which the *Times* is probably working. Lord Stanley would, should this arrangement be successful, be the leader in the House of Commons, and there is a rumor of Disraeli going to the Lords. Mr. Lowe is entitled to the credit or discredit of having killed the reform bill by his speeches, which roused the passions of his audience into fatal activity. He characterized democracy as a system under which the poor govern the rich, and, if they please, live on them, and the cry of property in danger being once raised, Mr. Gladstone's supporters ran into the opposition like frightened sheep.

The aspect of affairs on the European continent is very warlike. Austria, Italy, Prussia, Bavaria, Saxony, are all visibly preparing their forces for a great European war. Of course, all pretend to be acting on the defensive. Italy became frightened by Austria's armaments against Prussia, and cannot help concentrating troops west of the Mincio and south of the Po. Austria is therefore afraid of an invasion of Venetia, and, in spite of her agreement to disarm, compelled to augment her army in that province. This Prussia regards as a continued menace, and she, too, pushes forward, instead of suspending, her military preparations. In this way, in spite of the loudly proclaimed repugnance of the people to plunge into a fratricidal struggle, Germany seems to be drifting into a bloody war. The Italian people, on the other hand, is eager for the conflict. On the 30th of last month, the Chamber of Deputies unanimously voted a bill authorizing the Government to incur the requisite expenditures for the defence of the State, and to provide by extraordinary means for the necessities of the treasury. The war enthusiasm pervades alike all the provinces of the Peninsula. The Italian armaments are said to be carried on a large scale. The Italian fleet is reported to have left Genoa, destination unknown. The Austrian army in Venetia is estimated at about 150,000 men, which is more than enough for defence as long as France remains neutral. The intentions of the latter power are, of course, as yet undivulged.

CONGRESS.

Washington, May 12, 1866.

The great feature of this week has been the passage by the House of the constitutional amendment embodying the first portion of the congressional plan of reconstruction. The heavy majority by which this measure was carried through—receiving 18 more votes than the requisite two-thirds—evinces the fact that the Union party has been toned up rather than down by the steady opposition of the President. The amendment even secured two votes which were cast against the civil rights bill, while it lost no vote which that measure received.

By an unexpected pressure of the previous question—in which fifteen of the leading Democrats joined forces with Thaddeus Stevens and the radical Republicans to force the undivided issue upon the House—a large minority of the Union members were prevented from voting against the third section, or the clause disfranchising all the late rebels until 1870. Much dissatisfaction is the result, and the question of rejecting this portion of the amendment is to be tried in the Senate. From fifty to sixty Republicans are known to be opposed to it, though from different and sometimes opposite reasons.

The Senate is still far behind the House in the active business of the session. More than a week has been consumed in mere electioneering speeches, but this, it is hoped, has at length come to an end, by the final vote yesterday, leaving the President's power of removal where it was. There is some prospect that an independent measure, curbing the use of this proscriptive power independently of the Senate, will pass disconnected from the appropriation bills.

DIARY.

May 9.—In the Senate, a House resolution appointing a commission to select a site for the New York post-office, was passed. Also, a bill to incorporate the National Theological Institute. The bill to prevent the introduction of cholera into the ports of the United States was discussed by Messrs. Chandler, Edmunds, and Sumner in its favor, and Mr. Morrill against it. The rest of the day was consumed in political speech-making.

In the House, the constitutional amendment of the committee of fifteen was defended by Messrs. McKee, Spalding, Eliot, Miller, and Boutwell, and opposed by Messrs. Shanklin and Eldridge. Mr. Raymond spoke in favor of the amendment, excepting the disfranchisement clause. The tax bill was debated and amended.

May 10.—In the Senate, House bill to authorize the coinage of five cent pieces, and the withdrawal of all fractional currency below the value of ten cents, was passed. Also, House bill imposing a duty of 20 per cent. on live animals imported from foreign countries. The bill to prevent introduction of cholera was opposed by Messrs. Grimes and Harris, and defended by Mr. Edmunds. Messrs. Nye and Doolittle made political speeches.

In the House, the constitutional amendment was opposed by Messrs. Randall, of Pennsylvania, Strouse, and Rogers, and defended by Messrs. Banks, Eckley, Longyear, Beaman, Farnsworth, Dawes, Bingham, and Stevens. It was then passed—yeas, 128; nays, 37. Adjourned to Monday, May 14.

May 11.—In the Senate, the bill to prevent introduction of cholera was opposed by Mr. Johnson, and defended by Mr. Sumner. Messrs. Howard and Cowan made political speeches. The vote was taken on the reconsidered amendment to the post-office bill, withholding salary from the successors of officers removed by the President without consent of the Senate, and the amendment was lost—yeas, 16; nays, 23. Adjourned to May 14.

THE FREEDMEN.

There continue to be large numbers of freed people at Fortress Monroe and Hampton, but the demand for hands is reducing them. A large number of orphans are about to be transferred from the vicinity of the fort to Mr. De Mareil's farm-school near Washington.

The report that Bureau officers in North Carolina were engaged in private enterprises was probably founded on the fact that many ex-officers of the army have settled in the State and are working plantations, and that some of these officers have been appointed agents of the Bureau without pay, just as, in some localities, loyal resident planters have been appointed agents.

Gen. Fisk reports 48 schools for freedmen, in which there has been an average attendance of 8,180 scholars and 131 teachers. He states that some of the largest planters have established schools on their plantations. During the month of March, only 194 freed people received rations in Kentucky, and 225 in Tennessee, and these were old and sick and orphan children. Gen. Fisk telegraphs from Memphis that the school-houses destroyed by the riot will be rebuilt within ten days, and the schools resumed.

—A free woman of color has recovered $4,386 damages for violation of trusts, in the Freedmen's Court at Nashville.

Notes.

LITERARY.

THE late Count Gurowski left behind him an immense mass of manuscripts, consisting of correspondence with the notabilities of this country and Europe, besides a great many unpublished memoranda of his own. It is reported that this material will be arranged and edited for the benefit of a surviving daughter.

—Before the discoveries of Grant, Speke, and Baker can produce any very practical results, it is necessary that more shall be known than is at present of the languages of the Nile countries, a fact of which the Catholic missionaries are well aware, as they are of most things which are calculated to advance the interests of their Church. They have done much in past times to make us acquainted with the languages of Central Africa, to which can now be added the Dinka language, which is spoken in the districts of the Upper Nile, from 9° to 12° on the eastern bank of the rivers, and from 5° to 10° on the western, embracing a region of from three to four hundred miles in extent. Of this language Herr Mitterrutzner, a Catholic missionary, has just published a grammar, to which he has appended a Dinka, German, and Italian dictionary.

—The report which obtained currency some time since, that Gustave Doré was making illustrations for Tennyson's "Idyls of the King," which he cannot read, by the way, in the language in which it is written, turns out to be true, we are sorry to say, for if there is any one thing which Doré cannot do, we fear it is to illustrate Tennyson properly. Browning he might, or that portion of Browning which is represented by such poems as "Childe Roland to the Dark Tower Came," having much in common with his dark, weird, and irregular genius. What must be, must be, however, and Moxon & Co., Tennyson's publishers, are negotiating with Doré for his drawings, which are thirty in number. They are to be engraved in London, we cannot see by whom, unless it be by the Dalziel Brothers, and will probably be ready for the next holiday season.

—While the attention of his countrymen was directed towards him on account of his Edinburgh speech, and while their plaudits were ringing in his ears, Thomas Carlyle suddenly found his home turned into a house of mourning by the death of his wife. Taking her customary drive in Hyde Park on the afternoon of Saturday, April 21, her favorite dog was run over while running by the side of the brougham. Much alarmed, though the dog was not seriously injured, she lifted him into the carriage with her, and the coachman drove on; not receiving any direction from her, as he expected, he stopped the carriage, and, looking in, discovered her in a fit, as he thought, so he drove to St. George's Hospital, which was near by, but she was dead when he arrived there.

—Messrs. Strahan & Co.'s list of new works in preparation is the largest that we have lately recorded. It is as follows: "The Boyle Lectures for 1866," by Prof. E. H. Plumptre; "The Prophet Jonah: his Life and Mission Illustrated and Applied," by the Rev. Hugh Martin, M.A.; "The Philosophy of the Conditioned: Sir William Hamilton and John Stuart Mill," by the Rev. Henry Longueville Mansel, B.D., professor of philosophy, Oxford; "Thoughts and Opinions," by Matthew Browne; "Biographical Studies," by Bessie Rayner Parkes; "The Higher Education of Women," by Emily Davies; "The Letters of Eugénie de Guérin;" "Dealings with the Fairies," by George Macdonald; "The Washerwoman's Foundling," by William Gilbert; "The Will-o'-the-Wisps are in Town," by Hans Christian Andersen; an illustrated edition of Jean Ingelow's "Studies for Stories;" "The Romance of Charity;" "Peeps at Foreign Countries;" "Errands of Mercy;" "Truth in Tales;" "The Discoveries of the Astronomer revealing 'God's Glory in the Heavens';" "Lives and Deeds worth Knowing About;" "Chapters in Science for Boys;" "Edwin's Fairing;" "Æsop's Fables, with one hundred illustrations by eminent artists;" a new, revised edition of "The Regular Swiss Round," by Harry Jones; and a series of popular "Treasure Books," as—"The Treasure Book of Devotional Reading;" "The Treasure Book of Praise and Thanksgiving;" "The Treasure Book of Consolation for the Afflicted;" "The Treasure Book of Scripture Facts;" "The Treasure Book of Good Men's Prayers;" and "The Treasure Book of Counsel for Family Guidance." Many, probably the most, of these books will be manufactured here.

—The memory of William Henry Ireland, the Shakespeare forger, was lately revived for a moment in London at the sale of a library of Shakespeare literature, in which was a copy of Ireland's own collections relative to his forgeries, and a manuscript of his "Confessions" in his own handwriting. The value of the latter, which could never have been much at any time, was not enhanced by the fact that several similar copies of it are known to exist in England. We have somewhere read that Ireland supported himself in the last years of his life by making manuscript copies of his forgeries, each one of which was, of course, the genuine original Simon Pure. We believe one of these copies was sold here when the library of Burton the actor came to the hammer; and we know of another which, in addition to Ireland's own balderdash, contains a number of poems in the autograph of his mother.

—A valuable collection of scarce books, mostly rare volumes of early English poetry, will soon be sold in London, in the shape of the entire stock of Joseph Lilly, with whom works of this class are a specialty, and whose admirable catalogues are well known to collectors in this country. The collection in question is probably the richest one in England, abounding, as it does, in books which are rare in the strict sense of the word. Its acquisition was the result of many years; of a bibliographical knowledge such as is not usually possessed by dealers in old books; and of a very large outlay of money. If Lilly set his heart on a book at a sale, it was almost useless to bid against him, for he would have it at any price. He purchased, for instance, a large portion of the library of the late George Daniel, among other things Daniel's unique collection of black-letter ballads, for which he paid over seven hundred pounds. His own sale will witness prices not often paid in England, and some of the highest of them, we are certain, will be from American buyers, who are rapidly drawing hither the scarcest books in the language.

—Messrs. Bell & Daldy, the successors of the late William Pickering, have in preparation a new edition of the "Aldine Poets," which are every year becoming scarcer. The series, which is rather noted for beauty than accuracy, has been revised throughout, new biographies of several of the poets having been written, and the text generally corrected by the original editions. There are to be two editions, both printed from type, a limited one on small paper, and one on large paper, of two hundred and fifty copies, one hundred of which are destined for this country. They will be sold only by subscription, Messrs. Robert H. Johnson & Co., of this city, acting as the American agents of Messrs. Bell & Daldy.

—That the copyright law is respected in England, in its most minute particulars, is certain, as has just been shown by a case in chancery. The publisher of the *Illustrated London News*, as its American purchasers know, is in the habit of issuing double, triple, and even quadruple numbers of that journal for Christmas—one feature of which, and probably the greatest, is a large chromo-lithographic print from a painting by some popular artist. These illustrations are often beautiful, the one of last Christmas, a touching realization of "The Children in the Wood," from a painting by C. Lucy, the copyright of which was purchased by the proprietor of the London *News*, being especially so. It was popular enough in England to justify a pirated copy of it, which was manufactured in Germany, and which sold largely in London. The proprietors of the London *News* discovered the fact a month or two since, and obtained an injunction against the house who circulated the pirated print, who were ordered to deliver all the unsold copies to be cancelled, to pay over the profits on those already sold, and to pay all the costs of the suit. The decision, which was certainly a righteous one, will be a good precedent against all future infringement of the law in regard to prints taken from paintings.

—Among recent deaths in England may be mentioned that of John Scandrett Harford, who was said to have been the hero of Hannah More's religious novel, "Cœlebs in Search of a Wife," and who was known as a writer by a "Life of Michael Angelo" and a "Life of Dr. Thomas Burgess, Bishop of Salisbury." He died at his residence, Blaize Castle, at the ripe age of eighty-one.

—The expenditures of the British Museum during the past year amounted to over half a million of dollars, viz., £101,808 14s. 4d., and the sum required for the present year is estimated at a larger figure. The number of persons, exclusive of readers, who visited its general collections during the twelve months was 369,967, and the number of readers 100,271—a daily average of 349, each reader consulting twelve books daily. Valuable acquisitions have been made to the department of Oriental, British, and mediæval antiquities and ethnography, and the Greek and Roman departments have been enriched by a number of antiquities from the Pourtalis sale. Prof. Owen reports 16,700 additions to zoölogy, 10,079 to geology, and 3,628 to mineralogy.

SCIENTIFIC.

Exhaustion of the English Coal-fields.—The question as to the endurance of the supply of coal in Great Britain, which has been much discussed in the periodical literature of that country during the last three or four years, seems at last to have been fairly brought home to the English mind, when Mr. J. Stuart Mill declared in the House of Commons, "in a manner which riveted attention," that the exhaustion of the English coal-fields is a question not of centuries, but of generations. Mr. Mill cites the conclusion of Stanley Jevons, "that if the present rate of consumption of coal continues, three generations at the most, or very possibly a considerably shorter period, will leave no workable coal nearer to the surface than 4,000 feet in depth; and that the expense of raising it from that depth will entirely put it out of the power of he country to compete in manufactures with the richer coal-fields of other countries." Mr. Mill goes on to say: "I think, then, that if there be any one in this House, or out of it, who knows anything which will invalidate these conclusions of Mr. Jevons, it will be right of him to come forward and make it known. I have myself read various attempts to answer Mr. Jevons; but I must say that every one, admitting the truth of everything said, has only made out that our supplies will continue a few years longer than Mr. Jevons has assigned."

This question is one of the greatest possible interest to Americans, in view of the enormous extent of our undeveloped deposits of coal, from which, profiting by the experience of England, and guarding against the shameful extravagance with which her mineral wealth has been squandered through unintelligent use, we may continue to draw the sources of power for ages. It was, by the way, the keen eye of an American savant that first foresaw the coming of the English dearth. If we remember aright, it was Prof. Henry D. Rogers, of Pennsylvania, now of Glasgow, who some years since pointed out the speedy exhaustion of the British coal-fields.

There is consolation in the belief that, however much the exhaustion of its coal mines may affect the prosperity of any single country, the event will not be likely to impede materially the progress of civilization or to lessen the comforts of mankind. After the English mines have been dug out to such an extent that it would cost more to go deeper than it will to bring coal, or products resulting from the use of coal, from other countries, many English manufactures must, of course, be given up. But it is certain that long before all the coal in the world has been burned, other means of obtaining heat or power will have been developed, upon which mankind can fall back and prosper even if there is no more of the fossil carbon to be had. We should have still the scorching sun of the tropics, and every one who has once tried to escape from this merciless master will gladly see it subdued by the hand of man to be his servant, or, better, his slave; of its abundant power for good, if rightly managed, there can be no question. There is in the region of the trade-winds—in the wind itself—an amount of power always at command of which few men have any just conception; and the amount of water-power still to be had from rivers and tides is far greater than can be found in all the deposits of coal. Under the stimulus of necessity all these sources of power would be utilized by man, and to a degree now unthought of. As another source of power waiting, as it were, to be employed by mankind, there is the internal heat of the earth. Not that there is reason to share the sanguine anticipations of Buffon, who, as the story goes, had a scheme for warming the Jardin des Plantes, and even of producing there a tropical climate suitable for the disportment of monkeys, by means of hot water to be obtained by boring deep artesian wells. Yet is it not clear that the self-same power which will eventually check the working of the coal mines can itself be put to good use? The obstacle to mining which, more than anything else, will be difficult to overcome as the coal-pits are deepened, is precisely this internal heat of the earth. There are even now certain mines of metallic ores in England in the lower galleries of which the heat is so intense that work can be carried on only by naked miners, working by relays which release one another every few minutes. Here must be surely heat enough and power enough to be had for the taking.

In the course of the changes and oscillations of the civilization which is yet to be, it is in no sense unlikely, after all the coal of all inhabited countries shall have been burned up and have gone over into coral, that the New Zealander will find it to his advantage to make himself comfortable by means of heat obtained from holes in the earth which are now in process of excavation at the hands of barbarous Britons. But, not to look quite so far into the future, what a delightful summer watering-place England will soon be, when all her coal-smoke, business bustle, and pauper populations shall have disappeared, when only well-to-do people shall be found in her clean cities, and the country-places of great American merchants and manufacturers shall cover her now desolate mining and manufacturing districts with smooth lawns and stately parks!

Shiftings of Trade.—At the last annual meeting of the Birmingham Chamber of Commerce, the vice-president, Mr. Wright, made several curious and interesting statements concerning the trade of that town. It appears that during the last fifty years Birmingham has lost the custom of Italy, Spain, Belgium, and Switzerland, having been superseded in the trade with these countries by Belgium and France. France has now an amount of trade three times greater than was carried on by all England half a century ago. The first steam engines were built near Birmingham, in the factory of Boulton & Watt; but Birmingham is no longer the principal seat of this manufacture. Towards the close of the last century steel ornaments were very largely manufactured, and Mr. Wright asserts that he has in his possession pattern cards of steel ornaments from the old firm of Boulton & Watt which do not suffer by a comparison with the best work of the present day. Now the manufacture of these articles is almost entirely monopolized by the French, nearly twenty thousand persons being employed in it at Paris alone. The sword trade, also, has passed away from Birmingham to the continent of Europe. On the other hand, many new branches of industry have been introduced, and some old ones have increased in importance to a wonderful extent. The manufacture of yellow metal for sheathing vessels, of tubing for locomotive boilers, and of railway carriages, are examples.

Upon the necessity of cultivating in manufactories the art of designing and the science of chemistry, Mr. Wright makes some strenuous remarks. He insists that, in view of the kind of competition to which the Birmingham manufacturers are nowadays subjected by their Continental rivals, it has become as imperative upon all those whose works partake of the artistic element to found a studio within their establishments as it is to employ a foreman or cashier. As instances in point, the trades of the brassfounder, glass-blower, and maker of chandeliers are particularly specified. To meet this want, much has been done by founding a school of design, though it appears that out of 900 students at this institution only 170 were engaged in artistic trades. But in the matter of chemistry it would seem that Birmingham is still lamentably behind the age. Mr. Wright stated his belief "that in all Birmingham, which used annually a million pounds sterling of gold and silver, and half a million pounds in value of copper, and had nearly 400,000 inhabitants, there were not ten persons in the metal trades who studied chemistry with a view of making themselves better manufacturers." He asserted that "he had, during the last few weeks, seen metals, oxides, and bronzes, produced by the French and Germans, that had never been approached in Birmingham, and colored metals in imitation of gold which he had never been able to touch, although he had been in the trade for fifty years." He went on to relate the case of "a manufacturer [who] told his son, who was studying chemistry, that if he was not content with the trade as it was, he should have no part of it." That the condition of things here depicted will be found in the immediate future to be altogether incompatible with a successful resistance to that Continental aggression in matters of trade to which Birmingham is so much exposed, will be at once apparent to every one in any way familiar with the methods and habits of the large manufacturers of France and Germany. His townsmen have good reason to be thankful to Mr. Wright and to accept his timely warning.

The Scientific Investigation of Disease.—That very great benefit to mankind could not fail to be derived from any systematic, organized, and far-reaching effort to fathom the laws of disease, will be manifest to every one. Some months since a writer in The Nation, commenting upon the doings of the Smithsonian Institution, alluded to the importance of concerted action in this matter, and suggested that a central office for collecting, recording, classifying, and digesting all facts relating to the laws of disease should be somewhere established. It was urged that the very important results obtained by the Smithsonian Institution in the field of meteorology might be taken as an earnest of what could be accomplished if an organization similar to that of the Smithsonian, and methods of research analogous to those adopted by that institution, were applied to the study of epidemic diseases.

There is great force in these suggestions. No country is more interested than our own in such investigations. Vast tracts of our territory are cursed with fever and ague; yellow fever visits many of our ports almost every year; cholera and small-pox periodically alarm our crowded populations. Every year a large amount of valuable evidence is accumulated concerning the history of diseases, their origin and development, the manner in which they are carried, or in which they move from one place to another, the modes in which they are communicated, restricted, prevented, or cured. But this mass of information is presented in a diffused and, as it were, diluted form. As matters now stand, no one observer can see anything like the

whole of this evidence; each person obtaining, at the best, but a partial, one-sided view of the subject. There is needed some common centre into which each separate witness can throw, as into the focus of a glass, any ray of light which may have fallen unto him.

As the sources of force, by virtue of which the desired office or bureau should be established and maintained, we of course look, after the republican manner, mainly either to the united pecuniary contributions of physicians, or to moneys obtained at the instigation of physicians, or men of science, from the wealthy and philanthropic. But in Europe they do, or seek to do, these things in a different way. The subject has recently come up for discussion in England, as we have noticed since reading the article in THE NATION already referred to, and it is curious to see the expectation of help from the Government which animates those who have taken part in the discussion, as well as the manner in which this help is demanded, almost as if it were of the nature of a right. The *Medical Times and Gazette*, one of the leading journals in its department, says: "Let us then, by all means, have royal commissioners to help us in our investigations into disease; we shall gladly accept and avail ourselves of their aid. But is this all the assistance that medicine has a right to expect from a wealthy and enlightened Government? We think not!" "A Fellow of the Royal Society and of the Royal College of Physicians," in his pamphlet "On the Scientific Investigation of Disease in Animals and Man," suggests that Government ought to make grants of money annually for the scientific investigation of disease. He admits that of a great many grants made few would be productive of useful results, but holds that if, out of twenty men set to work, only one produced anything of value, this one success would abundantly justify the system, and he contrasts the case with that of experiments upon guns and ships, where vast sums of money are expended upon mere failures. The writer laments that "there is not yet a hospital in London in which there are efficient means for conducting scientific enquiries into the nature of disease." The remark may well be taken as a reproach in view of the enormous endowments of some of the metropolitan hospitals. However much we may disagree with this writer in the choice of methods, it must be admitted that any agitation of the subject is likely to be productive of good.

ECCE HOMO.*

THE title of this little book led us to expect a presentation to the public of the historical Jesus. It is the avowed purpose of the author to make such a presentation. He has undertaken, as he says in his preface, "to trace his biography from point to point, and accept those conclusions about him not which church doctors, or even apostles, have sealed with their authority, but which the facts themselves, critically weighed, appear to warrant."

Now, if there is anything the author has not done, it is precisely this. His book is in no sense a biography—a sketch of the life of Jesus. The facts of the gospel narratives do not seem to have been critically weighed; the gospel narratives do not seem to have been critically studied. There is no indication that the writer, though evidently a very accomplished and able man, is in the least acquainted with the critical literature of the New Testament, or has noticed even the broadest distinctions between the four Evangelists. Not only does he fail to sift, classify, digest, and arrange the facts he scarcely notices the facts. No incidents, or even events, in the life of Jesus are detailed. There is no historical sequence, no movement, no crisis, no career, no issue, no culmination, no catastrophe. There is no scenery, and there are no personages. The Christ himself is presented as a personage, and a most extraordinary one; such a one as no church doctors or apostles ever conceived. His image is drawn with great firmness and power, and stands out in colossal proportions, as that of a social reformer and statesman strangely endowed, wonderfully gifted, and marvellously inspired; a man historically linked with his age, the product of his age, in fact, and yet possessed of a genius that made him a man for all ages. But this image of the Christ is projected from the author's individual mind, and is simply illustrated by the way by the evangelical records. And the records get twisted a good deal in the process. For instance, he illustrates the importance which Jesus attached to the initiatory rite of baptism—an importance, we may say, that is assumed in defiance of the record—by the passage with Nicodemus. The "ruler among the Jews," he tells us, was ready to comply with Christ's demand of personal homage and submission, but wished to be excused from making a public avowal of it. He thought he could push the movement among the influential classes, and become a useful friend in the metropolis. If Christ would excuse him from publicly undergoing the rite of baptism, he believed he could cautiously dispose the Pharisaic sect to a coalition with Christ, on the ground of their common national and theocratic feeling; while, on the other hand, by submitting to baptism he would lose his influence with the authorities, and with it "all his power of becoming a nursing father to the infant church." These overtures the Christ summarily rejected, "by an abrupt declaration that there was no way into the theocracy but through baptism!" Again, speaking of the effect of personal influence in creating virtuous impulses, he cites the story of the woman taken in adultery. Jesus, he says, stooped down and wrote on the ground because he was so overcome by a sense of shame that he could not but hide his face. When at last he raised his head for an instant, it was his flushed, maidenly cheek, not his scathing sarcasm, that sent the accusers away. The volume abounds in similar arbitrary constructions.

We have said that the writer uses the gospel records merely for the purpose of illustrating the conception of Christ which he has fashioned by his own thought. He takes greater liberties than this. He sets aside the record altogether, even where its statements are the most conspicuous and unqualified. For their most overwhelming incidents he seems to substitute incidents of his own. We think we are justified in saying this by a single sentence, which must have been overlooked by those who have given such immoderate praise to this book not only on the score of its ability, but on the score of its historical conservatism. On page 119 we read: "This monarchy (of Jesus) was essentially despotic, and might, in spite of the goodness of the sovereign, have had some mischievous consequences if he had remained too long among his subjects, and if his dictation had descended too much into particulars. But he shunned the details of administration, and assumed only the higher functions of an heroic monarch, those of organization and legislation. And when these were sufficiently discharged, when his whole mind and will had expressed itself in precept and signed itself for ever in transcendent deeds, *he withdrew to a secret post of observation*, from whence he visited his people *for the future* only in refreshing inspirations and great acts of providential justice." We are at a loss to understand the meaning of this paragraph, if it be not that Jesus, instead of dying and leaving the world as the gospels say, revived after a seeming death and disappeared to pass the rest of his days as a secluded spectator of the work which his followers took up and continued. This is one of the solutions suggested by the rationalists to escape from the resurrection and ascension, and though it is one of the most arbitrary, the author seems to adopt it.

In a word, this book is not a biography, but a treatise, or rather an essay, on the work of the Christ. As such it is remarkable for its originality and its power. Christ, he says, formed one plan and executed it. This plan was to establish a universal monarchy; "to restore the theocracy as it had been in the time of David, with a visible monarch at its head, and that monarch himself." It was not his aim to reproduce the past—he was too wise for that; his notion of monarchy was different from David's; his ideal of a king was nobler than his countrymen entertained; but the royalty was substantial, and the authority absolute. "He declined to command armies, or preside in law courts; but higher works, such as imply equal control over the wills of men, the very works for which the nation chiefly hymned their Jehovah, he undertook in his name to do. He undertook to be the Father of an everlasting state, and the Legislator of a world-wide society." He assumed to be a person of transcendent greatness; he laid men under a personal obligation of loyalty; and on the ground of this loyalty he proceeded to form them into a society, and to promulgate an elaborate legislation, authoritatively delivered. In doing this he assumed the part of a Moses, and, "as he had no civil judges to enforce his legislation, he represented his unfaithful servants as being liable to prosecution before the tribunals of the invisible world." The details of this legislation are described in the twenty-four chapters which make up the second and larger part of this volume. We cannot touch on them now, but we can say honestly that his remarks on the Christian Republic, on the Christian as a Law to himself, on the Enthusiasm of Humanity or Positive Morality, and the Law of Philanthropy, Edification, Mercy, Resentment, and Forgiveness, show profound reflection and suggest grave thought. We meet with unwarrantable assumptions, as they seem to us, with forced interpretations, overstrained deductions, curious misconceptions; but we find also wise discrimination, penetrating sagacity, singular boldness, and a noble spirit. He is no mere moralist, no worshipper of the letter, even of the New Testament letter. He fully appreciates the difference between the age of Jesus and our own.

We are advanced by eighteen hundred years, he says, beyond the apostolic generation. "All the narrowing influences of that generation have ceased to operate." "The New Testament is not the Christian law: the precepts of apostles, the special commands of Christ, are not the Christian law. To make them such is to throw the Church back into that legal

* "Ecce Homo: A Survey of the Life and Work of Jesus Christ." Boston: Roberts Brothers. 12mo.

system from which Christ would have set it free. The Christian law is the spirit of Christ, that enthusiasm for humanity which he declared to be the source from which all right action flows. What it dictates and that alone is law for the Christian." Do the cautious say it is not safe to follow a mere enthusiasm? "If Christ is to be believed, it is not safe to follow anything else." Do some say that what is utterly absent from the New Testament cannot possibly be an important part of Christianity? "That is a great mistake, arising from a wide-spread paralysis of true Christian feeling in the modern Church."

The "Ecce Homo" has been ascribed to very high authorship. The name of Mr. William E. Gladstone has been mentioned in connection with it, on what authority we cannot tell. In point of intellectual ability it is worthy of any authorship. However defective and even perverse it may be in some particulars, it deserves to rank with the most remarkable books of this generation. It should be added that this volume contains only a portion of the author's studies on his general theme. Another volume on "Christ as the Creator of Modern Theology and Religion" is in preparation.

THE USURY LAWS.*

HALF Mr. Murray's volume is devoted to a sketch of the history of usury, or rather of the ideas regarding it, in vogue from the earliest ages to our own day. This forms, however, only an introduction to the latter half, which is devoted to an examination of the usury laws actually in force in the various States of the Union, and of the principles which govern the decision of cases in which these laws come into conflict. The chapter on the policy of the usury laws and their effect on commerce is composed mainly of a summing up of Bentham's famous essay, whose opinions our author shares.

The work may be useful even to lawyers, and by that great mass of readers whose information on economical questions comes mainly from the newspapers will be found both entertaining and instructive. Mr. Murray only claims for the book the merit of a good compilation, and he disarms criticism by an apology in his preface for the only feature of it with which fault can fairly be found, and that is the style, which is generally stiff and in some places clumsy.

We doubt whether his arguments against the usury laws will produce much impression on the class to whose influence these laws now in most States owe their existence—the farmers. This class in nearly every State holds the legislation in its hands, and for a variety of reasons cannot easily be brought to place money in the category to which modern economists assign it—a commodity, like any other. They are not in the habit of dealing in it as bankers and brokers and merchants are, and it has to them one characteristic which separates it in their eyes from all other articles of commerce, in being the only one which it is impossible to go without. Then again, most farmers are, in a certain sense, needy. They seldom possess much money. The rapidity with which the country has been settled, and the wide, and in many ways mischievous, diffusion over its surface which the agricultural population has undergone, leave vast numbers of them in possession of great crops, but without a market for them. The result is a very frequent recurrence of seasons of depression, when loans of money are an absolute necessity, and to propose to them to let money dealers at such crises have full swing amongst them would at present be useless. The "stay laws" so frequently resorted to in the West and South to retard the recovery of debts when due, but on which Mr. Murray has not touched, are in reality usury laws in their worst shape, being simply attempts to make the necessities or convenience of one of the parties to a bargain regulate the terms of the bargain.

THE GALAXY.

THE second number of the new magazine is a considerable improvement on the first, though we trust it is not yet by any means what it is to be. "The Claverings," of course, pursue the jog-trot tenor of their way. Rose Terry contributes an odd little Spanish song, "In the Hammock." The "March of the Cholera" is padding, containing nothing, except the preliminary reflections upon the pestilence, at all new. Professor Blot furnishes his second article on the "Art of Dining," but it hardly comes up to our expectations. On questions of cookery pure and simple his authority is not to be disputed, although he calls cookery a science, which he would not do if his ideas as to what science means were as clear as they might be; but on some points touching the digestion we shall venture to differ with him, by observing that it is not possible to lay down any rule as to the digestibility of things, constitutions differ so widely. Some people find nothing lighter or more grateful than cucumbers; to others they are little short of fatal. Therefore, the beverage which the professor recommends after soup and during the greater part of the dinner, composed of three parts water and one part wine, will probably not suit everybody. Whatever may be "known" as to the action of alcohol on the stomach, there are unquestionably large numbers of persons who find undiluted light wine the best dinner drink of all. "Archie Lovell" makes some progress. General Cluseret contributes a very interesting, but somewhat stilted, account of Victor Hugo's home at Guernsey. "Miss Clare" is another tale, but we must leave the lovers of fiction to find out what it is all about. The heavy article of the number is Miss Cobbe's "Fallacies of Memory," which is devoted to showing the utter untrustworthiness of all our records and of all our recollections of the past. The conclusion would be painful if it were not already tolerably familiar, and if the mass of mankind were not just as well pleased with fiction as with fact. "The Galaxy" must now "keep pegging away," as Mr. Lincoln said, and we shall only know six months hence what impression it has made.

Leighton Court. A Country-House Story. Henry Kingsley. (Ticknor & Fields, Boston.)—The scene of this brief story is an English country-house, and the actors are certain of the Devonshire nobility and gentry. Their business is a little flirtation, a good deal of love, with a view of matrimony, and the joining together of two respectable incomes; a little love that, followed far enough, may lead to the divorce court and damages; and, of course, some fox-hunting in a difficult country. In the background may be seen, by glimpses, both Houses of Parliament and the Indian mutiny. There is not an incident that has not long been worn threadbare, and all the characters are recognized as old acquaintances, unless we except Sir Harry, a madman, who dies of *angina pectoris*, after having been of the greatest service in tangling and disentangling the plot. The book was written in a hurry, and the author has made a novel not so ambitiously bad as the last one he wrote. He is slangy still, and too knowing, and he never was a thinker, and his effects do not spring from his causes any more than in old times, and his wit is only levity, and his humor an imitation that makes us uncertain whether to wish or not to wish for the originals of such copies; and it is true that one gets up from this, as from other Kingsley books, feeling that it is his blood and not his brain which the novelist has been addressing, or, at any rate, which has responded. But still the reader has much to be thankful for. We are spared all the cant of moral nobility, all the counterfeit fine sentiments that made us laugh a disgusted laugh over those Hillyars and Burtons. And the author's haste was not so great that he did not once in a while stay for a moment to exercise his old power. Not seldom he gives us a landscape, badly drawn, perhaps, but so that we feel the very air and see the sky and the green hills, the river, the ploughed land, and the full ditch.

The Field and Garden Vegetables of America. By Fearing Burr, Jr. (J. E. Tilton & Co., Boston.)—This volume is to the gardener what a manual of botany is to the botanist. It professes no more than to be "a manual or guide to assist in the identification and selection of varieties, rather than a treatise on cultivation." It contains short descriptions of over a thousand varieties of useful vegetables, with some notice of the proper soil and cultivation of the more important. The descriptions are in plain language, terse, and as satisfactory as the case will admit of. The preparation of such a work presents peculiar difficulties. Varieties are often separated by very slight differences, or are inconstant in their characters, or depend on local conditions, or are determined by such characters as can only be learned by actual observation, and cannot be well described in language; so that any attempt at description must be unsatisfactory. In this work the attempt has been unusually successful, and many of the more important varieties are illustrated by engravings from characteristic drawings by Sprague, who is, perhaps, the most successful as well as most eminent botanical draughtsman in this country. We could wish that these illustrations were more numerous, while some of the descriptions of varieties little cultivated or used might have been omitted without injuring the book. The plants are classified according to their uses, and while the botanical names are given, they are subordinate to the common English ones. The book is beautifully printed, is furnished with a good index, and is a valuable addition to our horticultural literature.

The Masquerade, and other Poems. By John Godfrey Saxe. (Boston: Ticknor & Fields.)—It is in one of Miss Edgeworth's novels, we believe, that a boy is warned of the great danger of setting up for a wit. In his devotion to small jokes, his mentor informs him, he will most likely fritter away his mind and at last discover that in "learning to trifle well" he has lost solidity of thought and depth of sentiment; like the grasshopper, while he does nothing but chirp, winter will overtake him, and be unprovided for. There are some jesting books which only illustrate this truism and tell melancholy truths of the jester; in which we get some notes of the summer merriment and more of the faint chirping of winter; in which the nipped sentimentality of the minor poet is seen side by side with the forced shallow wit that fostered its growth and did so much to prevent the growth of better things. In this book there is the facility of versification which is given by long practice, and there are some jokes that are very fair, and more that are rather pointless; one of the best is the author's way of winding up funny

* "The History of Usury from the Earliest Period to the Present Time, together with a Brief Statement of General Principles concerning the Conflict of the Laws in different States and Countries, and an Examination into the policy of Laws on Usury, and their Effect on Commerce." By J. B. C. Murray. Philadelphia: J. B. Lippincott & Co. 1866.

poems with morals, such as "Rely on yourself;" "Give a wide berth to a meddlesome man," etc. Perhaps the best piece in the book is "A mourner à la mode," and the poorest "Othello the Moor."

The Poetical Works of Thomas Hood. (G. P. Putnam; Hurd & Houghton, New York.)—This is a people's edition of the works of a very different genius from the foregoing. He never had the talent of coining his powers into a balance at his banker's, and the lot fell upon him of making jokes from day to day in order to get the day's dinner. It may have been because such a life was of necessity and not of choice that it produced in his case no worse effect upon his mind and soul. At any rate, after all his hard-working triviality and frivolity in the way of business, he was still good enough and great enough to utter such pleas for human misery as the "Bridge of Sighs" and the "Song of the Shirt," and to make a poem so delicate and so purely poetical as the "Fair Inez." This glory of being not only a poet but also a soldier in the great cause of humanity, he shares with another great wit who not long since was living. But it was in Heine's nature to break his heart because victory declared against him, and in Hood's rather because there was need of war. After his rare poetic power, his tender-heartedness and sweetness of temper are his chief charms, and the people do not forget these in reading even Hood's puns. There are two volumes in one in this edition, which makes the book seem rather thick in the hand, but in paper and print it is well adapted for its designated use.

The Works of the Rt. Hon. Edmund Burke. Revised edition. Vol. VI. (Little, Brown & Co., Boston.)—Of all the contents of the present volume of this excellent edition, the sketch of a negro code is the most curious for present study. It was originally devised by Burke in 1780, and was written out in its present shape for the Hon. Henry Dundas in 1792. It was one of the many futile attempts to cushion the imminent fall of a most atrocious traffic, and, later, of the system which fed it. Neither the abolitionists nor the West India planters were placated by them, and there was no recourse but to contend till one or other of the parties succumbed.

PARIS GOSSIP.

PARIS, April 27, 1866.

THE absurdities of the present style of dress among the least ugly half of creation were palpably brought out at last Sunday's races, the last of "the season." One fine lady wore an underskirt of bright pink silk, lavishly trimmed with *ruches* of black taffetas, the upper skirt, of black silk, entirely without folds, being as lavishly trimmed with pink. The head-dress which surmounted this rather striking pyramid (for it seems absurd to apply the word "bonnet" to anything so infinitesimal) consisted of a single vine-leaf of pink silk, laid flat on the top of the head, the said vine-leaf being edged with glass pendants, imitating dew-drops, and kept in its place by a pair of pink strings. Another rather striking toilette was of mauve silk, trimmed with cherry-colored velvet, the head-dress consisting of a few twigs twisted together and covered with the leaves, flowers, and fruit of the cherry-tree, and tied on, of course, with the orthodox pair of strings, the only feature now remaining of the "bonnet" of other days. The *coiffure* of another lady consisted of a "flat" of lilies of the valley, put on the summit of the head, and thence depending in long wreaths over the shoulders and half way down the back.

The last week has been crowded with soirées, concerts, and balls; one of the most brilliant being the magnificent entertainment given by the rich and pomp-loving old Duke de Larochefoucauld, who has just completed the repairing and beautifying of his grand old historic mansion, in the Rue de Varannes, and on this occasion exhibited to the *élite* of the Faubourg St. Germain the grandeur of his famous suite of drawing-rooms in the style of Louis XIV. The invitations had been issued for midnight, to allow the guests to dispose of the earlier part of the evening elsewhere, and the ladies were invited to wear powder. As the style of dress now in vogue is very similar to that worn at the French court in the days of the "Grand Monarque," the addition of powder completed the illusion, and gave to the salons in question almost the air of a *fête* of two hundred years ago. The grounds, brilliantly illuminated, offered the most charming perspectives through the wide, open windows; the terrace outside was bordered with a profusion of flowers. At four in the morning a splendid supper was served in the conservatory, whose walls were hidden by a hedge of magnificent camellias in full bloom. Green peas, asparagus, strawberries, cherries, and grapes figured in profusion on the tables, amidst the indescribable creations of artistic French cookery and the finest nectar of the well-stocked ducal cellar. Dancing was resumed after supper, and was kept up with unflagging spirit until eight o'clock.

The musical world is awaiting with much interest the appearance of Mercadante's new opera, "Virginia," about to be produced at Naples, whence it will be imported into this supreme "centre" of art judgment. Patti is going to London with a galaxy of other stars. Rossini has given two *soirées musicales* that have sent his guests into raptures; the first was ostensibly of Italian music, the second of French; at both various exquisite new compositions of his own were sung amidst the enthusiastic plaudits of all present, which plaudits the public is, unfortunately, not able to echo, the immortal *maestro* obstinately persisting in his thirty years' refusal to allow any new creations of his to be published.

Monsieur N. G. Bach, great grandson of the celebrated composer Sebastian Bach, one of the professors of the Paris Conservatoire, and for forty years past one of the most esteemed pianists of the capital, is just bringing out, under the auspices of Legouix, the well-known music publisher of the Boulevard Poissonnière, a song and a saraband which, according to his account of the matter, have come into his possession in the following singular manner:

According to this gentleman's statement, his son, M. Leon Bach, having discovered an old spinette, admirably carved, bought it and presented it to his father on the 4th of last May. After making a long examination of this interesting piece of antiquity, the father discovered on a board in the interior of the instrument an inscription stating that it was made at Rome, in April, 1564. He passed part of the day in contemplation of his precious spinette; he thought of it as he went to bed, and, having fallen asleep, he had the following dream: He thought that a man stood beside his bed, with a long beard, shoes rounded at the toes, and with large bows of ribbon at the instep; large, full breeches, a doublet with sashed sleeves, stiff collar, and a hat with pointed crown and broad brim. This person bowed to the musician, and said, "The spinette you possess belonged to me. It frequently served me to entertain my master, King Henry III. When he was young he composed an air with words which he was fond of singing, and which I frequently played to him. This air and these words he had composed in memory of a young lady that he once met in a hunt and of whom he became deeply enamored. She was taken away, and it is said that she was poisoned, and that the king was deeply distressed at her disappearance. Whenever he was sad he hummed this song, and then, to divert his mind, I played on my spinette a saraband of my composition, which he much loved. Thus I came to confound together these two pieces, for I was continually playing them one after the other." The speaker then appeared to approach the spinette, played a few notes by way of prelude, and sang the air with so much pathos and expression that M. Bach awoke in tears. He lit a candle, and looked at his watch; it was just two o'clock. He soon fell asleep again; but what was his astonishment, on awakening in the morning, to find on his bed a page of music-paper covered with notes, microscopically small and very fine writing. Being very near-sighted, he had great difficulty in deciphering them, even with the aid of his eye-glass.

He then tried the air on the spinette. The song, the words, and the saraband were exactly as he had heard them in his dream. M. Bach is no somnambulist and has never written a verse in his life. The song consists of three stanzas and a refrain, sweet, plaintive, and, in turn of expression as in orthography, exactly in accordance with the style in vogue in the reign of Henri III. The melody is simple, *naïve*, penetrating; and the style in which the music is written is as ancient as that of the spelling. The notes are of a different form from those of the present day, and the air is written in a different key from the bass, though intended for a man's voice. The three verses tell how the singer, "during the chase," seeing his lady love for the first time, thought he had seen an angel, and became the happiest of kings; how he would give "all his kingdom" to see her again for one instant; how, "sad and cloistered," his "pauvre belle" was far from him in her last days; and how, while "she no longer feels her cruel sorrow," he, "alas! suffers always." It is known that Henri III. had a great passion for Marie of Clèves, Marquise d'Isles, who died in a convent in the flower of her age, on the 15th October, 1574. Was she the "pauvre belle, triste et cloistrée," mentioned in these verses? It is also known that an Italian musician named Baltazarini went to France at that epoch, and became a favorite with the king. Did the spinette belong to Baltazarini? and was this the mysterious visitor who brought the song and the saraband to M. Bach?

It seems that Mlle Titiens, on her passage to Berlin and Hamburg, was induced to play four nights at Cologne. Though the prices were trebled the opera was crowded to suffocation, and numbers were unable to obtain admission. Many of those who were thus disappointed presented themselves at her hotel with a petition signed by over 7,000 persons, beautifully engrossed on parchment, together with a magnificent silver-gilt crown bearing the arms of Créfeld, Düsseldorf, Hanover, Minden, Essen, etc., begging her to visit each town for one evening only on her own terms. This, being engaged in London, she has been obliged to decline. At Cologne and Hamburg the great songstress has one-half of the total receipts, amounting frequently to 5,000 francs per night.

Articles on any of the subjects usually discussed in this journal will be received from any quarter. If used, they will be liberally paid for; if rejected, they will be returned to the writers on the receipt of the requisite amount of postage stamps.

THE MORAL OF THE MEMPHIS RIOTS.

THERE was one feature of the late riot at Memphis which is worthy of attention from its bearings upon the political status of the negroes. It appears by the more recent and trustworthy accounts of the affair that it began in an unsuccessful attempt made by the police to put a stop to the disorderly conduct of some negro soldiers. The row which followed was taken up by the citizens at large, and when renewed in the afternoon, after a short pause, it took the form of a general massacre of such of the colored population as showed themselves in the streets. This part of the tragedy appears to have been inconceivably brutal, but its brutality was, after all, not the most remarkable thing about it. Its most novel and most striking incident was, that the *police* headed the butchery, and roved round the town either in company with the white mob or singly, and occupied themselves in shooting down every colored person, of whatever sex, of whom they got a glimpse. In the half-organized attack made on the fort, also, the police were the principal assailants.

We are not going to furbish this occurrence up into an argument for the wholesale disfranchisement of the South, or for any greater severities against her white population than we are now inflicting upon them. Anybody who expects Southern whites and blacks to settle down into their true and just relations to each other without breaking one another's heads a good deal, knows little either of history or human nature. There will prevail at the South for a long time to come a good deal of envy, hatred, and malice towards the colored population, and they will show themselves in riots and outrages more or less flagrant. What was peculiar about the Memphis riot was that the officers of the law, the very persons on whom the colored population will have to rely for protection as soon as the troops are withdrawn, took a leading part in it, and we have very little doubt that, were any similar outburst of popular prejudice to take place to-morrow in any other town in the South, the local police, if they interfered at all, would interfere in the same way. "They would stand by their race," as Mr. James T. Brady once said, in a speech before the war, when Northern Democrats were trembling lest the Southern blacks should break loose, come North, and eat them all up. The negro would, when pursued by a mob, avoid "the guardians of the public peace" as vigilantly as he would any of the pack at his heels. We grant that under the State law and under the Federal law he would have his remedy against all his assailants. He could sue them either civilly or criminally, or both, for assault and battery, or assault and false imprisonment, or for a felonious assault. If his house was burnt or his furniture damaged by a popular rising, he could sue the county for damages. He might get a verdict, and he might not. We will suppose that he would; but which of us would live in any community where this was our main reliance for protection against mob violence? Which of us would keep our families in a town in which not only we were objects of popular odium, but in which, if an attempt were made to mob us, we might expect to see the policeman who patrolled our street taking the first pop at us with his revolver, or the sheriff of the county heading a party charged with the duty of ramming in our front door?

When the Freedmen's Bureau bill and the civil rights bill were first talked of, one of the strongest arguments used against them by their opponents was that they were unnecessary, that "the laws of political economy" would eventually secure protection for the negroes from their white neighbors themselves without any interference on the part of the Federal Government. No matter how much their old masters might dislike them, the necessity of employing them, of relying on them for prosperity and comfort, would sooner or later make the relations of the two races, if not cordial, at least amicable. The negro had only to wait a little and all would be right by-and-by. We always thought there was something in this argument, but we nevertheless always considered it a most ridiculous argument when addressed to the blacks themselves. It was substantially this: "Your white neighbors are at present greatly incensed against you. They consider you the cause of all their troubles, and look upon themselves as having been robbed of your services. Therefore, for some time to come, they will probably maltreat you a good deal. They will most likely rob and murder you frequently; and more frequently they will flog you and deny you justice in the courts. Your house will, probably, be burnt now and then, and you will be driven from one part of the country to the other by mobs. But you must not mind this. They will get over their feelings toward you after a while, and get used to seeing you free, and then they will most likely let you alone, or at least not annoy you so much. The laws of political economy are all working for you, and you know whenever you want to travel abroad you can have a United States passport. In the meantime pay your taxes regularly, and put your trust in Providence. The Federal Government can do nothing else for you." The negro might very naturally reply that he cared nothing for the laws of political economy; that what he wanted was the protection of the Government to which he paid his taxes and owed his allegiance; that very likely the whites would get used to him after a while and let him alone, and, whenever that time came, of course he would not need any protection. But that it is precisely at those periods of a man's life when his neighbors do n't like him, and want to attack him, that governments and police are needed, and that for any government to announce that it could do nothing at these crises was to destroy its sole claim on his fidelity.

This gap has been stopped by the civil rights bill. It forces the State either to protect its own colored population or let the Federal authorities do it. But the riot at Memphis reveals another gap which no legislative enactment can stop that does not in some way make the officers of the law responsible to those for whose protection they are appointed. We may rely upon it that the municipal authorities at Memphis would take good care that their police did not head anti-negro mobs, if negro opinion were of the slightest importance at election time. And officers of the law, whether State or Federal, will never, in our opinion, in any part of the South feel as they ought to feel, that the colored population are under the law, as long as that population has nothing to do with their appointment. We are here putting forward no new doctrine. There is not a State in the Union which does not recognize it in its constitution. In none of them is a right of action considered sufficient for a man's security; in none of them is any white citizen asked to rely on the conscientiousness of the governor, or of the mayor, or of the sheriff for protection against fraud or violence. Each man is in all of them armed with the right to help to turn the governor, or sheriff, or mayor, out of office if he does not do his duty. It may be said that resident aliens and women do not possess this right, and yet enjoy reasonable security. But if the population hated aliens as in China or Japan, or as the negroes are hated at the South, they would not enjoy reasonable security without the protection of their own governments, and it is happily still the custom for white men to consider to some extent, at least, the griefs and wrongs of white women as their own.

In a country in which officers are not chosen by the popular vote the idea of responsibility to the public is, of course, weak. Each official thinks of what his superior will say rather than of what the community will say, and the exclusion of any particular class from the franchise there of course makes little, if any, difference, in official eyes, between its claims to protection and those of voters. But our officials are all accustomed by long usage to consider themselves the servants of the voting population, and to look to it for reward and punishment, and the exclusion of a man from its ranks, therefore, inevitably weakens the official respect for his rights.

What has happened at Memphis is but a fair sample of scenes which we may often expect to witness at the South as soon as the Federal troops cease to do police duty. In our opinion nobody will suffer so little from these outrages as the negroes themselves. The killing of a few men or the sacking of a few houses is, after all, comparatively a small matter; but the spectacle of the officers of the law either looking quietly on at such outrages, or aiding and abetting in them, is a great matter. It was the utter loss of all respect for individual rights which

pro-slavery mobs were allowed to work at the South before the rebellion which made the rebellion possible, and there is no part of the Union which is not concerned now in having every man everywhere armed with every means of protecting himself with which legislation can supply him.

OUR SYSTEM OF LEGISLATION.

The Legislature of this State, at its last session, hastily passed an act imposing a tax of one-half to one per cent. upon the gross amount of all brokers and auctioneers' sales of foreign merchandise. Nobody among the classes affected by this enactment heard or suspected of the pendency of any such measure until it had passed into a law, and the Legislature had adjourned. There is not the least reason to doubt that the Legislature passed the bill, and the governor signed it, without at all comprehending its effect. There is a very general and very absurd prejudice against brokers, which is fostered by the discreditable attacks of the press upon "middlemen" and "speculators," and when a draft of this bill was sent up to Albany, as it undoubtedly was by some outsider, the honorable member to whom it was entrusted congratulated himself, we dare say, upon the happy thought of making these obnoxious classes pay handsomely towards the expenses of the State. Such a trifle as three-quarters of one per cent. would surely not be felt by these men, rolling in wealth, as brokers are universally supposed to be. Probably the only doubt that troubled the minds of the majority was, whether they were justified in making the tax so small.

Yet the fact is, that no broker receives more than one per cent. on his sales, while the heaviest business is done for one-half, and a very large business at one-quarter of one per cent. This law, therefore, is equivalent to an income tax of from fifty to three hundred per cent. on the *gross receipts* of brokers in foreign merchandise. This is not taxation—it is confiscation.

Only one thing was left for the Legislature to do, in order that it might reach the climax of absurdity, and that thing was done, if we may rely upon the version of the law which we have seen. The bill did not state, it is said, the object to which the tax is to be applied, and is, therefore, unconstitutional. The Legislature has thus obtained for itself all the discredit of passing an odious measure without really succeeding in raising a penny of income for the State.

We leave to other journals the office of denouncing the members of the Legislature for their individual action, and of insinuating that their motives were corrupt. We do not ourselves place the least faith in such charges. There is no reason to believe that a single member of the Legislature fully comprehended the nature and consequences of the bill. If the minority had done so, they would surely have notified some of the New York brokers of its character. It is almost impossible to conceive of any corrupt motive for the passage of such a measure, applying, as it does, to all dealers of a certain class. The idea, broached in a certain paper which kept two correspondents at Albany last winter, neither of whom had brains enough to expose this bill before its passage, that Boston or Philadelphia merchants devised it as a means for ruining the trade of this city, is too ridiculous to need comment. Men of business do not go into such long-headed schemes of villainy in the vague hope of picking up a few grains of prosperity out of their neighbors' ruin.

The obvious fact is, that this gigantic blunder, involving a tax of millions of dollars, is the fruit of ignorance and haste. The moral to be drawn from it is, that our system of legislation needs reform, so as to secure to it those elements of accuracy, forethought, and deliberation which it now lacks altogether. And the first requisite to such a reform appears to us to be the establishment of a permanent council of legislation, as suggested by John Stuart Mill and others.

This council should, of course, have no legislative powers. It should not have the right of originating or rejecting laws. But every project of a law should be referred to it to be put into proper shape. It should report every measure back to the legislature, reduced to simple and grammatical language, conformed to a uniform standard of legislative style. It should suggest to the legislature the superfluity of clauses which reiterate old law, and the objectionableness of clauses which contravene natural justice; but should nevertheless report them back for the final action of the legislature. It should prepare and publish daily, through the session, an abstract of the measures introduced. The legislature should not be allowed to pass any measure without first submitting it to this council, although it should have power to require a report by a certain day.

This council being permanent, the legislature might, and doubtless often would, refer to it bills of great length, to be reported upon at a subsequent session. Such large undertakings as the Political, Civil, and Penal Code, for example, will always be too much for a single session of the legislature, so long as the members feel bound to examine every line with their own eyes, and to judge of each with their own minds. But after such bills had been thoroughly examined and revised by a council, such as we have described, no sensible legislator would hesitate, having made up his mind upon the general principles involved, to vote in reliance upon the judgment of the council in respect to matters of detail.

The council might, perhaps, be allowed to go further, and to point out, through the governor or by direct report, such statutes as had become obsolete or incongruous with the existing state of affairs, for repeal by the legislature. Such suggestions are of a different nature from projects of new affirmative action, which we should not think it expedient for the council as such to propose, lest the jealousy of the legislature should be excited, and the usefulness of the council be marred in its primary work as a revising body.

There seems to be little doubt that a constitutional convention will be held in this State in 1867. We broach this subject thus early for the purpose of giving time for discussion, and of impressing our convictions upon the public mind at a time when its sense of wrong may awaken in it some interest in those abstract questions which are so unpalatable to business men in general, though of tremendous importance in their practical results.

BETROTHED ANEW.

The sunlight fills the trembling air
And balmy days their guerdons bring;
The Earth again is young and fair,
And amorous with musky Spring.

The golden nurslings of the May
In splendor strew the spangled green,
And hues of tender beauty play,
Entangled where the willows lean.

Mark how the rippled currents flow:
What lustres on the meadows lie!
And hark, the songsters come and go,
And trill between the earth and sky.

Who told us that the years had fled
Or borne afar our blissful youth?
Such joys are all about us spread;
We know the whisper was not truth.

The birds, that break from grass and grove,
Sing every carol that they sung
When first our veins were rich with love,
And May her mantle round us flung.

O fresh-lit dawn! immortal life!
O Earth's betrothal, sweet and true,
With whose delights our souls are rife
And aye their vernal vows renew!

Then, darling, walk with me this morn:
Let your brown tresses drink its sheen;
These violets, within them worn,
Of floral fays shall make you queen.

What though there comes a time of pain
When autumn winds forebode decay;
The days of love are born again,
That fabled time is far away!

And never seemed the land so fair
As now, nor birds such notes to sing,
Since first within your shining hair
I wove the blossoms of the Spring.

Edmund C. Stedman.

TOWN AND COUNTRY ABROAD AND AT HOME.

THAT the Liberal party in France is strongest in the great centres of population was manifested the other day by the electoral vote of the first district of the Lower Rhine, which returned M. de Bussierre to the Corps Législatif over M. Laboulaye. In the city of Strasburg the defeated candidate received a clear majority of two-thirds of the suffrages, while in the rural localities he was unable to make even a respectable opposition. Thus, in the canton of Geispolsheim, he polled but 441 out of 4,493 votes, and nowhere else but in the suburbs more than one vote in five. The journals which had espoused the losing side accounted without difficulty for their disappointment. In the country, they said, political education was less advanced; material interests were dominant; secondary considerations, like the origin of M. Laboulaye, who did not spring from Alsace, had greater weight; and, more than all, the landed proprietors and the administration could more easily control the action of the inhabitants. And what is true in this respect of the Bas-Rhin is true also of the other departments of France, although the elections from Lille to the Pyrenees exhibit a significant increase of anti-Cæsarism. And as in France, so in Europe, not excluding England, where reform is native to the large manufacturing towns, whether its object be a repeal of the corn laws or an extension of the franchise. On the Continent it is the cities which inaugurate revolution. If Berlin were Prussia, the state would not endure for a day a prime minister who overrides the constitution and a king who sanctions his lawlessness. In Italy, Florence and Turin, not Barletta, reflect public sentiment concerning the Roman question.

We ought not to be surprised that Europeans, in criticising the affairs of this country, should transfer to us the situation in which they find themselves. However widely they may err in their geographical notions, they have a general comprehension of the rank of our chief cities, and not unnaturally, perhaps inevitably, regard them as the oracles of the nation. We who live very close to that august body, the Board of Aldermen of New York, have rather a contemptuous appreciation of its character and utterances; yet when it was telegraphed abroad that the Board had approved the President's veto of the Freedmen's Bureau bill, we cannot doubt that a good many minds were deluded as to the popular leaning in the controversy to which that veto gave rise. And, still more recently, when news came that the Senate had passed again and finally the civil rights bill, in spite of the Executive, it was added as a sort of offset, that "a great popular meeting held in Washington resolved to sustain the policy of the President." In these two instances the commercial and political capitals of the United States obtained a deference to which they were by no means entitled.

Nevertheless, here as on the Continent, the real national life is in the cities. The highest activity of the people is displayed in them, and away from them is to be out of the world. They foster the best modes of education, the only learned societies, the greatest variety of amusements; the colleges pay tribute to them; their press strikes the key-note of all public discussions, and more than all else moulds public opinion. They carry to perfection the mutual contact of mind with mind, and stimulate competition to the utmost. Their opportunities attract the talents of every quarter; their necessities spur invention to its loftiest achievements, and drain the resources of a wide and ever-widening area. The growth of the largest of them proves that our civilization is not exempt from the Old World tendency to crowd together in metropolises—a tendency which we have scarcely begun to recognize, and which gives rise to such problems as model houses, underground railways, new sewerages, new piers, new parks, etc., etc. To be sure, the country has not yet sent up a cry like that which agricultural France makes heard in Paris, saying that the cities are sucking the rich pulp of the farming districts, which every year grow more barren and unattractive. It points to the superior speculative inducements of the cities, whose extravagant "improvements," involving municipal loans and lotteries, impoverish the country by withdrawing its capital. Labor follows in the wake of capital. In the ten years ending 1861, three million peasants were transformed into citizens; in fifteen years the movement affected 27 per cent. of the population and enhanced prices 39 per cent. Conscription for the annual contingent of 100,000 men to supply the army converted a large number of laborers into idlers, and created in them a distaste for rural life. On the other hand, the natural increase has not sufficed for these displacements, which are not much aggravated by emigration to foreign parts—the ten or fifteen thousand emigrants per annum being largely balanced by the accession of strangers. With the exception of a standing army, it is evident that the relation of the country to the cities does not differ greatly here from that existing in France, and that the resemblance may, hereafter, be much more complete than it is now. During the war, in fact, we endured both a patriotic and an enforced draft on the ranks of our cultivators, so that no unfavorable condition of the parallel is wanting. But we had then, and have constantly, such a tide of immigration that our vacancies, ordinary and extraordinary, are filled and more; and, as was especially conspicuous during the past five years, our agricultural machinery is equal to the most trying depletion of hands from our fields and prairies.

How, then, is it that the liberal forces of the United States find not, of course, their leaders, but their main support, in the country? that revolutions are brought about in spite of the cities, by steadfast appeals to the public conscience that dwells outside of them? that the cities alone call in doubt the practicability of a republican form of government, and require to be ruled and restrained from without, now by a metropolitan police, now by park commissioners, now by a board of health? How did it happen that before the war the cities were almost unanimously on the side of the most evil power on the continent? We say before the war, for the statement would be untrue since that terrible dispensation. Yet, though the majority has either been diminished or become the minority, the relative distribution of the once dominant party probably remains about the same; so that a recent French tourist in America, writing of the state of feeling consequent upon the veto of the Bureau bill, wisely distrusted the noisy manifestations of the cities, and remarked: "It was not yet known what the country people thought, attached, as they had long been [*de longue date*] to the republican polity, and generally faithful to the radicals."

The conservatism of our cities, as contrasted with the liberalism of those of despotic Europe, is to be accounted for, at bottom, by the difference in the prevailing forms of government on the one part and on the other. The paradox is one not likely to please the enemies of democracy any more than its friends; but while Prévost-Paradol complains that the vote of Strasburg is swamped in the vote of the rural cantons, and calls for a change in the mode of representation, it is the standing peril of New York State that her chief port may swamp her country towns at the polls. In other words, universal suffrage, tempered by absolutism, makes the country formidable; unmixed universal suffrage the cities. The explanation is not difficult. So long as our great national abuse clothed itself decently in republican forms, deferring to the decisions of the ballot-box, ever appealing to the letter of the Constitution, assuming the air of a victim whose rights were outraged at the moment when it was planning fresh assaults upon the liberties of the nation; so long as it was content with this rôle, it counted its adherents in proportion to the offices at its command. In the absence of palpable tyranny, it was natural that men should incline to the party which was uppermost, and which promised them political preferment; and it happened that the cities contained the most ambitious office-seekers and the best material for demagogues. Not that one found greater bigotry, or even greater ignorance, in the city than in the country—in degree. Away from the lines of travel, in places which the mail reaches infrequently, in districts too sparsely settled for good or regular schooling, exists all over the North a nearly hopeless class of illiterate, unreasoning, unconvertible "sovereigns," whose vote must ever be for retrogression or (what is the same thing) the *status quo*. But it was the peculiar lot of the cities, especially on the seaboard, to be the sieves of foreign immigration. In them the paupers, the infirm, and those whose aims and intelligence were as feeble as their means, lodged by the mere force of gravity, and could get no farther. The thrifty—one might say, considering the astounding aggregate of small savings brought to our shores by these people, the well-to-do—and those whose knowledge of a craft or of agriculture rendered them independent as to a choice of residence, moved on, sooner or later, to reinforce the industry and virtue of the country—to redeem Missouri or Texas to freedom. The dregs that remained, from time to time were sifted into the stream of our politics, till its native color was utterly lost; and the monarchist, looking with delight at the turbid overflow, exclaimed: "Behold the failure of democracy!"

Trade, too, has played here as selfish a part as it is wont everywhere. Besides the temptation to support the party of slavery for the salaries it could dispense, the system itself was considered inseparable from our commercial prosperity—a grave economical delusion, but none the less popular till the crash came. This secured the vote of Wall Street for principles which wool-growing, agricultural Vermont repudiated once and always. Cotton-spinning Lowell and General Butler have undergone conversion together. Before the rebellion both saw eye to eye, and in their sight slavery had rights and the spirit of the age had none. To that spirit, we believe, the cities need no longer be united in antagonism. Free hereafter to neutralize by every educational appliance the foreign admixture they are long doomed to experience, they may make themselves illustrious as the laboratories of mankind—the best and speediest elevators of the most degraded of our race.

SOLOMON ANDREWS'S FLYING SHIP.

WHOEVER walks down Houston street nowadays is compelled to notice on the corner of Greene Street a rough board fence of remarkable height, and so closely made as to be proof against the eyes of the most curious. If nothing else calls his attention to it, the group of vagabond boys will be enough, as they hang about the entrance and stare at a singular engraving; or perhaps, no policeman being present, furtively fling a stone, or a sharp-edged oyster shell, over the top of the wall. Within the mysterious enclosure is the flying vessel—the ship which can sail a hundred and fifty miles an hour, which easily sails dead against the wind, which discards steam and coal and engines, and for a motive-power relies on the attraction of gravitation, which is to supersede railway trains and steamboats as a means of travelling by sea and land, which can cross the ocean in less than three days; which, if you build it of metal, and that can be done without the smallest trouble, will become available not only for the conveyance of passengers, but also for the transportation of the heaviest and bulkiest merchandise. It is the aerial ship, the aereon "General Schenck," which is to do all this, which is to more than realize Dr. Darwin's predictions, which is to prove that Tennyson's airy navies grappling in the central blue are not only a possibility, but a probability, and may, at any time when governments shall choose, become a fact. Already, in New York, a company is in existence, with president and directors, and subscribed capital, and an office in Walker Street, which intends at once to fix upon routes of aerial navigation between our great cities, and construct aerial vessels for conveying passengers and freight, and which, as we have seen, has already built one ship that is now floating at anchor in Houston Street. Her, within ten days, shall we not all see as she comes sailing down town at no great distance above our heads, tacking and filling, ascending and descending, going with the wind and against it, visiting any part of the city as the helmsman may direct, and, at the end of the voyage, coming into harbor on the exact spot from which she set out?

The payment of a dollar admits you to a close inspection of this wonder. Going in from the level of the street, one finds before him the site of some building that has been utterly destroyed by fire. The rubbish has been mostly cleared away, and he descends by a flight of many steps to what was once the cellar floor. The neighbors of the burnt building still remain; so the visitor, when he gets to the bottom of the steps, is at the bottom of a great square pit, the sides of which are either lofty brick walls, or, if the walls are low at any place, the wooden fence is seen surmounting them. There is sand under foot and a strong smell of gas around, and high above, balanced in the air, the ship itself, a great buff-colored cloud, with a network of cords around it, strains at the ropes that hold it down, and casts a shadow over the sand.

She is a balloon, not round like a ball but elongated, and at each end running to a sharp point. As the ship is now lying, these beaks, her prow and stern, point toward the horizon, and it is not intended that they shall ever point up and down toward the zenith and the nadir. From end to end her length is eighty-six feet, and her diameter from side to side at the point of greatest width is forty-two feet. In shape she would look much like an Indian's bark canoe, supposing the top of the canoe to be closed as the bottom is, if it were not for a leather strap which, passing from the bow, goes underneath the vessel to the stern and then is carried along the top to the bow again. As the balloon swells against this band, there is created a longitudinal depression extending the whole length of the vessel, and like the cavity made when two cylinders are laid side by side, and this depression can be created at the captain's will. Its capacity is 66,000 cubic feet, and the material of which it is made is very heavy pongee silk. As you look up, a portrait of General Scott, in colors once gaudy but now faded, stares down from the forward part of the balloon, and on the after part there is a General McClellan, for the inventor of the flying ship, in building it, has used the material of two old army balloons, and has adapted it to its present use with characteristic ingenuity. The lower half, say, of each balloon was left whole, the upper part from zenith to equator was cut as an orange peel is cut, then, by fitting these saw-toothed ends into each other, a balloon was obtained new in shape and cheap in cost. Underneath the balloon is a narrow, wicker-work car, twelve feet long, secured by many ropes.

"Characteristic ingenuity" we said, and these are words that may well enough be applied to the man who invented the famous Hobbs lock; who invented the lock which is used in the United States mail service; who, at the request of his oyster-selling townsmen, that they might be relieved from the yoke of the Connecticut keg-makers, invented machinery by which a Jerseyman may make his own oyster-kegs, and at the rate of a hundred a day; who has invented very many other things beside, so that even the pipe which he held in his mouth while he talked with us about the air-ship was constructed on a principle entirely new.

It is upon the shape of the vessel, he explained to us, that everything depends. Fill a round balloon with gas and it ascends, don't it? Goes up vertically. Throw out ballast, it rises higher; let gas escape, it sinks; but it has no forward motion. You 've seen it *drift*, you mean; go hither and thither with the currents. It has no motion of its own except the vertical; no momentum, no motion relatively to the medium in which it floats. But now if you fill with gas a long, broad-backed, sharp-pointed balloon, a balloon so shaped that vertical motion will be very hard for it, will be greatly resisted, what will happen then? How will such a balloon go up? It will ascend, in the direction of the line of least resistance. That stands to reason; its the only way it can go. It will go up just as you 've seen a half-sheet of paper fall; you 've seen it a thousand times; it falls in a slanting direction; it does not drop perpendicularly to the ground, but follows the line of least resistance for a body of that shape. This air-ship is so shaped that when it 's started at an angle of so many degrees with the plane of the horizon to rise into the air, and the ballast is so placed as to keep her bow at the proper angle, she must necessarily rise not vertically but in a slanting direction. She keeps on rising, going forward, you see, by virtue of the slant, and goes up perhaps two miles. In going that high, she has gained so many miles horizontally—perhaps more, perhaps less, according to the wind. The wind will be sometimes with the ship, sometimes against it, and in the average there is neither gain nor loss by it. Having reached a height of two miles, say, the balloon's bow is pointed downward. That is very easily done by sliding a certain portion of ballast to a certain distance from the centre of the car, so as to give the axis of the balloon the proper inclination. Then gas is allowed to escape, and the descent begins. It will be just like the ascent, the line of least resistance will be followed, and in going down so many miles—two, for instance—so many miles of forward movement will be made. Having approached near enough to the ground, another ascent will be made, and then another descent, and so on, till by a succession of tacks, as the sailors say—only in aerial navigation the tacks will be up and down instead of being from side to side—the end of the journey will be reached.

Let the wind blow as hard as it likes; imagine, if you please, that it blows hard enough to carry a globular balloon backward, or sideways, or anyway, at the rate of fifty miles an hour, in the case of a ship balloon nothing would be easier than to guide it by the rudder, and give it an ascending motion which would carry it forward in an hour sixty miles of horizontal distance, and thus you beat the wind ten miles.

We were assured that almost any conceivable speed of upward or downward motion could be imparted to the ship, and that the utmost effect of a storm of wind would be to retard her motion and not to prevent it wholly. A tornado could hardly do that; and in general the action of wind would be so little troublesome or dangerous that it might be disregarded. It would only be necessary in boisterous voyages to expend more ballast and more gas in tacking more frequently and keeping up a greater rate of speed.

Steering? There would be no trouble about that. A drifting balloon could not be steered, but once get momentum and steering follows as a matter of course. What did Professor Henry say in his report to Stanton about the flying ship that was offered to the Government in 1864? He said: "Dr. Andrews has also fully illustrated the fact to the commission that his aerial vessel while passing through the air can be steered. This fact, however, might have been inferred as a corollary from the fact of the transmission, since the direction of a body relative to the medium through which it is moving must evidently be changed if the resistance on one side is made greater or less than that on the other."

There would be no difficulty, either, in making the passengers comfortable. It would be but a very little while before the passenger by aereon would have a sleeping berth or a state-room more luxurious, a better opportunity for getting his meals, and be in all respects better cared for, than the passenger by rail or by steamboat. No mode of travelling would be able to compare with aerial navigation in point of speed, and by and by it must be incomparably cheaper than any other method of transportation. There would be no roads to build, no tracks to lay, no lands to buy, nothing to pay for but the balloon itself and the gas to fill it. In the presence of this ardent benefactor of the race, we none of us suggested what nevertheless of course occurred to us, that in cases of accident the Aerial Navigation Company will have no bills to pay—no hush money for trifling injuries to arms and legs. All accidents will be fatal. It is true that passengers by aereon may have human relatives and ties to bind them to earth. But even in that case what surviving friends can hope success in suing these gigantic corporations? The speaker went on: the cost of the necessary gas was much greater at present than it would be hereafter. Undoubtedly a balloon could be made of copper (copper can be made nearly as thin

as gold leaf), and then the greater part of the original charge of gas would last for an indefinite period, as there would be no leakage whatever, and no gas would be lost except the quantity that might be allowed to escape in the descents. Of course it would not be possible to keep going any longer than gas and ballast hold out; but no more could a locomotive keep going any longer than fuel and water hold out. The ship would be able to stop regularly and lay in a supply of gas and sand. The cheapness of the motive power would be an immense advantage. Nothing could be cheaper than gravitation! When the model was on exhibition in Washington an army officer walked into the room and enquired, What's the motor, sir? Gravitation, sir. He turned round and walked out without saying one word. But simple and plain as the invention seemed, no invention that had ever been made would appear greater in the results of its practical application than this of the flying ship. It would revolutionize all travel and all transportation; its effects would be felt in every field of activity; indeed it was the greatest invention of the century, if not the greatest that had ever been made in the whole history of the race.

This account of the new conveyance is pretty nearly the same that the inventor will doubtless give gladly to any visitor of small knowledge in aerostation. For our own part, being in that category, we may confess that we almost half believed, and we fully hoped, that the coming trial-trip may be successful, and that this marvel may speedily go into that class of scientific miracles which daily repetition makes commonplace. The list is a long one of those romantic wonders to which, after science has killed them, science gives again a sort of galvanized life; and what finer revival of the prince's carpet could be asked than that a piece of pongee silk should carry us to Europe through the upper air?

THE POPULAR INDULGENCE OF MORAL CENSORSHIP.

Let a man set up for a judge of dress and equipage, of dinners and domestic architecture; let him put himself forward at all conspicuously as an *arbiter elegantium* and an authority in upper-tendom, and see what a swarm of hornets he will raise about his ears! Him the daily papers, him the weekly ditto, him the illustrated monthlies, will abuse. Let him take a higher flight and attempt to communicate to the public his foreign experience in matters of art, or guide it in the appreciation of our home performances; his unpopularity will be more limited, but none the less intense. Or suppose that his tastes are literary instead of artistic, and that he exerts himself to aid in the formation of a higher standard of literary criticism; his attempts to expose ignorance and correct bad taste will be attributed to envy, self-conceit—any motive but a good one. The political student may be inclined to attribute all this to the social workings of democracy. The people, it may be said, being all equal in theory, and to a great extent equal in practice, cannot brook dictation or the appearance of dictation on any subject from one of themselves. Indeed, it has been often charged against democracy by its enemies, and sometimes admitted by its friends, that on this very account it is unfavorable to the thorough pursuit and development of any high specialty.

But if we turn our eyes to another quarter we behold an equally marked indulgence for the self-constituted lecturer. Any person that can put together passably grammatical sentences in a tolerably flowing style, may set up for a moral reformer, or at least a moral essayist. It seems to be at once the easiest and the most popular form of declamation and platitude. It seems to be quite within the province and ability of any respectable American man or woman to advise his or her fellows on the greater and the lesser ethics. Monkeys in a menagerie have been observed at feeding-time to steal one another's provender, instead of being content each with his own, causing thereby no small waste of nutriment; and, in like manner, those of our population who take an interest in ethical questions appear bent on correcting their neighbors, possibly with a corresponding waste of morals.

Now, the first thing that strikes us here is a startling inconsistency. If there is anything that requires special preparation and study, if there is anything for which we won't say an average man or woman, but a man or woman considerably above the average, taken at random, is not fit, it is lecturing on ethics. Any person, of fair natural presence and a disposition not essentially vulgar, may qualify himself for a small Pelham or amateur master of the ceremonies by a few years' residence abroad, limiting his "abroad" to a very few places. Art criticism is capable of being made something very magnificent, but the ordinary run of it does not demand any very intense course of study. If the critic has as much aptitude for art as would have sufficed to make him a respectable third or fourth-rate artist, and as much leisure as will enable him to read the standard manuals and turn himself loose for a season in some good foreign gallery, he may acquit himself tolerably in his vocation. Literary criticism demands something more. To make a reviewer worth the name, one should have a good liberal education and be somewhat of a scholar. Yet the warmest friends of literary criticism (and we profess to be among them) could not fairly ask more for it than that it should be put on a level with ethical. For, of a truth, ethical criticism, to possess any value, demands a very thorough and elaborate preparation on the critic's part. He need not be a theologian—perhaps, on some accounts, he is better for not being one—but he should have some (and more than a little) *historical* knowledge of theology. His direct subject he should have studied historically, geographically, and metaphysically. Among other little trifles of which he should be master is political economy; for there are some real and many apparent conflicts between the principles of the two sciences, and it is a nice matter to reconcile them or decide which must yield to the other. Finally, he should have a fair share of social knowledge and practical experience among various sorts of people, else will he be as likely to blunder as an engineer or mechanician who has only studied pure mathematics. A professor of *casuistry*—as some of the old European universities still call moral philosophy—ought to be one of the first men in the country; and the amateur dabbler in the business ought first to make sure that he possesses *some* extra qualifications for the task. Take, for instance, the extent and limits of the connection between public and private morality. Say how far there is danger to individual morals from the political corruption of this State; or the success of certain scandalous journals, a fact so difficult to account for by natural causes that we know perfectly sane and well-educated men who seriously attribute it to direct diabolical agency. These are problems calculated to tax to their utmost the learning and intellect of the student and philosopher; and it is but fair to add that our volunteer casuists generally fight shy of them. But take the pet theme of extravagance, especially female extravagance; how much rubbish is printed about it every day!

We suspect that a good deal of our lay preaching is due to emulation of the professional performances in the same field. If a minister may lecture his congregation on their duties at least once a Sunday, why may not some of the congregation try their hand on week-days? Because there are many salient differences in the two cases. First, the majority of sermons are not printed. Then the day is properly devoted to the theme. However commonplace it may seem to tell the people week after week that *virtus est bona res*, yet while there are so many ready to insinuate, if not openly to assert, that *vitium est melior res*, it is well that poor Virtue should have a day to herself. Above all, the mere position of the preacher as pastor of his flock involves the assumption that he is qualified to give them advice on ethical matters. Though his original specialty be that of theologian, yet in all well-regulated communities he has a co-ordinate (for we will not allow it to be a subordinate) specialty, that of moralist. Therefore, while a goodly part of our pulpit discourses in most denominations will always be doctrinal, it is but right that about an equal number should be moral. It is part of the preacher's business that they should be.

Do we, then, conclude that none but preachers and professors should open their mouths and their pens on moral subjects? By no means; these questions should be largely treated of in our press, but sceptically rather than didactically—in other words, by discussion rather than by homily. Any newspaper article on a moral theme, if it is not published merely as "padding," or for the less innocent purpose of making a sensation, may do good, inasmuch as it provokes argument from correspondents and contemporaries, and causes the subject to be presented in various lights. Our objection is to those essayists and lecturers who, on the strength of a little superficial smartness and plausibility of style, affect to speak *ex cathedra* on all matters coming under the broad head of morals, from the minor courtesies of life up to transcendental ethics.

Fine Arts.

THE FORTY-FIRST EXHIBITION OF THE NATIONAL ACADEMY OF DESIGN.

[SECOND NOTICE.]

Mr. G. C. Lambdin has a picture in the North Gallery, No. 196, which is very pleasant to see. It is not only the best picture by him that we have seen, it is free from faults which have disfigured others, and is good in some ways in which his work has often been deficient. It is very simple in subject: a little girl who has skated all the way home from school, and has fallen asleep in an arm-chair; she is all dressed in her red and black out-of-door dress, her skates hang on the arm of the chair, and her strapped books and one of her red gloves have fallen at her feet. And this little picture

very unpretending, undoubtedly a portrait, expressing no sentiment but the simplest, having sufficient technical merit to pass with credit the competitive examination of this exhibition, is a picture of a certain importance. It is a success in that it is in all respects what it was intended to be. This is much less completely true of the two other pictures by Mr. Lambdin, No. 388, "Compensation," and No. 415, "At the Front." These pictures, and especially the former, are of a sort which are nothing if not expressional. But Mr. Lambdin has chosen quiet attitude and absolutely no gesture that can speak, and he has as yet shown no power to paint an expressive face, a face full of emotion. The sentiment of "Compensation" is healthy and true enough; the same young officer who, two years ago, in a companion picture was having his sword consecrated with kisses, is at home, recovering from wounds; he sits in his invalid's chair by the open window, and looks lovingly at the young lady who kissed the sword and is now standing by the window side. It is a great deal better work than the former one. But to save such a picture from the limbo of the commonplace, there is needed either great power of conception of the scene and the characters, or else such singular technical excellence as makes Meissonier, for instance, an artist of deserved fame. The scene Mr. Lambdin has wished to paint is one wholly worth representing; but the question about the scene as represented will be whether the story is forcibly, truly, exhaustively told, as well as whether it is worth telling at all. There are myriads of modern love poems very poor, although the people who wrote them had truly loved, and were in earnest when the songs were written. There is one Browning found to write fifty, all good; one Béranger to write hundreds, all good. You may be a much better man than Béranger, and love much more purely and lastingly, and not be able to write quite so well about love. Nor is it any disgrace not to have the golden gift, nor any trouble if one is not trying too hard to get it, nor deluding himself into the belief that he has got it. All of which has this application: that Mr. Lambdin, with all his evident rightness of feeling and gentleness of nature, has hitherto wholly failed to paint truly poetical pictures, until he tried a very simple order of poetry in his story about the tired little girl, and succeeded. It is his success in this that seems to promise that he will succeed in other and higher themes. But his execution must be greatly improved, and the smeary look of his pictures once for all changed. Nothing important is gained by his present system of laying color, and much is lost. In this, indeed, as in other respects, the first-named picture is better than others. The little girl's head is painted with a certain decision not often seen in Mr. Lambdin's work; but the carved chair and the screen, which Willems would have delighted to paint accurately and minutely, Mr. Lambdin does not seem to like well enough to let us see them plainly.

Mr. W. J. Hennessy's picture, "Drifting," No. 375, affords much material for thought, and will leave his critics speculating and wondering over questions which will not be answered until next fall's or next spring's pictures come to answer them. What has he had in view in his recent work? What good thing is he seeking? We think it is doing him only justice to assume that he has some very definite end in view. This picture is unusually large for him, is a beautiful composition, very delicate in its lines, very refined in much of the drawing; it is painted almost entirely in shadowless color, all concern with the monster chiaro-scuro being abandoned; yes, Mr. Hennessy is in pursuit of something. Whether that something is attainment of real strength of color and design—perhaps in out of the way developments—or whether it is only imitation of certain tendencies of some modern European artists we might name, time only will show. Meantime "Drifting" is a very pleasant canvas to study, though hardly a finished picture, we think. No. 305, "In Memoriam," is of much less value. The larger picture was enough to have sent this year; a sufficient indication of the good things which it tells us are to come.

Mr. S. J. Guy is one of our very few figure painters of any merit, and at every exhibition we look for his pictures with hope—hope that they will give signs of steady progress and of real excellence at last. This is not always gratified. It seems, indeed, that the painters who are ahead of him now are progressing faster than he. But, as he sends only one little picture this year, and never more than two or three, all very small, it may well be that he does work of which the world knows nothing; of which, if something should be better than what he exhibits, it would not be surprising. No. 243, "The Alphabet," is not one of those pictures which are best worth study.

We do not remember pictures by Mr. M. Lander before, but his water-color drawing, "Interruption," No. 102, shows a certain rapid skill and a very unusual dexterity in the use of water-color. The subject is nothing, but it is probable that Mr. Lander can draw, and perhaps there will be more of his work to be seen hereafter.

There are, despite of the hanging committee, some representatives of that class of figure pictures which a beholder may laugh at or mourn over, as he thinks them the more amusing or discouraging. Mr. Stearns, for instance is an academician, an officer of the Academy, as the catalogue sets forth. His picture called "The Studio," No. 261, indicates no advance beyond the stage of pupilage. There is worse work than this; there are several degrees or stages below it; but this remains wholly without value. It is accurately to be described as beginners' work. His life-size portrait with peach-tree, last year, bad as it was, was better than this. The picture is hung on the line, having fairly beaten the hanging committee, whose victory on the line this year is not complete.

Mr. Fritz Meyer has six works on exhibition; two of these are partially of figure subjects; both are worthy of severer reprobation than critical writing ought to lend itself to. The proper award for such work is simply rejection and forgetfulness, and the latter would be assured by the painter's rapidly growing disgust with his work.

Mr. G. W. Flag has touched bottom in his picture "The Suspicious Note," No. 108. Neither this nor those last before mentioned are proper subjects for criticism, but are beyond its bounds, needing, as we have said, rejection and oblivion only.

BOOKS OF THE DAY.

FRANK, FEARLESS,

AND

INDEPENDENT OF PARTY CONTROL.

THE EVENING POST.

NEW YORK.

The EVENING POST, now in its sixty-fifth year, having begun with this nineteenth century, has always maintained a leading position among the metropolitan journals.

The fearless and hearty support which it has always given to the great principles of universal justice and freedom has made it almost the indispensable companion of brave and true men who are more deeply interested in the success of principles and the progress of humanity than in the triumph of party.

During the war the EVENING POST was one of the most earnest and vigorous supporters of the cause of the Union; it held up the hands of our brave soldiers in the field, and encouraged the hearts of our noble men and women at home; every project for pushing on the column had its zealous support; while it no less zealously lashed and rebuked treason in all its forms, whether open and courageous, as at the South, or covert and mean, as at the North.

At the same time, with all its enthusiasm for liberty and union, the EVENING POST did not close its eyes to the dangers of an abuse of power; it was the enemy of all undue exercise of the central authority, of all kinds of political jobbery and corruption; it has insisted upon economy in expenditures, and of the strictest adherence to the Constitution. To these principles the EVENING POST intends to adhere.

But the EVENING POST has always aimed to be more than a political and commercial journal. It desires, besides, to be "a good newspaper." In its columns will be found a complete history of the events of the day, important political or state documents entire, proceedings of legislative bodies, summaries of European intelligence and news from all parts of the world, accurate reports of financial and commercial matters, trustworthy correspondence, and a carefully selected literary miscellany, comprising poetry, reviews of new works, with liberal extracts, gossip, and anecdotes—the whole forming an excellent variety, in which every reader will discover something to his taste.

CHANGE OF TERMS.

We are gratified to announce that the decline in the price of paper enables us to reduce our rates to a very low standard.

We hope to have the co-operation of our friends in extending our circulation, as formerly, and shall be pleased to send specimen copies, posters, and blank lists to persons whose facilities or inclination may prompt them to get up a Club.

EVENING POST—Weekly.

Single copies, one year	$2 00
Five copies	9 00
Ten copies, addressed to names of subscribers	17 50
Twenty copies, addressed to names of subscribers	34 00
Ten copies to one person's address	16 00
Twenty copies to one person's address	30 00

Additions may be made to the club at any time at club rates. An extra copy will be sent for each club of ten.

EVENING POST—Semi-Weekly.

One copy, one year	$4 00
Two copies, one year	7 00
Five copies or over, for each copy	3 00

An extra copy will be sent for each club of ten at these rates.

EVENING POST—Daily.

$12 per annum; or for any period over a month at same rate.

POSTMASTERS or others, acting as Club Agents, who prefer cash discounts, instead of free copies, can learn particulars on application.

CLERGYMEN are supplied with the Daily paper at $10, Semi-Weekly at $3, or Weekly at $1 50 per annum.

REMITTANCES should be made, if possible, by draft or Post-office order, payable in New York.

FINANCIAL REVIEW.

Nation Office, Monday Evening,
May 14, 1866.

The news from Europe to May 3 is the most alarming that we have received for some time. In two days the French funds had fallen 5 per cent., and the panic on the London Stock Exchange was the most severe that had been known since 1857. The Bank of England had advanced the rate to 7 per cent. Cotton had fallen to 14d., and in all the markets there was an eager wish to sell at any prices. Five-twenties were down to 68 to 68½; Erie to 49½ to 50; Illinois Central to 78 to 78½. It is taken for granted that so widespread an alarm must have been caused by private but well authenticated news of the probable intervention of France and Italy in the German dispute, and of the imminence of a general European war.

This country will participate less than heretofore in foreign monetary disturbances to be caused by a European war, for the reason that we are trading on a currency which is not the currency of Europe. A monetary panic in England need not involve a monetary panic here. At the same time we shall not altogether escape the effects of the European troubles. It must be expected that considerable parcels of 5-20 bonds, Erie, and other American securities will come here for sale; that the foreign enquiry for our cotton, breadstuffs, and produce will be checked; and that, in consequence, heavy shipments of gold will be made to the other side. In anticipation of these changes sterling bills have to-day advanced to 109⅝, and gold to 130⅝. Gold would rise still higher but for the apprehension of sales by Government. Mr. McCulloch is in a position to throw fifteen millions on the market in the event of a speculative movement for the rise. A further decline in cotton would seem probable, as even at present prices it cannot be shipped except at a heavy loss. Breadstuffs are not moving at all. Indeed, so disproportionately high is the price here that we have been receiving from France some flour which has paid a very fair profit to the importers.

Money continues very easy. Call loans are 4 to 5 per cent; first-class short paper, 5 to 6. No one seems to anticipate any advance in the rate of interest at present, unless the department should withdraw the deposits from the national banks. The investigation into the Merchants' National Bank, at Washington, reveals scandalous looseness in the administration of the public finances. It would seem that the heaviest deposits of public money were made after the insolvency of the bank was acknowledged.

The stock market continues very dull, but firm. New clique movements have been inaugurated in Pittsburgh, Michigan Southern, and Illinois Central. The last mentioned stock can now be imported at a profit of ten per cent., but, as the road is doing well, there is better reason for the advance than in the case of the former stocks. The Erie earnings for April show a falling off of $385,000 as compared with last year; should the decline in traffic continue, the summer dividend will be out of the question. There is a profit of 5 per cent. on the importation of Erie, and it will probably come here in considerable amounts. This morning, on the foreign news, it fell to 72⅜; it has since recovered 1 per cent. of the decline. Central is dull and steady. Rock Island, which is now selling dividend off, has been as high as 96½ and as low as 94⅜. The stock and debt of the concern will now stand at about $17,000,000, as against $9,000,000 before the purchase of the Mississippi and Missouri road. Whether the earnings will increase in proportion remains to be seen. Among speculators the prevailing theory is that the ease of money is sure, sooner or later, to generate a speculation which will be quite independent of intrinsic values. In Governments, 7.30s are strong and higher.

The following table will show the course of the stock, gold, exchange, and money markets since our last issue:

	May 7.	May 10.	May 14.	Advance.	Decline.
United States Sixes of 1881	109	109⅛	109	....	⅛
5-20 Bonds, old	102	102	101⅞	....	⅛
5-20 Bonds of 1865	102	102	102	....	...
10-40 Bonds	95⅞	95⅞	96	⅛	....
7.30 Notes, second series	101⅛	102⅛	102⅛	⅜	....
New York Central	92⅛	92⅛	92¼	....	¼
Erie Railway	73⅛	73¾	73⅝	....	⅛
Hudson River	110⅛	109¾	109⅝	....	¼
Reading Railroad	107⅛	107⅛	107⅛	⅜	....
Michigan Southern	78	78¾	80	1⅝	....
Cleveland and Pittsburgh	82	82¾	84⅛	1⅛	....

Light Biscuit made in fifteen minutes with T. B. BABBITT'S STAR YEAST POWDERS, 70 Washington Street, N. Y.

Improvements in Piano-fortes.

One of the simplest and most truly valuable improvements yet made in the Piano-forte is that invented and patented by

DECKER BROTHERS, 91 BLEECKER STREET,

in this city. By correcting the only imperfections arising from the use of the full iron-plate, and that, too, by not detracting in the slightest degree from its many positive advantages, the Messrs. DECKER have developed in their instruments a tone at once admirable for its purity, fulness, prolongation, and sweetness, and the high estimation in which their improvement is held is well shown in the rapidly increasing business of their firm.—*Tribune.*

Saleratus.—B. T. BABBITT'S SALERATUS, 70 Washington Street, N. Y. If you want healthy bread, use B. T. Babbitt's best medicinal Saleratus, made from common salt. Bread made with this Saleratus contains, when baked, nothing but common salt, water, and flour. B. T. BABBITT, 64, 65, 66, 67, 68, 69, 70, 72, and 74 Washington Street, N. Y.

HOME FOR INVALIDS,

ESTABLISHED IN 1847,

BY E. E. DENNISTON, M.D.,

At Springdale, Northampton, Mass. Number limited to Forty.

Aware of the principles Dr. Denniston proposes conducting it upon, we are induced to recommend his establishment for the treatment of Chronic Diseases of various kinds. We believe it contains all the advantages of similar establishments, and have confidence in the skill and judgment, experience and prudence, of Dr. D. to direct the application of the various remedial treatment according to the exigencies of the individual cases.

THE BEST SEWING-MACHINES IN THE WORLD.

THE WEED MACHINES,

With all their valuable improvements, entirely overcome all imperfections. They are superior to all others for family and manufacturing purposes, simple in construction, durable in all their parts, and readily understood. They have certainty of stitch on all kinds of fabrics, and are adapted to a wide range of work without change or adjustment, using all kinds of thread. Will hem, fell, bind, gather, braid, tuck, quilt, cord, and, in fact, do all kinds of work required by families or manufacturers. We invite all persons in search of an instrument to execute any kind of sewing now done by machinery to inspect them, and recommend all parties engaging in the sale of sewing-machines to make sure they secure the best by examining the WEED before purchasing. They make the shuttle-stitch, which cannot be excelled for firmness, elasticity, durability, and elegance of finish. They have received the highest premiums in every instance where they have been exhibited in competition with other standard machines. The company being duly licensed, the machines are protected against infringements or litigation.

Reliable agents wanted, to whom we offer great inducements. Every explanation will be cheerfully given to all, whether they wish to purchase or not. Descriptive circulars, together with specimens of their work, will be furnished to all who desire them by mail or otherwise.

FINANCIAL REVIEW 638

Topics of the Day.

WE see no particular fault to find with the President's third veto message, except that he rather gratuitously puts forth by implication the fallacy that the States whose loyalty compelled them to be the Union can now have no right to exercise the powers inherent in the completed Union. It cannot properly be objected to the message, that it is an exercise of the veto power in a case where no fundamental principle is concerned. Aside from the fact that fundamental principles of right are threatened when party expediency is suffered to work injustice to the nation at large, the President would certainly have been derelict if he had allowed for no perceptible good reason the admission of Colorado to all the heavy burdens and all the great privileges of a State, while her population is so insignificant in number and so very doubtfully desirous of discarding the territorial government. The message, with the exception of the last clause, is candid and dignified in tone, and there is hardly a doubt that it will be sustained in Congress.

JEFFERSON DAVIS has been indicted for acts of treason committed in Richmond in June, 1864, and, though the Chief-Justice seems to have hardly got over his hesitation, the trial will in all probability soon take place. As far as Davis himself is concerned, it will probably prove a farce. He is said to have received the news of his indictment with joy, which was probably caused one-third by the prospect of a change in his situation and two-thirds by confidence that he would be acquitted. We have no idea that Mr. Johnson expects or desires him to be punished. That holy horror of treason and traitors which shed a lurid light on the first fortnight of the President's administration died out long ago, and its place has been taken by a mild desire to have the possibility of committing any such crime as treason tested before a court, and to get rid of Davis somehow. There is probably just as little doubt in the public mind now as there was two years ago that Davis did commit treason, but the number of those who care whether he is punished for it or not has probably diminished one-half.

IT will be very strange if we do not eventually get at the truth in the matter of the Memphis riot, concerning which some one who has kept account reckons that seven independent commissions, civil and military, local and national, black and white, have been ordered. Mr. Washburne, who serves on the House Committee of Investigation, was also, if we mistake not, a member of the one which enquired into the Fort Pillow massacre—another beauty-spot on Western Tennessee. The case is not receiving a whit more attention than it deserves. Nothing can be more impressive not only to the guilty parties, but to that large population in the South whose hatred of the negro only lacks an opportunity to be converted into violence, than to see such an extraordinary "fuss" made over "niggers." When the idea is once fairly apprehended that the Government means protection for all classes of its citizens, there will be a very sensible diminution of colored persons killed, colored churches and colored school-houses burned, at the South. There can, in our minds, be no sounder policy for the Government than to treat every such occurrence as of extraordinary importance. Half of them are due to the prevailing Southern impression that they are insignificant.

THE "excentric" head-centre Stephens had his ovation at Jones's Wood on Tuesday. His speech was a review of the origin and progress of Fenianism, and of the circumstances of his call to be its authoritative leader. He had the franknes to acknowledge that he never had received much pecuniary aid from this country, in spite of the two or three visits he had made here and of the fine promises which he had reaped so abundantly on each occasion. He was even sincerely sorry that the stay-at-home Fenians had not trusted to their own resources entirely, and had ever looked to America for anything whatever. But he was of the opinion that if, while he was in prison—"the time of our greatest power in Ireland"—a small force, "or even a few superior officers, with the necessary war material," had been sent to Ireland, it would be an independent country to-day. Except this confident statement there was very little brag on the part of Mr. Stephens, and not much else in his remarks that was noticeable. We have before expressed our hope that Fenianism might really do something for Ireland by weakening the influence of the priesthood; and on this point Mr. Stephens was very explicit. He said that the Fenian oath had been devised "to make the people distinguish between the two-fold character of the priests and clergymen of all classes," and while owing them obedience and devotion in their spiritual character, "in their temporal character simply to look on them as citizens." "Without this training," he added, and we believe him, "you never could have a force in Ireland on which you could rely."

THE cholera makes no progress here, but on the Continent it is awakening from its torpor, and the same class of German emigrants who brought it to us are endangering England. The steamship *Helvetia*, from Liverpool for New York, put back just after leaving Queenstown, on account of the breaking out of the disease on board. The passengers have been put in strict quarantine, and it is reported that German immigration, *via* England, will be prohibited by Government.

IT is an agreeable novelty to see in our city streets commodious drays loaded not as once with heaps of prostrate, agonized calves on their way to slaughter, but with the animals all standing and, as far as may be, enjoying themselves. The change, as every one knows, is due to the Society for the Prevention of Cruelty to Animals, whose very existence guarantees greater humanity in the transportation of stock as

well as in the everyday treatment of the horse. A few wholesome prosecutions answer for an advertisement, and the effect sought after ensues. We wish the society would abolish the first of May in behalf of man and beast alike, though we have noticed that the teamster is never so careful of his team as on moving-day, and that if he can possibly make five loads out of three he is sure to accomplish it.

We get from Richmond more important news than that Davis is to be tried there. One of the old Virginia dreams, that somewhere near the mouth of the James a great city was sure to spring up, at last seems not unlikely to be realized. It is not to be at Norfolk, however, but at Newport News. From that harbor to Cincinnati the distance is shorter by one hundred and ninety-three miles than from Cincinnati to Baltimore, and two hundred miles shorter than from Cincinnati to New York. Travel along this line is not affected by the inclemency of winter. Money has been provided by Northern capitalists, and within three years the Covington and Ohio Railroad is to be built, and the chain of communication completed by short links between Richmond and Lynchburg and Richmond and the coast. A French company has deposited $3,000,000 with the State government as security for the completion of the James River and Kanawha Canal. Thus the new rival of New York is to be connected with the great West by the shortest railway and the best line of water communication; and Virginia, which under the old system literally manured the ground above her iron mines with rich plumbago ore, in order that tobacco might be cultivated by slave labor, under a new system may yet become the greatest of States.

Colorado was named in the list of territories whose acts of organization have just been amended. As the latest step taken by Congress towards universal suffrage, and as a contrast with its previous action in regard to Colorado, a portion of the new bill will be read with interest. The ninth section provides that in none of the nine Territories shall there be denial of the elective franchise to any citizen because of his race or color. Mr. Le Blond, of Ohio, did not believe that Congress had any power to interfere with the rights of suffrage of the citizens in the Territories, but the bill passed by a vote of 79 to 43, many Unionists not being present when the vote was taken.

The general impression in Europe, in the first week of this month, was that war was imminent. The Prussian Government had issued a circular despatch to its foreign representatives, explaining that the negotiations on the question of disarmament had led to no result, on account of Austria's warlike preparations in Venetia, and casting upon that empire the full responsibility for whatever might ensue. Accordingly, Prussia was making great preparations in the districts adjoining Saxony, threatening, as it seemed, an advance into that kingdom; and the immediate mobilization of the whole Prussian army was daily looked for. The Austrian armaments, in Venetia, Bohemia, Moravia, and Western Galicia, were equally pushed forward with great vigor. According to a telegram from Prague, all portable church property, as well as the valuables of the ex-Emperor Ferdinand, had been removed from that city to Vienna. Great excitement prevailed in Venetia; the proclamation of a state of siege in that province was expected. Gen. Benedek was regarded as the future Austrian commander-in-chief. The Italian Government had concluded a new loan of 250,000,000 lire with the National Bank of Italy. The war fever ran high throughout the peninsula. Still, both the Italian and Austrian Governments continued to make public assurances of their determination to abstain from aggressive movements. To this course the French minister, Rouher, declared Italy to be pledged, upon persuasion of the French cabinet. The same statesman summed up, in the Corps Législatif, the intentions of his own Government in the following "three words: a pacific policy; loyal neutrality; complete liberty of action." M. Thiers, in a long speech, attacked this policy as too lenient towards Italy, in which Jules Favre disagreed with him. The Paris Bourse was agitated by a kind of panic. There was some talk of a European congress, as well as of mediations by England and Russia, but without a reassuring effect.

CONGRESS.

Washington, May 16, 1866.

The veto message of the President (number three) rejecting the bill for the admission of Colorado is received with the greatest equanimity by Congress. There is a highly influential minority of the Republicans opposed to any admission of these petty Territories on grounds of principle. And the few thorough-paced partisans who desired the admission of Colorado to make votes in the Senate, are estopped from defending it on that ground by the already overwhelming majority, to say nothing of higher considerations.

The House makes steady progress with the tax bill, and will leave the reconstruction issues to the Senate for a fortnight to come.

The decision of the Senate, after a week's strenuous argument, to leave the quarantine arrangements of the States against the cholera undisturbed, merely authorizing the Secretary of the Treasury to use the national authority to act "in aid of State or municipal regulations," was a surrender of the champions of high Federal powers which was unlooked for.

DIARY.

May 14.—In the Senate, the bill to prevent smuggling was discussed and amended.

In the House, the Judiciary Committee were instructed to report on the expediency of abrogating the laws making the tenure of office dependent on the appointing power. A select committee of three was appointed—yeas, 87; nays, 22—to investigate the late riots at Memphis (Tenn.), and report the facts to the House. Mr Chanler, of N. Y., offered a resolution lauding the President for defending the country by his veto power "against the wicked and revolutionary acts of a few malignant and mischievous men." The House refused to consider the resolution—yeas, 19; nays, 84. Mr. Schenck offered a resolution of censure upon Mr. Chanler for offering a gross insult to the House. Adopted—yeas, 72; nays, 30. The internal tax bill was debated and amended.

May 15.—In the Senate, a bill to authorize an additional assistant secretary of the navy was passed. Also, a bill fixing the time and place for holding the U. S. Circuit Court for the Virginia district, at Richmond, in May and November. The House joint resolution to prevent the introduction of cholera was amended and passed—yeas, 27; nays, 12. A message was received from the President returning, with objections, the bill for the admission of Colorado to the Union. A bill to prevent smuggling was passed.

In the House, the bills of the Joint Committee on Reconstruction, to declare certain persons ineligible to office, and to restore States late in insurrection to full political rights, were postponed two weeks. A bill to amend the organic acts under which the Territories of the U. S. are organized was passed, the House refusing—yeas, 36; nays, 75—to strike out a section prohibiting any denial of the elective franchise on the ground of color. The tax bill was further debated and amended.

THE FREEDMEN.

Freedmen's schools are in successful operation in fifteen large cities of Alabama, and in them more than 10,500 pupils are taught. In some of the white churches colored children are taught under the superintendency of the pastors. At Demopolis the citizens have contributed of their funds to aid in the erection of a school-house for colored people. At Tuskegee the mayor of the city has charge of a large colored Sunday-school.

The Georgia school reports for the month of April give 71 schools, 103 teachers, and 6,991 pupils; showing an increase, since January, of 9 schools, 15 teachers, and 422 pupils. From the 1st to the 30th of April the attendance in Macon increased 314, and in Columbus 307; while in Savannah it ran down from 1,759 in March to 1,369 in April. The schools are in thirty-two different localities—36 of them with 61 teachers and 4,969 pupils being in the cities of Savannah, Augusta, Atlanta, Macon, and Columbus. In nine places, during the month, the freed people paid $498 to the cause of education, $213 of which were paid in support of private schools in Augusta. About twenty-five schools are supported exclusively by the freed people and the others by Northern societies. All are doing well, and many of them are of the highest order, both in progress and discipline.

—The March returns of the health of the freedmen show a slight increase of sickness over the preceding month, but a smaller percentage of deaths. Virginia and the Carolinas are very sickly at present, and small-pox particularly is gaining ground. This disease is noted as being rare in the Gulf States. There were treated in February 318 refugees; in March, 534. The deaths among them are much fewer in proportion to those treated than among the freedmen.

Notes.

LITERARY.

MATTHEW ARNOLD has lately published three papers on "The Study of Celtic Literature" which are among the best things that he has written, being excellent specimens of intelligent and judicial criticism, and containing, in small space, a deal of curious and interesting matter. As regards Celtic literature, he occupies a middle ground, avoiding the mistaken enthusiasm of those who find all the traditions of past ages therein, chief among whom must be reckoned the Rev. Edward Davies, the author of "The Mythology and Rites of the British Druids," and the over-critical scepticism of those who find it little but a mass of imaginative rubbish of a comparatively recent date. Speaking of one department of Celtic literature, that of the Welsh, he states, on the authority of one who is no friend to its high pretensions, that "the Myvyrian manuscripts alone, now deposited in the British Museum, amount to forty-seven volumes of poetry, of various sizes, containing about 4,700 pieces of poetry, in 16,000 pages, besides about 2,000 englynion or epigrammatic stanzas. There are also in the same collection fifty-three volumes of prose, or about 15,300 pages, containing a great many curious documents on various subjects. Besides these, which were purchased of the widow of the celebrated Owen Jones, the editor of the 'Myvyrian Archæology,' there are a vast number of collections of Welsh manuscripts in London and in the libraries of the gentry of the principalities." Mr. Arnold pays a few words of tribute to the memory of Owen Jones, a Denbighshire peasant, who went up to London a young man of nineteen, and worked as a furrier there for forty years, the chief aim of his life being to collect and give publicity to his country's literature—an object which he accomplished at the commencement of the present century by the publication of his "Myvyrian Archæology"—a noble work, with all its imperfections. The stock of Irish literature, printed and unprinted, is, if anything, larger than that of Welsh, and the work of cataloguing and describing it has been admirably performed, Mr. Arnold says, by Mr. Eugene O'Curry, a remarkable man, who died the other day. An idea of its extent may be gathered from his lectures, which were delivered at the Catholic University in Dublin, and in which he states that the great vellum manuscript books belonging to Trinity College, Dublin, and the Royal Irish Academy, have between them matter enough to fill 11,400 closely printed quarto pages; that other vellum manuscripts in the library of Trinity College have matter enough to fill 8,200 pages more; and that the paper manuscripts of Trinity College and the Royal Irish Academy together would fill 30,000 such pages more. Mr. Arnold gives the names of some of these works, as the "Book of the Dun Cow," the "Book of Leinster," the "Book of Ballymote," the "Speckled Book," the "Book of Lecain," the "Yellow Book of Lecain," the "Féliré of Angus the Culdee," and the "Annals of the Four Masters," which last gives "the years of foundations and destructions of churches and castles, the obituaries of remarkable persons, the inaugurations of kings, the battles of chiefs, the contests of clans, the ages of bards, abbots, bishops, etc." O'Curry relates a story of the effect produced on Moore, the poet, who had undertaken to write a history of Ireland (a task for which, as Mr. Arnold justly observes, he was unfit), by the contemplation of an old Irish manuscript. "In the year 1839," says O'Curry, "during one of his last visits to the land of his birth, he, in company with his old and attached friend Dr. Petrie, favored me with an unexpected visit at the Royal Irish Academy. I was at that period employed on the 'Ordnance Survey of Ireland,' and at the time of his visit happened to have before me on my desk the 'Books of Ballymote and Lecain,' the 'Speckled Book,' the 'Annals of the Four Masters,' and many other ancient books, for historical research and reference. I had never before seen Moore, and after a brief introduction and explanation of the nature of my occupation by Dr. Petrie, and seeing the formidable array of so many dark and time-worn volumes by which I was surrounded, he looked a little disconcerted, but after a while picked up courage to open the 'Book of Ballymote' and ask what it was. Dr. Petrie and myself then entered into a short explanation of the history and character of the books then present as well as of ancient Gaedhelic documents in general. Moore listened with great attention, alternately scanning the books and myself, and then asked me, in a serious tone, if I understood them, and how I had learned to do so. Having satisfied him on these points, he turned to Dr. Petrie and said: 'Petrie, these huge tomes could not have been written by fools or for any foolish purpose. I never knew anything about them before, and I had no right to have undertaken the 'History of Ireland.'" And from that day, adds Mr. Arnold, Moore, it is said, lost all heart for going on with his "History of Ireland," and it was by the importunity of the publishers which induced him to bring out the remaining volume. Mr. Arnold enters upon the question of the antiquity of the most noted specimens of Welsh literature, which are claimed to have been the product of the sixth century, but which their ablest disparager, Nash, would put down some six centuries later, and argues for the former date, giving some pretty conclusive reasons for so doing. He quotes in support of his position the singular tale of "Kilhwch and Olwen," from Lady Guest's translation of the "Mabinogion," almost every page of which, he thinks, points to traditions and personages of the most remote antiquity. "The very first thing that strikes one," he remarks, "in reading the 'Mabinogion,' is how evidently the mediæval story-teller is pillaging an antiquity of which he does not fully possess the secret; he is like a peasant building his hut on the site of Halicarnassus or Ephesus; he builds, but what he builds is full of materials of which he knows not the history, or knows by a glimmering tradition merely; stones 'not of this building,' but of an older architecture, greater, cunninger, more majestical. In the mediæval stories of no Latin or Teutonic people does this strike one as in those of the Welsh."

—M. Feuillet de Conches has addressed a note to the editor of the "Athenæum" in reference to the letters of Marie Antoinette, which were published last year by M. d'Hunolstein, to whom he was said to have sold the forged manuscripts, and the charges brought against him by the *Allgemeine Zeitung* in connection therewith, and with some forged letters of Racine, the substance of which we gave a week or two since. M. Feuillet contradicts the statement of the German paper; from the first paragraph to the last there is not one word of truth in it. As regards the letters of Marie Antoinette, he knew nothing of them until they were published. The history of the Racine letters is a pure invention. The story of the blank leaves said to be missing from autographs of the last century, in the Imperial Library, the abstraction of which is laid to his door, he declares to be another invention; he not only never consulted any documents of that period, his researches extending only in the sixteenth and seventeenth centuries, but the documents in question were never mutilated. Nor was there ever anything like a reclamation made, either against himself or anybody else, as is proved by the official communication of the Minister of the Interior. What his anonymous German accuser will say to all this remains to be seen. For the letters of Marie Antoinette, which lie at the bottom of this controversy, M. Louis Blanc, who ought to be a good judge of the matter, affirms that he is not surprised that their authenticity is questioned, and that he feels bound to say that, after having paid due attention to the controversy to which they have given rise, he is most decidedly under the impression that they are *not* genuine.

—It is well enough, perhaps, to keep a diary, if one is so inclined (Dr. Johnson, indeed, recommends the practice), but not many diaries will bear reading a few years after they are written, and not one in five hundred, no matter who the writers of them may be, will bear printing. Take the diary of Byron, for instance—it is little but a careless jotting down of his crude reflections on the men he met and the books he skimmed, the whole abounding, as some one has said, with the strong expletives with which draymen favor their horses. We learn from Moore's diary that he frittered away his time at breakfasts and evening parties; that he took ices at Tortoni's; and that, once in a while, "dear Bessie" was remembered. The diaries of statesmen ought to be better, one would think, keeping in mind the superior gravity of their occupations, but they are not—being, if anything, more trifling and jejune. One of these mistaken performances, "The Diary of the Right Hon. W. Windham," has lately been published; why, it is not easy to say, since it contains so little that is interesting. Windham was a noted man in his day, a speaker in Parliament, a cabinet minister, and what not besides; his contemporaries christened him "the finest gentleman of the age, the ingenious, the chivalrous, the high-souled Windham;" and Pitt declared his speeches to be the "finest productions possible of warm imagination and fancy." Windham, however, had a much less exalted opinion of himself, for mentioning one of his speeches, which was considered a capital performance, he adds: "There is not a speech of mine which in comparison of one of Francis's would, either for language or matter, bear examination for one moment; yet about my performances in that way a great fuss is made, while of his nobody speaks a word." Windham's diary is crowded with the names of celebrated persons, about whom, however, he tells us nothing, tantalizing us by such mentions as, "Dined with Sheridan; present Fox, Parr, Grey, Lord Grenville, etc." Burke's rejection of the friendship of Fox is entered thus: "Committee. Fatal day of rupture with Burke! I had gone down earlier in consequence of note from Wilberforce, and did not return home from the Committee, but got some soup with Francis at the Spring Garden Coffee House. It was latish before the House broke up." Burke at one time is "peevish and impatient," at another he makes an

'intemperate attack" on Windham for some trifling difference of opinion. Windham admired and respected Burke, however, especially after the publication of his "Reflections on the French Revolution," of which he wrote, "One would think that the author of such a work would be called to the government of his country by the combined voice of every man in it. What shall be said of this state of things when it is remembered that the writer is a man decried, persecuted, and proscribed; not being much valued even by his own party, and by half the nation considered as little better than an ingenious madman?" An odd trait in Windham's character was his love for what is rather dubiously called "the manly art," his diary containing references to fourteen or fifteen different prize-fights. On one occasion he left before the last battle was over to be in time for the House; on another he goes to see Cribb fight Gregson, and returns to town not to practice with his master, as Byron would have done, nor to lose his money at cards, as Fox would have done, but—to commence a treatise on Negative Signs! Windham was reverently attached to Dr. Johnson, of whom we have but a glimpse in his diary, as Johnson died in the year in which it was begun. He visited Johnson on his death-bed, and tried to persuade him to take some sustenance. "I then said I hoped he would forgive my earnestness, or something to that effect; when he replied eagerly, that 'from me nothing would be necessary by way of apology,' adding with great fervor, in words which I shall (I hope) never forget, 'God bless you, my dear Windham, through Jesus Christ,' and concluding with a wish that we might meet in some humble portion of that happiness which God might finally vouchsafe to repentant sinners. These were the last words I ever heard him speak. I hurried out of the room with tears in my eyes." This passage, and a brief account of his interview with Burke two days before the death of the latter, are by far the best things in Windham's rambling and meagre diary.

—The study of Sanskrit, which is on the increase in England, has not resulted there in as many poetical translations from that language as might have been expected, the most notable so far being Horace Hayman Wilson's "Cloud-Messenger" of *Kalidasa*, his collection of Hindu dramas, Monier Williams's version of *Kalidasa's* "Sakuntala" (with the metrical parts rendered into English verse), and Dean Milman's translation of the episode of Nala and Damayanti in the "Mahábhárata," the substance of which was woven into a unique story by an American writer, and published in one of the early volumes of "Putnam's Magazine." To this scanty store of translations may now be added a volume of "Idyls from the Sanskrit," by Ralph T. H. Griffith, principal of the Sanskrit College, Benares, the aforesaid idyls being translations of passages from each of the great Sanskrit epics, the "Rámáyana," the "Mahábhárata," the "Raghuvansa," the "Kumára-Sambhava," and the "Ritu-sanhára." Faithful to the spirit of Sanskrit poetry, which in the main is long-drawn and wearisome, Mr. Griffith's translations will not be found attractive by the general reader, although not without value to the lovers of curious lore. The best thing in his volume—a description of the rainy season in Hindustan—is almost perfect of its kind, being as dainty a lyric, in the Elizabethan sense, as one could wish.

SCIENTIFIC.

Animal Grafts.—The possibility of engrafting one part of a living animal on another portion of the same animal, has long been recognized as a physiological fact, and underlies the whole practice of "plastic surgery." A lost nose or an unsightly opening in the face may be, in a great degree, remedied, at least as far as appearances go, by such an operation. But in these cases the old connections are not wholly destroyed until the new ones are established. The skin out of which the substitute for a nose is made is allowed to retain an attachment to, and derive nourishment from, the forehead until it forms a union with the parts with which it has been newly brought in contact, and only then its old connections, becoming unnecessary, are divided. Completely severed fingers sometimes unite when carefully brought together, and teeth which have been knocked wholly out will re-unite with their sockets when replaced. Individual tissues, as parts of a muscle, nerve, etc., have been from time to time transferred from one animal to another, where they have formed an organic union and lived.

The recent experiments of Bert in grafting, more than eighty in number, and for which he has received a prize from the Academy of Sciences in Paris, are the most complete hitherto recorded, and some of his results show a greater persistence of life in separated parts than had been previously supposed possible. They consisted chiefly in transplanting the tail, or other parts, of one animal into or beneath the skin, or into the cavity of the abdomen, of the same or of another animal. The following will serve to illustrate the nature as well as some of the results of Bert's observations. The tail of a rat was cut off, a portion of its end was deprived of its skin, and then inserted into an opening on the back and secured in place; a complete adhesion of the parts followed, and the tail was sufficiently nourished in its new position. In another case a piece of tail 2.5 centimetres long, from which the skin had been removed, was inserted under the skin of another rat, so as to be completely covered in; the wound soon healed. Two months afterwards, by manipulating through the skin, one of the vertebræ of the transplanted part was fractured; about three months from the beginning of the experiment the rat was killed, and the fragment of tail had not only formed an organic union with the surrounding parts, but had grown from 2·5 to 9 centimetres in length, and the fractured portions had united, showing that its life was fully maintained. In like manner, the foot of one rat, from which the skin had been removed, was inserted under the skin of another, where it formed a union and increased considerably in size.

The following experiment has an important bearing on the physiology of nerves, since it adds another fact in evidence that nerves are more indifferent as conductors than has generally been supposed. The prevailing view has been that sensitive nerves only conduct impressions inwards to the nervous centres, and motor nerves from the centres outwards. The curious experiment of Vulpian, though as yet it has not been often repeated, tends to show that this is not true. He divided the motor and sensitive nerves of the tongue, and, crossing them, united the ends of the first with those of the second. After the union was complete he was able to excite muscular contractions by stimulating the sensitive nerve, which readily transmitted impressions made upon it to the motor nerve. It will be seen that in this case the sensitive nerve acted in a direction opposite to that in which it ordinarily acts. Bert engrafted the tip of a cat's tail into her back, and, after the union was completed, severed it at its base, so that it then hung from its tip and received its nourishment in a direction the reverse of the natural one. The sensibility of the tail was at first destroyed, but at length returned after a union had been formed between its nerves and those of the body. When it was pinched she defended herself in the usual way. Here, too, the nerve transmitted its impressions in a direction the reverse of the natural one, the tail having been turned end for end.

The time for which a part may retain its vitality after being separated from the body was also investigated, and, if Bert's observations are to be trusted, is much longer than has been supposed hitherto. Two young rats had each a piece of its own tail four centimetres long, and an equal piece of the tail of another and adult rat, engrafted into its body, after the parts had been detached from their living connections for twenty-four hours; during this interval the parts were kept in a glass tube inverted over water. They formed a union in their new places, and the immature tails increased in size. Successful grafts were made in other cases after the separation had lasted in one instance for twenty-six hours, in another three days, and in another eight days, the respective tails being enclosed during these periods in tightly corked tubes, and kept at a moderate temperature. He has shown by a series of experiments that the maintenance of a steady and moderate temperature during the period of separation is important. In parts kept at a temperature of from 50° to 54° F. the vitality persisted for several days; at 68° for seventeen hours; and at 86° only seven hours and a half. That the parts had fairly formed a living connection in the above instances was shown not only by their adhesions, but by the aid of injections, which proved that the blood vessels of the body and the graft communicated with each other.

Bert has not been successful in engrafting parts of a given animal on to another of a different genus.

Concerning the Preservation of Eggs.—In one of the French agricultural journals M. Bournouf brings forward a method of keeping eggs which would appear to be a reduction to its lowest terms of the system of preservation based on the exclusion of air by means of varnishes. A host of empirical methods based upon this general idea have been from time to time devised. Among them, one of the more recent is the application of a coating of silicate of soda, thus: the eggs are placed in an aqueous solution of the silicate (water-glass) maintained at a temperature of about 85°, are pressed down beneath the surface of the heavy liquor, and kept immersed there during some ten or twelve minutes. On removing the eggs and allowing them to dry in the air, they become covered with an air-tight coating of the soluble glass, and, as is asserted, may now be preserved for almost any length of time—best, no doubt, in air-tight and dry boxes.

Bournouf's process is more refined than this. He prepares a pomade by dissolving one part of bees-wax in two parts of warm sweet oil, and smears this unguent over the egg until the shell has been completely covered with a thin layer of it. By degrees the egg will absorb the oil, and each of the pores of the shell will thus become filled with wax, so that the contents of the egg will at length be completely shut off from contact with the air. M. Bournouf affirms that he has himself eaten eggs which had been kept in

this manner for two years in a place exposed to no wide variations of temperature. He is even of opinion that eggs kept in this way for a very long time are still susceptible of being hatched.

Fusibility of Silica.—Two distinct modifications of silica are known to chemists. As it occurs in the first of these modifications, the silica is readily soluble in alkaline leys and in hydrofluoric acid; while it dissolves with comparative difficulty when in the second modification. To the first or amorphous modification belong the minerals opal and hyalite, also the infusorial earths, such as the well-known "tripoli" or polishing powder. The specific gravity of the silica of this modification varies between 2.2 and 2.3. The second modification, the specific gravity of which is equal to about 2.6, and which is often found in nature in the form of crystals, includes quartz, rock crystal, and amethyst, as well as silicious sand, and the sandstones which have been formed by the agglomeration of particles of the latter. As an appendix to this second class a third list is often made out of the semi-crystalline varieties of silica, viz., chalcedony, chrysoprase, flint, and hornstone.

It has long been known to manufacturers of crucibles, fire-brick, and the chemical compounds of silicic acid, that the quality of the sand employed in their mixtures may exert a marked influence upon the fusibility of these mixtures or upon that of the products obtained from them. The sand of certain localities has thus come to be sought for by one class of manufacturers who desire to melt their materials readily, or with the least possible expenditure of fuel; while the same sand is held in no repute by those who aim to produce highly infusible products.

Some light has been thrown upon this point by the experiments of Bischoff, a German chemist, though his results do not go to corroborate so fully as might have been anticipated the old division of silica into two modifications. Samples of each of the common varieties of silica having been ground to impalpable powder in agate mortars, this powder was boiled with muriatic acid in order to remove any trace of impurity, and was afterwards rinsed with water. The moist powder was then moulded into little cylinders or prisms, which, after having been placed in crucibles of the most refractory fire-clay obtainable, were exposed to a degree of heat superior to that at which cast-steel melts. From the results of these trials it appeared that flint and rock crystal are the most difficultly fusible of all the varieties of silica. The external surfaces of the test cylinders composed of these minerals were glassy after the ignition; but, on breaking the cylinders, their fractured surfaces exhibited nothing vitreous, but only a granular structure. In the case of opal, vitreous spots were noticed upon the fractured surfaces. After opal, as regards refractoriness, followed amethyst, chalcedony, hornstone, hyalite, crystallized quartz, and milky quartz, all of which exhibited a fracture more vitreous than granular. Least difficultly fusible of all was the infusorial earth.

Mixtures of amorphous silica and alumina or clay were found to be less difficultly fusible than pure silica. Mixtures of crystallized silica with fire-clay are also, it is true, somewhat less difficultly fusible than the pure silica; but they are decidedly more refractory than the mixtures which contain amorphous silica. It will perhaps be found that while the amorphous silica may act as a flux and lessen the refractoriness of the clay, the crystallized silica may, on the contrary, increase its power of resisting heat.

The predilections of manufacturers for the silica of special localities now admit of explanation. It is by no means a matter of indifference to the manufacturer of refractory wares, which are intended to withstand intense heat, what kind of silica shall be mixed with the clay. If, for example, there were to be used the amorphous infusorial earth, no such refractory product would result as could be obtained by employing crushed flints or clean quartz sand. For the manufacturer of silicate of soda, on the contrary, this same infusorial earth would be far more valuable than the crystalline sand.

PROFESSOR SILLIMAN'S MEMOIRS.*

A few men only may be pronounced fortunate in all the circumstances of their lives. Fewer still are happy in the time and accompaniments of their death. Perhaps fewer than either of these classes, whose lot it is to have their lives written, are altogether happy in their biographers. The late Professor Silliman seems to have been fortunate in all these particulars. His life was a continued course of sunshine, the brightness of his mid-day answering to the brilliant promise of the morning, and passing by gentle transitions into the serene and softened glow of a cloudless sunsetting. His death was a veritable *euthanasia*, quiet, peaceful, sudden—a literal breathing away of the spirit in love to man and in praise to God. His biography is modestly and judiciously edited, the story of his life being told in wise and skilfully adjusted selections from his own personal reminiscences, his copious journals, and his extended correspondence. The taste and good judgment of Prof. Fisher can only be fully appreciated by those who know how much he was obliged to omit from the plethoric abundance of material, and how delicate was the task of drawing the line between the too much and the too little. Still, even those who know little upon these points will, we think, be satisfied in the main that the book is one of the best specimens of a biography of the kind which has been prepared in this country. It gives proper prominence to the central figure—the man himself in the exhibition of his personal characteristics. A stranger to the person of Professor Silliman would gain from his journal and letters, as here given, a vivid and correct impression of him. His public and professional career is exhibited with greater prominence than is usual, but with no excess in the case of one who was so distinguished as a professor and public lecturer. To say less of him in these relations might have been suitable in the case of almost any other university man, but would have been out of keeping in his. To dwell so minutely upon the beginnings and the progress in this country of the sciences which he taught, would have been surplusage in the life of any other single American than the one whose personal career was a succession of plans and enterprises for the introduction and the growth, for the defense and the adornment, of those sciences. His very person was associated in the minds of his friends and the public with the branches of knowledge for which his brain, his pen, his tongue, and his purse were brought into constant requisition. The details of his personal feelings, the minute and frequent references to his family life, the copious selections from his own letters and from those of his friends, are all appropriate in the life of one who interested himself so warmly in the affairs of his fellow-men, and who confidingly believed that they were equally interested in everything that concerned himself.

This biography will excite very general interest and be esteemed of permanent value because, also, it presents a continuous picture of the general history and progress of the country from the beginning of the present century, as this history and progress were reflected in the mind of an unusually public-spirited yet charitable and truth-loving man. His predilections or prejudices, if he had any, were all in favor of truth and goodness and order. He represented in his own person some of the most important public interests. He was connected with an institution to which young men resorted in great numbers who represented the wealth, the culture, and the opinions of every part of the country. His acquaintance with distinguished men in every department of public and professional life and holding every form of political and religious opinion, was very extensive. To read his life is to review the political and scientific, the religious and social, history of the country for the last half century.

The book also contains very many sketches of distinguished persons, from the pen of Professor Silliman. To describe the men whom he had honored in his youth and with whom he had associated in his mature years was a passion with him. These descriptions were a chief attraction of the first series of his travels, for they brought distinctly before the mind of the American people the personal appearance and manners of many distinguished men whose names were familiar. In the record which he made of his earlier life he regarded it as a duty and a pleasure to give minute and extended notices of all those persons who were familiarly known by himself, that the impressions on which he dwelt with so fond an interest might be preserved for others. In his letters he dwells with a peculiar satisfaction upon the appearance and manners of those persons whom he met in society. His fondness for detail and his patience in, or rather his passion for, composition contributed greatly to the fulness and the number of these descriptive sketches. This life is not merely a picture of the times in which Professor Silliman lived; it is also a portrait gallery of a great number of the men with whom he associated.

But the chief interest of the book pertains to the character of the central figure, the professor himself. We almost see the inner life of the man, so transparent are all the revelations which are made of the motives and aims of his being. We mark the steady and harmonious development of this life from the first frank revelation which he makes of his aims and aspirations to the last record which he enters upon his journal. The beauty of his face, the stateliness of his person, the elegance of his bearing, the ease of his manners, the fluency of his speech, the copiousness of his rhetoric, the readiness of his compliments, are all brought distinctly before us. We

* "Life of Benjamin Silliman, M.D., L.L.D., late Professor of Chemistry, Mineralogy, and Geology in Yale College. Chiefly from his Manuscript Reminiscences, Diaries, and Correspondence. By George P. Fisher, Professor in Yale College." In two volumes. New York: Charles Scribner & Co., 124 Grand Street. 1866.

see that his intellect must have been quick to apprehend, curious to acquire, and ready to recall. His power of work was astonishing. His mind moved so easily that to read and write for many hours seemed to bring little exhaustion. He would converse with little excitement to himself, but always with sustained and cheerful animation. He would discourse often eloquently, always fluently, upon a great variety of topics, passing rapidly from one to another, never abating his freshness to the end. His sympathy with men was wide in its range, embracing all classes, requiring moral worth as the sole condition. To the high in social position he rendered a most courteous and willing deference. To the lowly and humble he was always friendly and sympathizing. He never forgot an old friend who had not forfeited every claim to his regard, and even those who had cut themselves off from his intercourse were remembered by him with some word of pity. Even chance acquaintances who had rendered him only a casual service were remembered and often spoken of with regard. The readiness and breadth of his sympathies explain his very general popularity. A genuine benevolence, founded upon fixed and strong moral convictions, sustained and regulated this plastic and pliant nature. An earnest religious faith, with devout habits of life, gave to his moral principles fervor and earnestness. In his family he was in early life the devoted husband and fond father; in middle life, the wise and sympathizing friend; in old age, the benignant and beloved patriarch. Among his neighbors he was most attentive, kind, and courteous. In the community he was respected as one ever ready to promote the public interests by his generous public spirit, and was pointed out with pride as the man whose name was an honor to the city in which he lived and died. The very house in which he lived was, like himself, plain, hospitable, yet full of the memorials of his friends and of the tokens of public esteem. The college with which he was connected for sixty years was regarded by him with fondness and pride. He knew that he had done much for its prosperity, and yet he felt for its honor and success an interest which never abated. It was associated in his mind with the highest of public interests, the cause of learning and of religion, and in his heart with the revered President Dwight, who had marked out his career and had foreseen his fame, and with the associates of his youth and the companions of his old age, the classical and critical Kingsley, who died before him, and the sagacious and clear-minded Day, who lingers behind. The thousands of pupils in whose memories of Yale College Professor Silliman presents himself so prominently, all regard him as the instructor and friend who kindled their enthusiasm for the brilliant and useful sciences which he taught, and who at the same time won their hearts to himself by his courtesy and kindness. For the sciences of chemistry, mineralogy, and geology, in this country, he did heroic service by the enterprise which led him to acquaint himself at the beginning of his course with the ablest living teachers in Great Britain, and by the rare power of eloquent exposition which was so useful in exciting the interest of his earlier pupils and in fascinating the public. He did much, also, by the generous kindness with which he furthered the plans and wishes of young men who aspired to become proficients and instructors, and by the hearty interest with which he recorded their success. The self-denial and hazard of pecuniary loss with which he originated and sustained the "Journal of Science" for so many years would alone bring the whole country under heavy obligations to him.

So thoughtful and public-spirited, he must of necessity take a warm interest in the politics of his country. Yet he was never a politician in the common acceptation of the term. In ordinary occasions of political strife he was too catholic in his sympathies and too charitable in his feelings to be ever very warmly excited. But the Kansas outrage stirred his whole soul to its depths and moved all the capacities of his soul for indignation. Unexpectedly this universal favorite at the South, as well as at the North, found himself delivered from the "woe" caused by all men speaking well of you (the only woe to which he was ever exposed), by being innocently associated with a proposal to arm innocent emigrants against ruffifians invading their political rights and their quiet homes. During the war for the life of the nation he was anxious, prayerful, yet full of courage and hope. On the morning of the national thanksgiving he awoke to give audible utterance for the favor of God to the country, especially in raising up "that great and good man, Abraham Lincoln," then to pray for his family and to bless his wife for her affection, and, without a thought of death, to pass onward to another and better life.

The example of such a man in so long a life is a legacy of inspiration to the young men of the country, and not least valuable or important to the devotees of science, to lift them above the sordid and material aims, the petty rivalries, and the selfish ends from which even the most accomplished culture and the largest attainments and the widest acquaintance with men are not certain to deliver them. We are grateful for the life which glows with such inspiring influences and to the biographer who has skilfully arranged its records.

The Giant Cities of Bashan, and Syria's Holy Places. By Rev. J. L. Porter, A.M., author of "Five Years in Damascus," "Murray's Hand-Book for Syria and Palestine," "The Pentateuch and the Gospel," etc. (T. Nelson & Sons, New York.)—This is a well-written, very interesting book. It bears evidence throughout of the closest observation and the most diligent research. We have many books of travel in which the problem seems to be how to expand the minimum of observation into the maximum of printer's ink. But Dr. Porter's problem seems to be how to compress a vast amount of observation into the dimensions of an ordinary book. The result is not so much a book of travel as a volume of topography. The joy of travel is not more in seeing this or that mountain or city than in going from place to place. Men with a genius for travel enable us to feel that we are journeying with them, and in this way refresh us. Montaigne and Heine have been in this respect our truest friends. They are not too tremendously in earnest. We are permitted to see everything with their eyes in a very easy, desultory way, and are not always out of breath from being hurried through on an excursion ticket, as it were, from place to place. But the animus of Dr. Porter's book is very different from this. It has a critical, not an æsthetic aim. It does not seek the reader's enjoyment, but his instruction. The journey is nothing, its termini are everything. But there are passages of very eloquent description, and many facts that students of the Bible will find helpful towards an elucidation of the sacred text. The oft-repeated story of how the Eastern shepherd *leads* his sheep and they *follow* him, is here told very happily. A part of these researches are remote from the more ordinary course of travel, and are more interesting on this account. But the familiar Holy Places have at the same time been visited and cross-examined in the hope of gaining further information to support the general thesis of the book, which is, that Bashan's Giant Cities and Syria's Holy Places are a mine of argument in favor of the credibility of the Bible narrative and a remarkable fulfilment of its prophecies. The candid reader, while conceding that the book illustrates many things spoken of in the Scriptures, will doubtless feel that Dr. Porter overrates the worth of his investigations. What has been called "the topographical fallacy" appears so frequently as to impair our general confidence. That fallacy consists in arguing that because Mt. Sinai can be identified, *therefore* the things reported to have happened there did really happen; or, again, that because a certain thing might possibly have happened in a certain place, it did actually happen there. Anybody who wishes to see this fallacy exposed with all the pleasantry and satire of which the French language and the French genius are capable, will be satisfied on reading Victor Hugo's last work, "The Toilers of the Sea." As an appeal from Bishop Colenso and the results of criticism, the book before us is of comparatively little worth; but as a report of what is actually to be seen, it can doubtless be relied upon. As an illustration of the sacred narratives, it should be highly prized. It is handsomely reprinted from the London edition and has numerous illustrations.

Poor Matt; or, The Clouded Intellect. By Jean Ingelow. (Roberts Brothers, Boston.)—It is natural to have high expectations of any new work from the hand that wrote "A High Tide on the Coast of Lincolnshire," and if a little disappointment is the result of reading such a one, it is due rather to the unusual merit of the singer than to want of power in the story-teller. "Poor Matt" is an infinitely touching story. Matt himself is an idiot boy, rather attractive than repulsive, whose mind has been strongly laid hold of by one idea—the idea of God. All he has been able to grasp of this, which is the barest possible outline, has been taught him by the pastor's wife, some time dead when the story opens. His education is carried on by a lady who first sees him, in one of her walks, as he is standing by the seashore, absorbed in gazing at a rift in the sky between two clouds. In reply to her question as to what he is doing, he says, "Matt was looking for God. There was a great hole—Matt wanted to see God." The lady is not only "astonished" but "shocked" by this answer; but Matt accepts all that is told him with absolute literalness. Thus, when his grandfather dies, and it is explained that God "sent for him" to a beautiful place "where there is no sea," no storms, no cold; whereupon Matt urgently desires to be "sent for" too. He insists on having his "hands washed" and his "best cap on," in order to "be ready," since he is told he may be summoned at any moment. A moral is drawn from this by "the lady," for the instruction of the peasants present; one of the many morals which Poor Matt is made to point by his earnest, undoubting remarks; and they are well pointed, too, with a graceful seriousness which more than offsets their slight suggestiveness of "tracts." A strong and true religious conviction will carry much narrowness of belief. And if "the lady" does count too surely on Matt's understanding and receiving the doctrine of vicarious atonement from her ingenious method of conveying it to him, any one who doubts her success or the necessity for such an explanation to an idiot, will be robbed of desire to find fault by the beautiful liberal spirit pervading the whole of her patient teachings.

The close of the narrative is written with fine pathetic power. Matt suffers greatly from cold and hunger during a hard winter, his aunt dies, he is often beaten by a boy that is set to take care of him, "his lady," as he calls her, has been summoned from the neighborhood, and God, spite of his constant appeals, will not "send for him." One bitter night he escapes from the house and is found at the mouth of a cavern in the cliffs on the sea, standing with arms outstretched and woe-begone face fixed on the sky, crying, "God, God! oh send for poor Matt; let Matt go away!" The little girl—a real heroine—who finds him, runs back to get assistance; but Matt is frozen to death before it comes.

The Book of Roses. By Francis Parkman.—*Cultivation of the Grape.* By W. C. Strong. (J. E. Tilton & Co., Boston.)—These books come to us in a very attractive form. They are of convenient size, and the paper, printing, embellishments, and finish are unusually good, so that they will as often find a place on the centre-table as on the library shelves. The "Book of Roses" will please those who endeavor to beautify their homes with the "queen of flowers." It is a valuable manual for all who cultivate this popular shrub, whether expert or amateur, giving precisely the information on the subject so many persons need and desire. It is especially valuable to those who have but limited experience in the cultivation of the choicer varieties. It is beautifully adorned with cuts, but not illustrated.

The "Cultivation of the Grape" has more competitors in the field, several of which it does not surpass, except in the style in which it is offered. The book is very unequal in its parts, and very often leaves us in doubt which of several processes or methods described the author considers the best. The part relating to the propagation of the vine is most successfully treated, and we opine that in this branch of the subject the author has had the most experience. There is also much really valuable information relating to the management of vines and the treatment of their diseases. But Mr. Strong often indulges in hypotheses and "theoretical considerations" where we want plain statements of observed facts and the results of experience. The amateur cultivator especially wants the results of proved, or at least tried, methods, rather than suggestions of untried ones. The chapter on manures for the vine is very unsatisfactory. Many of the theoretical considerations are apparently derived from a perusal of the older works on agricultural chemistry rather than from the experience of vine-growers. That most important consideration of the effect of the various fertilizers recommended on the quality of the fruit, and on the wine made from it, is left out of consideration entirely. We notice, also, an insignificant error which probably first originated in a typographical blunder, and has since been copied into a number of works on the grape. The great California vine (mentioned on p. 15) is nearly *three* feet in circumference and not *ten*, as it is often printed. The illustrations are tasteful and accurate. A good index would increase the value of the book, although the table of contents is full and the arrangement of subjects judicious.

Cherry and Violet. A Tale of the Great Plague. By the author of "Mary Powell." (M. W. Dodd, New York.)—This little volume could have had no better introduction to the public than its two charming predecessors, "The Maiden and Married Life of Mary Powell" and "The Household of Sir Thomas More." The present story suffers in comparison with these because it is more dependent for its interest upon its incidents than upon its characters. The great plague is a very interesting theme, especially in these days of waiting for the cholera, but not so interesting as a great man like Milton, or Milton's very charming, very silly, little wife. And the great London fire, which burned up thirteen thousand houses in three days, is very interesting, but not so interesting as Sir Thomas More. But for all that it may suffer by comparison, the book, considered by itself, is very readable. It makes the life of just two centuries ago seem very near and actual. Cherry, who is supposed to write the history, lives with her father in his little shop on London Bridge. When the Protectorate is over, and Charles II. returns, of course they have the best of opportunities for seeing him. The fluctuations of the father's trade (he was a hair-dresser) consequent upon the Protectorate and afterward the Restoration, are depicted pleasantly enough. But the most artistic thing about the book is its apparent failure to appreciate the magnitude of these events with which it is concerned. The writer never once forgets that she is not herself but Cherry Curling, and she manages her facts accordingly.

EXPECTED WAR IN GERMANY.

WAR is expected in Germany, and the sudden announcement of it has thrown the whole political and financial world of Europe into the greatest confusion. The designs of Bismark have at last become dimly visible. "Romprons-nous ou ne romprons-nous pas?" say Austria and Prussia to each other, like the *soubrettes* and the *scapins* of Molière. Austria is arming. Prussia is arming. Austria will not attack, and Prussia will not attack. And still everybody believes in war. How is this? It is simply because Bismark is considered as very ambitious, very unscrupulous, very imprudent, but not absolutely mad. And if he prepares to go to war in spite of the German middle states and princes, in spite of England and Lord Clarendon, in spite of diplomatic protestations and assurances, in spite of the Prussian parliament, it must be that he has very good motives for it—some hidden reasons which he is not yet at liberty to make apparent to the world.

It is impossible to see why Germany should be convulsed by civil war; why a new thirty years' period of agitation, discord, and bloodshed should begin in the midst of the nineteenth century; why the question of the two miserable Duchies of Schleswig and Holstein should not be amicably settled between Austria, Prussia, and the Bund; but the absurdity of a war between Austria and Prussia does not, alas! make such a war impossible. There is no holy, no lofty principle which obliges the Germans to meet each other on new battle-fields; but are men always influenced by lofty and holy principles? The dream of German unity would be at an end if the various sections of Germany were armed against each other; but Bismark cares not for Germany, but for Prussia. He wishes to leave Prussia to his successor a strong, compact military power, and he is willing to adopt every means to that end. He said once, "I am willing to give to France the Rhenish provinces, if I am allowed to take in Germany all I want and to make Prussia as strong as I wish; for, once strong, Prussia will easily retake the Rhenish provinces from the hands of her neighbor."

Bismark has been, very improperly, in my opinion, compared to Cavour. The cases of Germany and of Italy are very different. In Italy, Cavour had a double object—the expulsion of the foreign invaders and the creation of Italian unity. Germany has no foreign tyrants, and German unity could not be promoted by a war which would allow the foreign powers to interfere between the German combatants. It is evident that Bismark would never have gone as far as he has if he was not secretly assured of the support of the French Emperor. Bismark cannot believe that Prussia is capable of overwhelming Austria together with the middle states of Germany. Therefore, as he shows himself disposed to bully Austria into war, he must feel assured of a powerful assistance. Will Italy alone be his ally? Nobody in Europe believes it. Prussia could no more with the help of Italy than without it conquer Austria and Germany. Some other ally must be found stronger than Victor Emanuel. The King of Italy, or even Garibaldi, may, as the French say, "mettre le feu aux poudres" in Venetia; but the drama once begun, the principal scenes will not be played across the Alps, but across the Rhine.

France must ultimately come into action, if Bismark wishes to annex to Prussia not only the Danish Duchies, but the small kingdoms and principalities of central Germany. Already Bismark speaks of the revision of the federal congress, and proposes to elect a great German parliament by *universal suffrage.* Universal suffrage! Is not this an echo of the Tuileries? Does Bismark, who has so often treated his own Prussian parliament with contempt, and who professes openly to disregard constitutional institutions,—does he pronounce these fateful words, "universal suffrage," with the same spirit as a Gladstone or a Bright? To him, as to his Imperial model and eventual ally, universal suffrage is simply a weapon by which old governments can be destroyed and old rights thrown to the wind. Universal suffrage has given to France the province of Savoy, to Piedmont the Tuscan duchies and the kingdom of the Two Sicilies, to Maximilian the empire of Mexico; it can be used for all ends, good or bad, in countries where there are no traditions of self-government, no political franchises and guarantees. Where universal suffrage has not been heralded by universal education, it becomes the most powerful ally of force and despotism. Bismark hopes to have all his annexations ratified by universal suffrage; the French Emperor entertains similar hopes; but they both in their hearts trust only the *droit divin* of their improved artillery.

"La raison du plus fort est toujours la meilleure." And so the Continent is drifting into war. The French Empire needs it, because the Liberal movement is becoming too strong and too overwhelming. Napoleon III. once told a lady while he was still an exile, "It is very easy to govern the French." "What is your secret, prince?" "*A good war* every three years." Well, we have had the good war of the Crimea, the good war of Italy, the (not quite so good) war of Mexico—is it not time that we should have another?

All the *familiers* of the Tuileries, among whom General Fleury is just now the great favorite, are in exultation. At one blow, they say, we will get rid of French Liberalism, which is becoming troublesome, we will settle the Italian question, and take the Rhine. All the young colonels dream of *bâtons de maréchal* and of titles; all the young diplomats, of future congresses and diamond snuff-boxes. We are preparing for the great crisis in the midst of pleasure. Paris has never been so brilliant. We have the Diva Patti at the Italian opera and "Don Juan" at the French opera, Danish princes at court, four-in-hands with liveries of all colors in the Champs Elysées, beautiful American *odalisques* at our private theatricals (in the "Ours et le Pacha," played at M. Drouyn de Lhuys', the Minister of Foreign Affairs); the clubs are full, and we play cards till three in the morning; we have balls *in powder;* Thérésa is as deservedly popular as ever; and we have even turned the drama of "Barbe Bleue," the story which so often haunted our infant mind, into the most extraordinary buffoonery at the "Variétés." *King Bobèche,* who has an important part in the new "Blue Beard," tells his minister: "C'est en ne sachant jamais ce que je ferai que j'ai appris à gouverner les hommes." And we might say: "C'est en ne sachant jamais ce que nous ferons que nous avons appris à nous laisser gouverner." Shall we have peace or war? We don't know; therefore let us have pleasure.

A. L.

NATIONAL TREASURY SPECULATIONS.

Mr. Gladstone made some remarks in his recent "financial statement" on the general subject of national debts which suggest some reflections both as to the future of this country and that of Western Europe in the highest degree interesting. There is no incident of modern political history more striking than the rapidity with which great debts have been contracted by the leading powers of the world, and the almost reckless readiness with which these debts continue to be increased, even in times of profound peace. France owes $2,000,000,000; Spain owes $725,000,000; Italy owes somewhat more, and is fast increasing her liability; Austria owes $1,580,000,000; Russia, $1,395,000,000, and smaller powers, in some cases, in proportion, in others out of all proportion. Nearly all these debts have been contracted within twenty years, and Holland is the only power in Europe, though one of the smallest and weakest, which has done anything within that period to diminish hers.

The readiness to resort to this pleasant mode of filling the treasury is due first to the greater regularity and certainty which the growth of law, order, and civilization has communicated to the collection of revenue. Governments now know pretty accurately every year what their income is to be, something which until the close of the last century they can hardly be said ever to have known. Their credit has consequently greatly improved. At the same time, and owing very much to the same causes, the wealth of their citizens has increased to such a degree that there are now great numbers of persons in every civilized country who literally do not know what to do with their money. Capital has in most old countries accumulated in such masses that the present holders are at their wits' ends to make it produce anything. The bolder and more knowing ones go into foreign banks, foreign railroads, mines, quarries, aerial machines, and all sorts of outlandish schemes, nine out of ten of which ruin the projectors. The more timid wait till some government wants to borrow money, and then rush forward with five times as much as it wanted. In fact, considering the readiness of the public to lend, the wonder is that governments have not borrowed more.

The tendency of all governments to extravagance, from one motive or another, has, of course, been greatly increased by this facility in borrowing. They have been enabled by it to maintain enormous military and naval establishments, and to set on foot gigantic works of improvement or embellishment, generally undertaken in order to reconcile the masses to the absence or loss of their liberties and to maintain courts in a splendor which has never been witnessed before in modern times. Louis the Fourteenth's palace at Versailles, great as it was in its day, was a mean establishment compared to the Tuileries in our day.

The evident intention of all these great borrowers, and it is an intention in which they find no difficulty in getting their subjects to acquiesce, is to let posterity pay the piper, while the present generation does the dancing. But the question is now beginning to be asked seriously whether posterity will be able to pay the piper? Some countries which have hitherto, like Germany, France, and Russia, been retarded in their growth by bad governments, may possibly answer this question in the affirmative. They are now only beginning to run the great industrial race. We spoke, in the "Scientific Notes" of the last number of The Nation, of the extent to which certain great branches of manufactures are being transferred from England to the Continent, in spite of the great advantages in point of time and circumstances which the latter has enjoyed, and there is no question that this process will now go on more and more rapidly every day.

As regards England, however, the question cannot be answered with the same confidence. To her it is an awful question, and the manner in which Mr. Gladstone dealt with it opened up a vista of changes, both social and political, as the mere consequence of the rapidly approaching exhaustion of her coal-fields, which nobody now attempts to deny, more stupendous and momentous than any which have occurred in Europe since the fall of the Roman Empire. There is no doubt that as the coal-fields of England, or other natural advantages of that or of other European countries, begin to be worn out, and profits and wages consequently to fall, and the pressure of the taxation necessary to maintain the public credit to become consequently less endurable, persons whose property is movable, such as capitalists and persons who are dependent on their own labor, will emigrate to America, and other new countries. This will throw the whole burden on the landholders who remain behind, and who will have to remain behind, and it is not safe to say that they will be able to support it, or will even do so by submitting to great impoverishment. Should this state of things come to pass, the possibility to which we ventured to refer last week, that England would eventually become a great summer resort of the inhabitants of this continent, and occupy much the same relation to America that the Isle of Wight does to England herself, will certainly be realized.

In fact, unless some great change, a change for which at present we see no reason to look, should occur in the system of government now pursued in most European countries, we may fairly expect before very long to see the weight of taxation become so great as to overcome the strong feeling of local attachment, which is, in most places, the great impediment to emigration, and a tide begin to set in towards our shores from England and the Continent as great as that which we have now for some years been receiving from Ireland. It takes very strong influences to drive people into abandoning their ancient seats, but the movement once opened, its force increases in geometrical ratio.

PRICES.

Amidst all the divergences of opinion which distract the members of the Universal Yankee Nation—political, ecclesiastical, and economical—there is one on which they are of one mind. Nobody denies that prices are frightfully high. The great fact that we have to pay double for everything that we eat, drink, wear, or live in, is one level to the very meanest capacity. Prices had waxed fat before the war, even, and were almost double what they used to be in the days before California was invented. But the war necessarily increased the inflammation of our quarterly bills to a truly febrile virulence. The depreciation of the currency and the diversion of the labor of near a million men from productive to destructive pursuits sufficiently account for this state of things. The war being over, and the soldiers having been dispersed to beat their swords into ploughshares and their spears into pruning-hooks, and the growth of the national debt having been checked, the question presents itself to every mind, how soon prices will fall back to their old level or something like it? That there will be an approximation to that golden mean is certain, as the morbid stimulation of an inflated currency is gradually reduced, and only the wholesome tide of specie left to regulate the circulations of the body politic. Whether it be possible that the necessaries and luxuries of life can ever be restored to the *status quo ante bellum*, is doubtful. Certainly not without an intelligent direction and application of industry, such as does not yet seem to develop itself, but which certainly lies within the competency of the American people. At any rate, this is as good a time as any to take an observation, find out just where we are, and consider how we had best lay our course.

There are two very sufficient causes for the inflammation of prices, apart from the stimulus given them by the war—first, the actual diminution in the value of gold and silver; and secondly, the decrease in production when compared with the increase in consumption of the necessaries of life. It is with gold as it was with the Sibylline books, it increases in value as it diminishes in quantity, and *vice versa*. Whenever the dollar shall be restored to the throne again, almighty as it will but too certainly still be over men's souls, it will be of less relative power than ever before over their markets. In fact, it is the multiplication of the precious metals that has raised the nominal value of everything that they purchase, much more than the temporary influence of the war. For the same effect has been produced over all the world by the same causes. Since the gold discoveries in California and Australia the volume of the "all-worshipped ore" has been multiplied

beyond all former precedent and almost beyond imagination. It has increased immensely the actual wealth of the world by the impulse it has given to commerce and manufactures, and at the same time it has increased the prices of the commodities thus multiplied. It is only strange that this derangement of prices did not take place much earlier and more suddenly, considering what a multitude of millions was added every year to the currency of the world. This is accounted for partly by the increased use of the precious metals in the arts, but chiefly by its absorption by India, where the currency is almost entirely silver. And here is an example that it is not the quality of a currency but its redundancy that inflates prices. India used to be the cheapest country in the world to live in. Now, it is as dear as any, every particular of living having at least doubled in price within the last fifteen years, because there is twice the amount of currency in circulation. Just as in Canada, where our silver coin took refuge when we stopped specie payments here, a silver dollar would buy only ninety cents worth of merchandise. Still, as the printing press can coin money much faster than the mint, it is advisable to reduce the issues of the former agency to a convertible proportion with those of the latter with all convenient speed.

A similar revolution in values took place in the sixteenth century in consequence of the multiplication of silver after the conquest of Mexico and Peru. We find the dignity of the shilling expand and bourgeon as its pedigree ascends towards the dark ages, as if it were a royal or noble house. Forty of them stood for about as much as as many pounds sterling do now, or did twenty years ago. Forty shillings used to be a usual endowment of a scholarship at a university, and sums similarly absurd, as they sound to us now, were bequeathed for the foundation of schools and colleges. Even within the last century a very great change has taken place in the value of money. An income in England which was thought affluent a hundred years ago is little more than a competency now. And so in this country, without taking into the account the enormous fortunes which have risen like exhalations out of the soil of battle-fields, and which may possibly vanish like exhalations. How high the advancing flood of this golden tide may rise is beyond the skill of any weather-prophet to foresee, however skilled in the signs of the times. All that human wisdom can do is to stand ready to accommodate action to its exigencies, and to direct it as far as may be done for the general good, while guarding against private injury. When the level becomes tolerably well established, the change is more apparent than real. The capitalists receive larger nominal incomes, but as the things they must buy for support, enjoyment, or investment are proportionably dear, they are really no richer than before. Wages, too, must be borne upward on the advancing wave of gold, though they are too often the last to find their due level. Persons living on salaries and fixed incomes are the persons the most immediately impoverished by the change in the measure of values, until they, too, feel the upward tendency, which, sooner or later, they must do.

But the inflation of prices is due to another cause besides the multiplication of coin, viz., in the diminution in the production of the necessaries and luxuries of life of the value of which coin is the measure. We have to pay more for everything we eat, drink, and wear even than the diminished value of money would account for, because there is not as much labor and capital bestowed upon their production as in former years, in proportion to the increased demand for them. The haste to be rich, if not more innocent of old time than it is now, used to be more largely directed to more really profitable uses. The land used to be the principal investment for capital, not for the erection of castles in the air, of cities under water, and of corner lots in the wilderness, but for the actual multiplication of the kindly fruits of the earth. The tendency of the present time, everywhere, is from the country to the large cities, and thus to divert capital and labor from the soil. In the Old World land is still the chief element of wealth and political power, and, therefore, greater pains and larger amounts of capital are bestowed upon it to extort from its bosom all that skill, science, labor, and money can compel. Agriculture is the foundation of all wealth here as well as there. Nobody doubts this truth, but too many seem to wish that the foundation should be built upon by somebody else while he gives his energies to the lighter and more ornamental portions of the edifice of public prosperity. The opening of the South to free labor, as soon as our "misguided fellow-citizens" shall cease biting their own noses off to spite their faces (which they will soon find is an unremunerative expenditure of their energies), will perhaps tend to keep up the prices of other agricultural productions besides cotton and rice and, possibly, sugar. But this very circumstance may stimulate invention and direct capital to multiply them. Capital and skill are essential elements of prosperity in every branch of industry. The discovery will be made in time that there is no bank or manufactory so safe or so sure in its returns as the boon earth, in proportion to the investment of capital and skill committed to her charge. Then there will be a due adjustment of the industries that create the fruits of the earth, that convert them into various shapes, and that exchange them commercially in the wise organization of the great commissariat of the world. Until production shall have overtaken and outstripped consumption, there can be no material change in prices. It is a state of politico-economical transition that we are now passing through, to which we must adapt ourselves as wisely as we can, assured that the laws which Providence is striving to reveal to us will reduce everything to order and prosperity as soon as they are allowed to have their due sway.

THE DOOM OF THE DEADHEADS.

There is a fearful shaking among the dry bones. The ruthless hand of Albany legislation has been stretched forth to disturb the long rest which has brooded immemorially over the noble army of the Deadheads—an "exceeding great army," like that which the prophet Ezekiel saw in vision come together in the valley "with a noise and a shaking." The great vested interest in travelling at other people's expense has been assailed. The beatific privilege of paying one's fare with a smile is snatched away. The elect can no longer be wafted from one end of the land to the other through the magical properties of a scrap of paper no bigger than a man's hand, which put to an open shame the cheap conveyance of Prince Hussein's tapestry. It is no longer not merely glory, but great gain, to be the son, brother, second cousin, or grand uncle of a director. The lofty courtesy which passed the engine-driver or brakesman of the Poppasquash and Skunk's Misery Railway free over all other roads in respect to his exalted station, is forbidden by law. Even the freedom of the press is violated. Editors and reporters will henceforward be reduced to the level of common men, and have to pay their way like their even Christians. But this is too painful a theme to contemplate. Let us turn our eyes in another direction.

This great revolution has been forced through, apparently, in the interest of a class of persons who have not been usually thought of consequence enough for special notice. We mean the shareholders in the corporations thus magnanimously managed, and bent upon proving that they *have* souls, in spite of a profane and ribald proverb to the contrary. Unreasonable and impracticable members of this insignificant class have had their selfish passions excited for long years past, as they glided along on "the pale iron edge" they have paid for originally and paid again for the privilege of using it, at seeing a self-complacent citizen sitting next to them carried triumphantly along with them without money and without price. If of a mathematical turn of mind, the shareholder probably occupied himself surlily in cyphering out how much a fair average of such benevolences might amount to in the course of a year, and perhaps came to the conclusion that the mystery of dwindling dividends in the presence of growing travel might be thus partially solved. If of an impulsive and fiery temperament, he would be very apt to do what is of very evil ensample in any one connected with a railway, and "burst his boiler" at the next annual meeting of the corporation, and blow up the president and directors without mercy. But it is an idiosyncrasy in the natural history of presidents and directors that, like cats, they always come down on their feet, to whatever height blown up. The "set of querulous meddlers," as the *Times* might call them, is soothed by promises of amendment, which too often prove, like the promises of other great men, as well as pie-crust, to be made to be broken.

One of the great dailies, which we quoted just now, thinks it is

"almost impossible to speak seriously of the act" which proposes to circumscribe the majesty of the deadheads. It may be difficult to carry the law into effect and so it may become a just subject of ridicule, as all ineffective laws are; but it will be no laughing matter to many of that respectable portion of our travelling public if it be enforced. The existence of such a class seems to us the fitter provocation of merriment. We see no reason why a law so obviously for the benefit of railway property should not be carried into effect. The difficulty in the way of abating the deadhead nuisance long ago, by general consent of all the companies, has been the competition of selfish interests in their management. Every railway manager was apt to think that he was cunning enough to outwit his neighbors in the contest, and so to evade any arrangement that should deprive him of this species of bribery and leave travel to its natural conditions. Ten years ago, if we remember aright, the president of the Erie Railway urged a general alliance, offensive and defensive, against the incursions of the deadheads. But we presume the mischief had become too inveterate and the habits of railway management too depraved to make this possible. The interposition of the State gives them all now an opportunity to reform their ways, which, if they have grace to do it, will redound to the general benefit of the travelling public as well as to the particular emolument of the long-suffering shareholders.

We believe that it is to the universal Yankee nation that the English vocabulary owes the expressive neologism "deadhead." We are not sure whether or not our cousins on the other side have yet incorporated it with their daily speech. The thing they have most unquestionably, and, as we can never invent a new slang expression that they do not make haste to borrow, it is very likely they have the word, too. Like most abuses, its growth has been gradual. Like other parasites which attach themselves to great bodies, the deadhead system has waxed fat at the expense of the wholesome juices of the body it has grown to. It was originally contrived in the interest of the corporations. The president and directors were naturally and reasonably made free of their roads, then the members of their families, and it was a study to the genealogist to see how widely the ramifications of the directorial family-tree could extend; then all persons bringing freight were permitted to travel free; then all sorts of railway officials, from the president to the stoker, were passed free as a tribute to their official dignity. Editors of all sorts of newspapers were early given the run of all roads as a privilege duly appurtenant to puffery. And so the thing went on. Some of these excrescences have doubtless been cut off, but there remain enough to invite the excision of the legislative pruning-hook.

The mischiefs of deadheadism also attach to all public amusements, though they cannot be reached by law. If the managers of theatres and other places of public entertainment find it profitable or pleasant to give away sheafs of tickets, it is nobody's business but their own. But innocent spectators are often amazed to hear that certain theatrical or operatic enterprises are ruinous adventures when they see the houses full. In the simplicity of their good easy souls they do not dream how many of the best seats are filled by those whose entertainment is purely eleemosynary. There would be no *deficit* in treasuries if all paid honestly for their amusement. But as long as managers and agents will persist in pelting editors with free admissions and complimentary tickets, it is too much to expect of editorial human nature that they should be refused. The only concern the public has in this matter, and it is a material one, is that this system is all but fatal to genuine dramatic criticism. It has perverted what passes for such into mawkish and indiscriminate flattery. There are exceptions, doubtless, but the general feeling naturally is that it is uncivil to speak severely of an entertainment to which you have been freely invited, and that it is hardly fair to ridicule what your host has set before you. We imagine all the best journals would be willing to waive their courtesies and pay for the ticket of their critic on the usual terms. If it be an object to the managers of theatres to put a stop to this custom, it can be done by such a blessed conspiracy as that by which they have put to an open shame the ogre of the press who held them in a hopeless thraldom. But perhaps they had rather *not* have impartial criticism on what they give the public. It is their affair.

Correspondence.

THE AMERICAN LECTURESHIP AT CAMBRIDGE.

To the Editor of the Nation:

I have read your article on the rejection of Mr. Yates Thompson's generous offer of an American lectureship to the University of Cambridge. My own sentiments on the subject you may easily divine. They would be more appropriately expressed in an English than in an American journal. But there are two remarks which I will beg your permission to make as tending partially to qualify the view you have taken of the conduct of the university in this matter.

In the first place, I am told, and can easily believe, that among those who voted against the acceptance of the lectureship there were many who, while they entirely concurred with Mr. Thompson in the good object which he had in view, doubted whether the foundation of a lectureship of the kind proposed would be the best means of effecting it. I confess that I share this doubt myself. I think that in a place where so many lectures have to be attended for academical purposes, a course of lectures on a non-academical subject would run the risk of being very thinly attended; and I also think that unless the lecturer was endowed with singular tact as well as ability he might be in some danger of repelling those whom he was endeavoring to attract. I am inclined to the opinion that a good collection of American books and statistics made accessible to the students would be more sure of producing the desired effect. A collection of American books, chosen with perfect freedom as regards subjects and opinions, was, as I happen to know, very cordially welcomed by a college in this university; and I believe that any American visitor who enquires at the Bodleian Library will find that the American department there is already good and is being rapidly increased by past purchases.

In the second place, so far as the opponents of the lectureship were actuated by any antipathy, their antipathy was, I suspect, rather ecclesiastical than national. Of all your enemies on this side of the water, the Episcopal clergy have been the most bitter. But this phenomena is not peculiarly British, nor such as ought to provoke special resentment against this country on the part of Americans. It is the world-wide antagonism of the priest party to liberty of body and soul. You have Jesuits among yourselves. Were they very ardent in their loyalty to the national cause?

I am, sir, your faithful servant,

Goldwin Smith.

Oxford, England, May 1, 1866.

WHEELING.

To the Editor of the Nation:

In your issue of December 7, on page 722, occurs the statement, "A Hungarian . . . was broken on the wheel." I do not know from what German statement this has been translated, nor do I propose to make it the subject of remark; but I have never seen an English translation of the German term "rädern" or the French word "rouer," "to wheel," which did not render it "to break on the wheel." Even the "New American Cyclopædia" countenances this mistranslation. See its article on Patkul, and also Vol. XV., page 550, at foot of second column, under the remarks on cruel punishments appended to the article on torture. Webster in his dictionary regards the wheel not as an instrument of execution, but of torture or examination.

Pierer's "Universal-Lexikon," under the article "Raedern," defines it as a "severe death-penalty, in which the culprit, stretched on the ground, has his arms and legs broken and his breast crushed with the front wheel of a wagon." This corresponds with what I was told in Germany and German Switzerland by persons acquainted with the punishment, except that no particular kind of wheel was specified. At Fribourg, in Switzerland, however, I examined one which was evidently intended to be more efficient than a wagon wheel. It was, as nearly as I recollect, between three and four feet in diameter. Part, at least, of its circumference was shod with an iron attachment, hardly sharp enough to cut and yet sharp enough to render it more efficacious in breaking. A young man who accompanied me lifted it and remarked that he had, in 1820 or 1822, seen a person executed with it for killing one of his parents. The malefactor was bound on the ground to stakes and his limbs broken. The law, as I was informed at Berlin, recognizes two forms of "wheeling:" 1st. "From above downwards." In this form, the first blow falls on the victim's chest and is intended to kill him, the limbs being afterwards broken. 2d. "From below upwards." In this the limbs are first broken and the victim is afterwards despatched. This

latter form appears to be expressed in French by the term "rompre vif," or "rouer vif," to "break alive," or "wheel alive." A professor at Berlin told me that in the case of Patkul, the Livonian—an agent of Peter the Great—wheeled by the brutality of Charles XII., the wheel was destitute of iron and less efficient. This will account for Voltaire's statement (Histoire de Charles XII., Livre III.) that the sufferer received sixteen blows. Worcester in his dictionary, under the word wheel, states that "in France the criminal was laid on a frame of wood in the form of a St. Andrew's cross, with grooves cut transversely in it above and below the knees and elbows." This would render the executioner's blows more effective. His statement that in Germany "the criminal was laid on a cart-wheel, with his arms and legs extended, and his limbs in that posture fractured with an iron bar," must be exceptional if not partly erroneous. The iron bar, or club, was used in some countries (Pierer's Lexikon, Art. Raedern); and it was formerly, if it be not yet, customary to bind the body of a criminal AFTER execution on a wheel, and expose it to the public gaze.

"Wheeling," according to information which I received in Europe, is in some countries the recognized punishment for unusual crimes, including parricides and, since the king is legally construed to be the father of his people, for regicides. An extract subjoined below would seem to imply that a bishop is legally regarded as father of his flock, and that his murderer is treated in the same way. In the army of Frederic II., according to Archenholtz (Historische Schriften, Vol. I., p. 28), whoever carried insubordination "to acts of violence with weapon in hand was wheeled alive." During the winter of 1840–41, while I was in Berlin, a man, by some deemed insane, attempted the king's life. My landlady, the next day, repeated to me the opinion of others that some frightful punishment would be devised for the assassin. I smiled at the idea, but learned afterwards from competent legal authority that "wheeling" was the recognized punishment. After my return to America in 1841, probably within a few years afterwards, I cut the following from some newspaper, the name and date of which are unfortunately lost:

"DREADFUL SPECTACLE.—Rudolph Kuhnapfel, the tailor, who murdered the Bishop of Ermeland and his housekeeper, at Frauenburg, Germany, about six months ago, was broken on the wheel [*i. e.*, wheeled] on the 7th ult. He died in ten minutes. Ten thousand persons were present—half females."

Since writing the above, I notice that the last edition of "Webster's Dictionary" (1866) quotes from Brande essentially the same account of the wheel as is quoted in Worcester, implying that it is an instrument of *punishment*, but leaves unchanged the definition that it is an instrument for *torturing*. The difference between the two is correctly stated in the "New American Cyclopædia," at the beginning of the article on torture. One item omitted by that article was interesting to me and may be so to others. The civil law, as practised in some European countries, does not permit execution until a criminal has confessed his crime. Consequently, even in our days, persons who were deemed notoriously guilty have been tortured to make them confess.

F. HUIDEKOPER.

MEADVILLE, PA., May 9, 1866.

COTTAGE ARCHITECTURE.

TO THE EDITOR OF THE NATION:

In the May number of "Harper's Magazine" is an article in which the subject of the proper arrangement of a cottage residence of moderate size is taken up and discussed, and the ideal of the author is given in a series of neatly-drawn plans. The professed intention is to show that in a house about 30 x 50 feet convenient accommodations for a family can be provided and ample ventilation secured. The general statement in regard to the necessity for improvement in American houses is undoubtedly correct, and every judicious effort to influence public opinion in this direction should be gratefully received; but the particular illustration given in this case, in my judgment, is by no means as free from objections as its author apparently believes, and, as "Harper's Magazine" is widely circulated, you will perhaps permit me to point out some particulars in which it should not be adopted as a model.

We have presented to us a two-story and basement house, from thirty to forty feet wide and fifty feet long, which provides kitchen, laundry, six or seven bed-rooms, and two large living-rooms, with conservatory attached. Such a house is unlikely to be built by the head of a family who is not tolerably well-to do in the world, and who cannot afford to keep at least one servant. Most men, at least, would, I am confident, prefer a smaller house with some help to keep it in order, to a house of this size without any assistance except from members of the family. Yet the plan provides no way a servant to pass from the kitchen to the front door to let in a visitor or even to reach her bed-room, when she desires to make herself tidy after her work is done, without passing to and fro through the rooms occupied by the members of the family and their guests, or through the bath-room, etc., which is located in the center of the building.

Although the dimensions of the house seem liberal, the first prospect on entering the main hall is a wash closet—not in any subordinate position, but directly opposite the front door—between the living room with conservatory attached and the principal stair-case, which is intended to be enclosed on both sides, as is usual in attic or basement stairs, and which will therefore present a cramped, illiberal appearance. In a house containing many different apartments, each room may be occupied by but one person; the stair-case, however, is the common avenue of communication for all, and it is an error to crowd and contract it with the hope of thereby adding to the value of the accommodations as a whole.

The kitchen connects directly with the dining-room by two doors, yet the large dimensions given do not call for this uncomfortable arrangement.

But the most disagreeable feature of the plan, considering it as a professedly complete arrangement in matters of ventilation, is the placing of the bath-room and necessary in the very centre of the house, where it would be unlighted except through glazed openings that merely connect with halls or passages, and where a current of fresh air could only be obtained by opening doors that ought to be always closed.

The writer and the editors probably believe in all sincerity that the difficulties of the problem are fairly met and solved in this design; but the few prominent inconsistencies that have already been pointed out will be sufficient to show that this is not the case, and that the plan as presented, however well intended, is ill-conceived and by no means suitable for adoption by those who may be fortunate enough to possess the money that it would cost to build such a roomy family residence.

A.

Fine Arts.

THE FORTY-FIRST EXHIBITION OF THE NATIONAL ACADEMY OF DESIGN.

[THIRD NOTICE.]

IT is a growing custom to send important pictures elsewhere for exhibition than to the Academy. We have no business now with the reasons for this tendency, nor, indeed, are the reasons sufficiently evident for any one to be quite sure that he perceives and duly estimates them all. It is only to be remarked that a complete account of the last winter's work of the artists even of New York and its neighborhood would only be possible after an examination of perhaps as many pictures not in this exhibition as there are important, notice-worthy pictures in it. The greater number of our painters, so far as we know, are open to the charge of producing less work *per annum* than the world has a right to expect of them. When, of the already too small amount of work done, a part goes elsewhere than to these galleries and another part is never exhibited at all, there is a difficulty, an insuperable difficulty, in the way of adequate criticism. It is impossible to be sure that the judgment which comes of examining a painter's work in the Academy exhibition would not be much changed if all his year's work could be seen. And, if it were not now too late to attempt it, an extensive examination of all the new pictures anywhere to be publicly seen would be the duty of the critical press.

Mr. McEntee, however, has three pictures at the Academy, and they are so able that it is good to believe they fully represent his present power as a painter. The merit of his pictures seems to be steadily in the ascendant. Of the almost complete truth of color which his former studies of autumn woods have shown, these present studies of autumn woods have lost nothing. They have, we think, all of the feeling for the mingled desolateness and beauty of the American autumnal landscape which Mr. McEntee's work has shown in past years. The sky in No. 356, "Woods of Asshokan," is singularly true in feeling; the foliage is almost right in color, especially in the distance, and we are not prepared to assert that in this one respect the picture could be improved by the knowledge or skill of any living artist. Beyond these merits, which have been merits of nearly all Mr. McEntee's pictures these few years past, there is a care for detail in these and a respect for accurate drawing for its own sake—or rather for the sake of the things drawn—which we are sincerely glad to see. The foreground in the above-named picture is a great advance beyond anything of this painter's we have ever seen, especially in the care given to the little plants—lobelia, ferns (dry and yellow), and little maple saplings with crimson leaves. The advance is

in McEntee's own line, too, nothing borrowed of any one else or studied in any one else's way, but nature looked at and drawn as this painter has always looked and drawn, but more carefully and more truly. In saying this we have no intention of calling the drawing of tree form absolutely right; it is by no means wholly right, but mannered and often visibly wrong. And even a better picture than this would suffer from such a blot as that in the lower left-hand corner of the picture above named, where some pine bushes, just at the edge of a brook, are wholly ignored by the water, whose reflections, otherwise truthfully represented, are wholly uninfluenced by the green mass just above them. This hurts the effect as well as the truthfulness of the picture. The brook is otherwise very charming. No. 392, "October in the Kaatskills," we think inferior to the former picture, though its characteristics are the same. The peep of sunlight, illuminating both a spur of the mountain range and a nearer and much lower hill, is very charming. But this is in no respect an adequate rendering of the mass and the details of form of the Catskill range. It happens that good mountain drawing is a specialty of the best American landscape painters, and beside the *best* mountain drawing, Mr. McEntee's is very imperfect.

No. 449, "Flight of the Birds," is also a pleasant landscape, smaller than the two above named. A tree almost without leaves is in the foreground, its naked branches covered with birds preparing for their migration, and a scattered column already on its march. About these birds there is one thing noticeable, the mingling together in this mustering for the march of birds of so many different kinds, blue birds and red birds, yellow birds and gray birds. Individuals of many species are included in this gathering of the clans. To justify as natural this statement—and not less to declare it wholly impossible—would require a very close and accurate knowledge of the ways of birds.

Mr. C. C. Griswold sends two pictures; the larger is another winter picture called "The Last of the Ice," No. 312. A stretch of what seems the Hudson River is shrouded in mist, lifting a little from the surface of the water but wholly concealing the hill-tops, the profiles of the hills dimly seen below, and lost in nothingness above. On a low shore in the near foreground are broken cakes of ice aground, and a few, water-soaked and floating deeply, are drifting with the tide. There is, perhaps, something too little incident for so large a canvas. But the painter's strength comes to him and his success is assured when he touches his favorite rocky bank and cedars again; here it is, in the middle distance and at the extreme left. It is no wonder he loves that subject; it is worth painting, and he has painted it wonderfully well. A scribble of his of a winter hill side, in oil color, on a bit of paper, is worth more than pictures by many men. Green pictures he has not yet painted with great success, but No. 463, "A Summer Picture," is very beautiful in all except the near foreground. The belt, so to speak, of middle distance, ending with the white house on the right, is charming. But that unfortunate spotty tree in the foreground, beneath which we see the white house, and the mulleins still nearer, hurt the whole picture. It is more welcome to us than the larger one, however, and one of the few good because thoughtful landscapes in the exhibition.

In comparing the memory of Mr. Brevoort's study, exhibited last fall, which we have not seen since, with the presence of the two pictures now in the North Gallery, the advantage is with the study. It was purer and truer in color than these are, and better, we think, in other respects as well. There is something peculiarly disagreeable in the tone of color, especially, of No. 215, "Haymaking." We do not use the word "leathery," as it seems to lack exactness of meaning when applied to color, but it has been used of the prevailing color of this picture, and it is evident what it is intended, in this case, to mean. Natural landscape was never pervaded by the yellowish-brown tone of this picture, and it is a false and misdirected operation of the artist's mind to alter nature in this way, out of which no beauty comes nor knowledge. The other picture, No. 167, "In the Farmington Valley, Conn.," is a more interesting picture, though the sky is probably less carefully studied. We sincerely believe that Mr. Brevoort is going to succeed, but it is not success this spring.

Mr. Cropsey has painted several panoramic pictures of late years, all open to the charge of being too scattered in interest, too unharmonious, an aggregate of small and incoherent parts, but generally worth study part by part. The large "Gettysburg" this year, No. 409, is as panoramic as those which went before. One walks along in front of it using many points of sight. But it is otherwise almost wholly below Mr. Cropsey's standard. It is incredibly bad in color. Anything worse than the sunset light on trees and buildings there is not in the exhibition, among works of men of any merit. This is at its worst in the very centre of the picture, at the foot of the flag-staff in the foreground. There is no delicacy of drawing to be found anywhere on the broad canvas. But the rest of the picture seem quiet and refined in contrast with the rumpled flag, which neither floats nor flutters nor blows out nor falls, but crinkles and gets "mussed" in the summer breeze. We are heartily sorry to see this picture here, and wish the committee had been kinder to Mr. Cropsey and sent it back for his further consideration.

It is a very great evil, the painting of very large pictures with very little thought in them. And the evil is greater where not only the amount of canvas covered, but also the amount of labor given, is in excess. The picture last named has very little in it; a great many trees, indeed, a great many houses, a big flag, and a couple promenading, but all very uncommunicative, with very little new or interesting to say. All could have been better said in a canvas two feet long; better, because, with no greater excellence, the defects would not be so evident nor the faults so glaring. "But it is a historical landscape, a picture of the great National Cemetery at Gettysburg, famous from the noble words of our dead President spoken at its dedication." Not so; it has none of the importance of a historical landscape; we have yet to learn that a bad account of great events is true history, or that an inferior picture of a somewhat interesting scene, around which scene historical associations cluster, is necessarily historically valuable. The historian makes but a poor figure unless he is filled with thought and sympathy for his subject; now it is not a profound thought or a ready sympathy that has gone to the making of this large picture; neither of the landscape itself, nor the clustered graves of soldiers, nor the national flag, nor the human figures that blot the right hand foreground.

Mr. Cropsey is a better painter than he would have the world believe.

We notice with pleasure Mr. D. Neal's picture, No. 149, "Interior of St. Mark's, Venice." The interior of that loveliest of churches—roofed with gold, floored with agate—enclosed with walls of half-transparent alabaster—is a subject for the painter of importance and difficulty almost equal to out of-door nature itself. We do not say that Mr. Neal has perfectly rendered the mellow gloom of the dusky interior, the purple flushes that come and go around the precious shafts and along the alabaster-sheathed piers.

A score of painters have tried and failed to do that. But Mr. Neal's picture is the best view of the interior we have yet seen, giving an adequate idea of the construction, appearance, and size of the strange building, and portraying with singular sympathy and success the Byzantine mosaics of the vaults. To those who know the interior of St. Mark's well and feel its beauty this picture would be of little use, but the many who have never seen or scarcely looked at it may learn much of it from the canvas before us.

BOOKS OF THE DAY.

CHARLES SCRIBNER & CO.

LANGE'S COMMENTARY ON MATTHEW. Edited by Rev. Philip Schaff, D.D. 8vo. Adv. p. 588. Repub. $5 00
